

Organisation of DRD4

Peter Krizan and Christian Joram
JSI Ljubljana CERN

Community Meeting

16 and 17 May 2023

Tentative Programme for Community Meeting

Tue, 16/05, morning, 0.5h

- Introduction, the Roadmap, purpose of the meeting, timeline, results of survey

Session Photodetection,

- SiPM, SPAD, PMT, MCP 12 talks

Session Technologies

- **Materials** 3 talks
- **Software**

Session Particle ID 6 talks

- RICH/DIRC
- TOF/TORCH

Social dinner

Wed, 17/05

Session 'blue sky', special, etc. 3 talks

Session Organisation 1

- Introduction
- Presentation of groups and their interests

Session Organisation 2

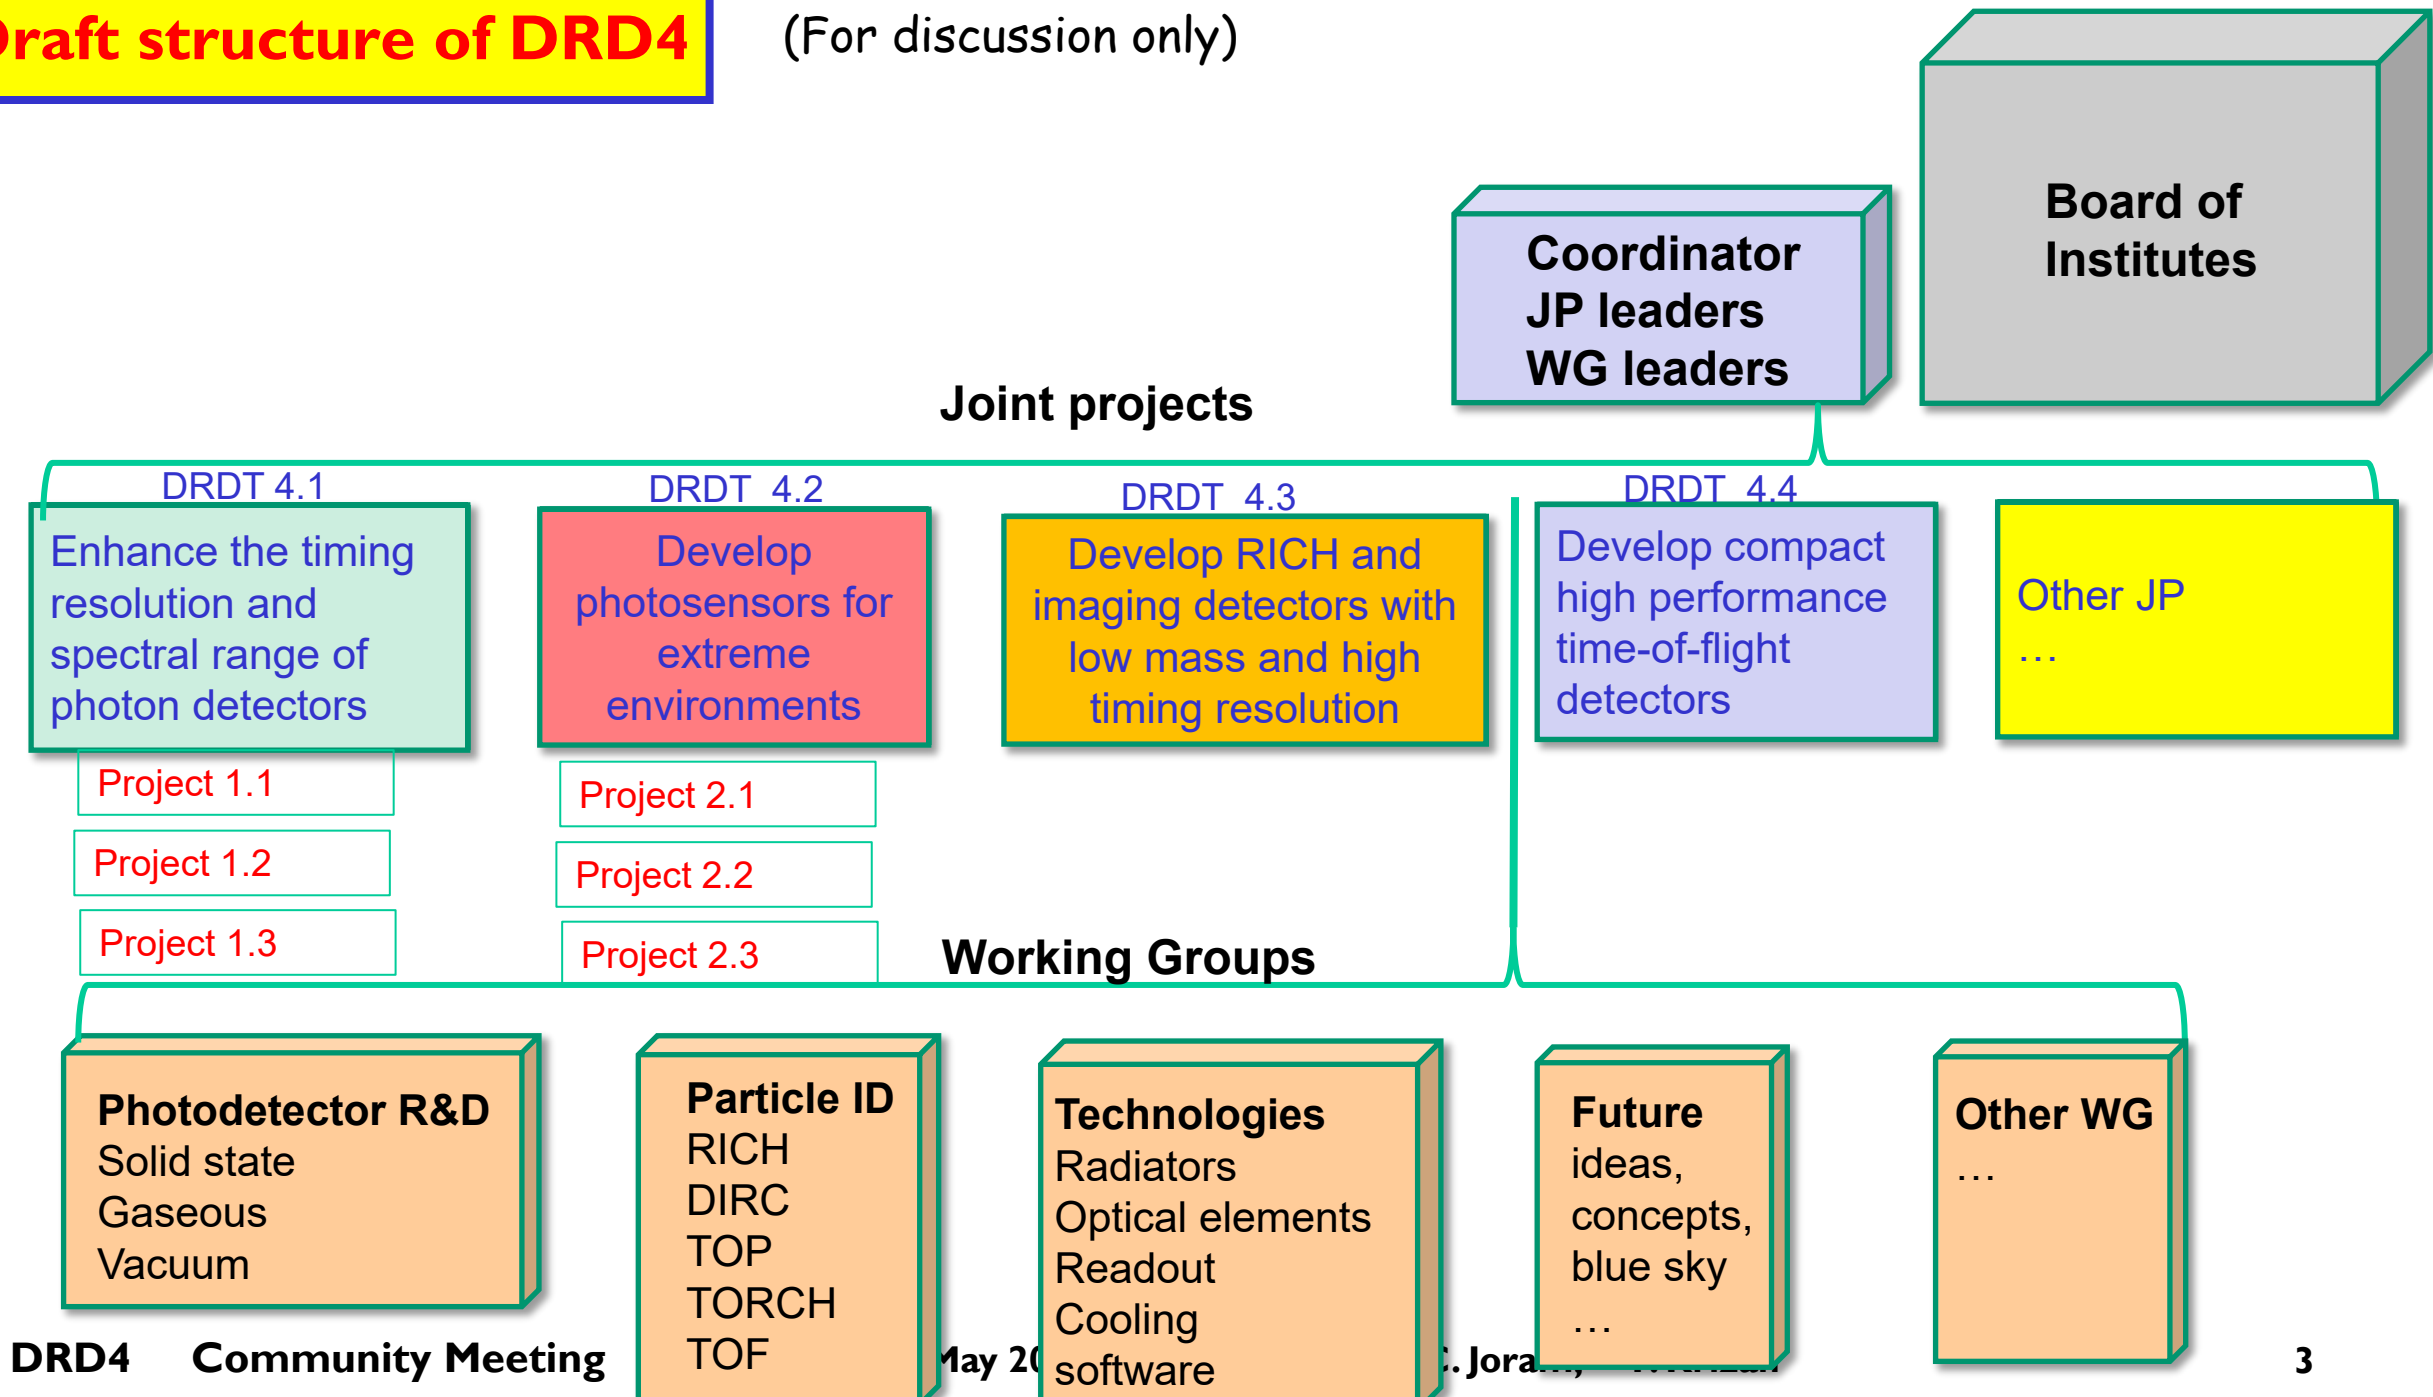

- Structure of DRD4
- Which WPs? Scopes ?
- Financial
- Common projects

Session Organisation 3

- Proposal, content, timeline, signatories
- Contributors

Draft structure of DRD4

(For discussion only)

Vote: Scope and Structure of DRD4.

Voting procedure:

- Open vote
- Persons present in room and by zoom
- Every person has 1 vote
- Aim for absolute majority

Scope: Photodetectors (single photon sensitive), Particle ID *RICH, TOF, TOP, TORCH, Scifi tracking

- In favour
- Against
- Abstention
- Alternative proposal

Structure: Working groups and Joint Projects (names may still change)

- In favour
- Against
- Abstention
- Alternative proposal

Vote: Working groups, their scope, modus operandi

Working groups

1. Photodetectors
2. Particle ID
3. Technological
4. Software
5. Future (incl. SciFi, may be split at a later stage)

- Forum-like mode
- Loose cooperation without agreed milestones, commitments, budgets
- A convenor (+ deputy) organises meetings (few per year), stimulates activities
- Joining/leaving without formalities

Vote

- In favour
- Against
- Abstention
- Alternative proposal

Photodetector R&D

Solid state
Gaseous
Vacuum

Particle ID

RICH
DIRC
TOP
TORCH
TOF

Technologies

Radiators
Optical elements
Readout
Cooling
software

Future

blue sky
SciFi
...

Vote: Joint projects, their scope, modus operandi

Joint Projects in 4 themes (4 themes should/must follow Roadmap)

- 1) Enhance the timing resolution and spectral range of photon detectors => **High Performance Photodetectors**
 - 2) Develop photosensors for extreme environments => **High Longevity Photodetectors**
 - 3) Develop RICH and imaging detectors with low mass and high timing resolution => **Fast Imaging Cherenkov**
 - 4) Develop compact high performance time-of-flight detectors => **High Performance TOF**
- **Project mode**
 - **Cooperation with agreed goals, milestones, commitments, budgets**
 - **A convenor (+ deputy) organises (more frequent) meetings, tracks progress, stimulates activities**
 - **Procedure/approval for joining/leaving**

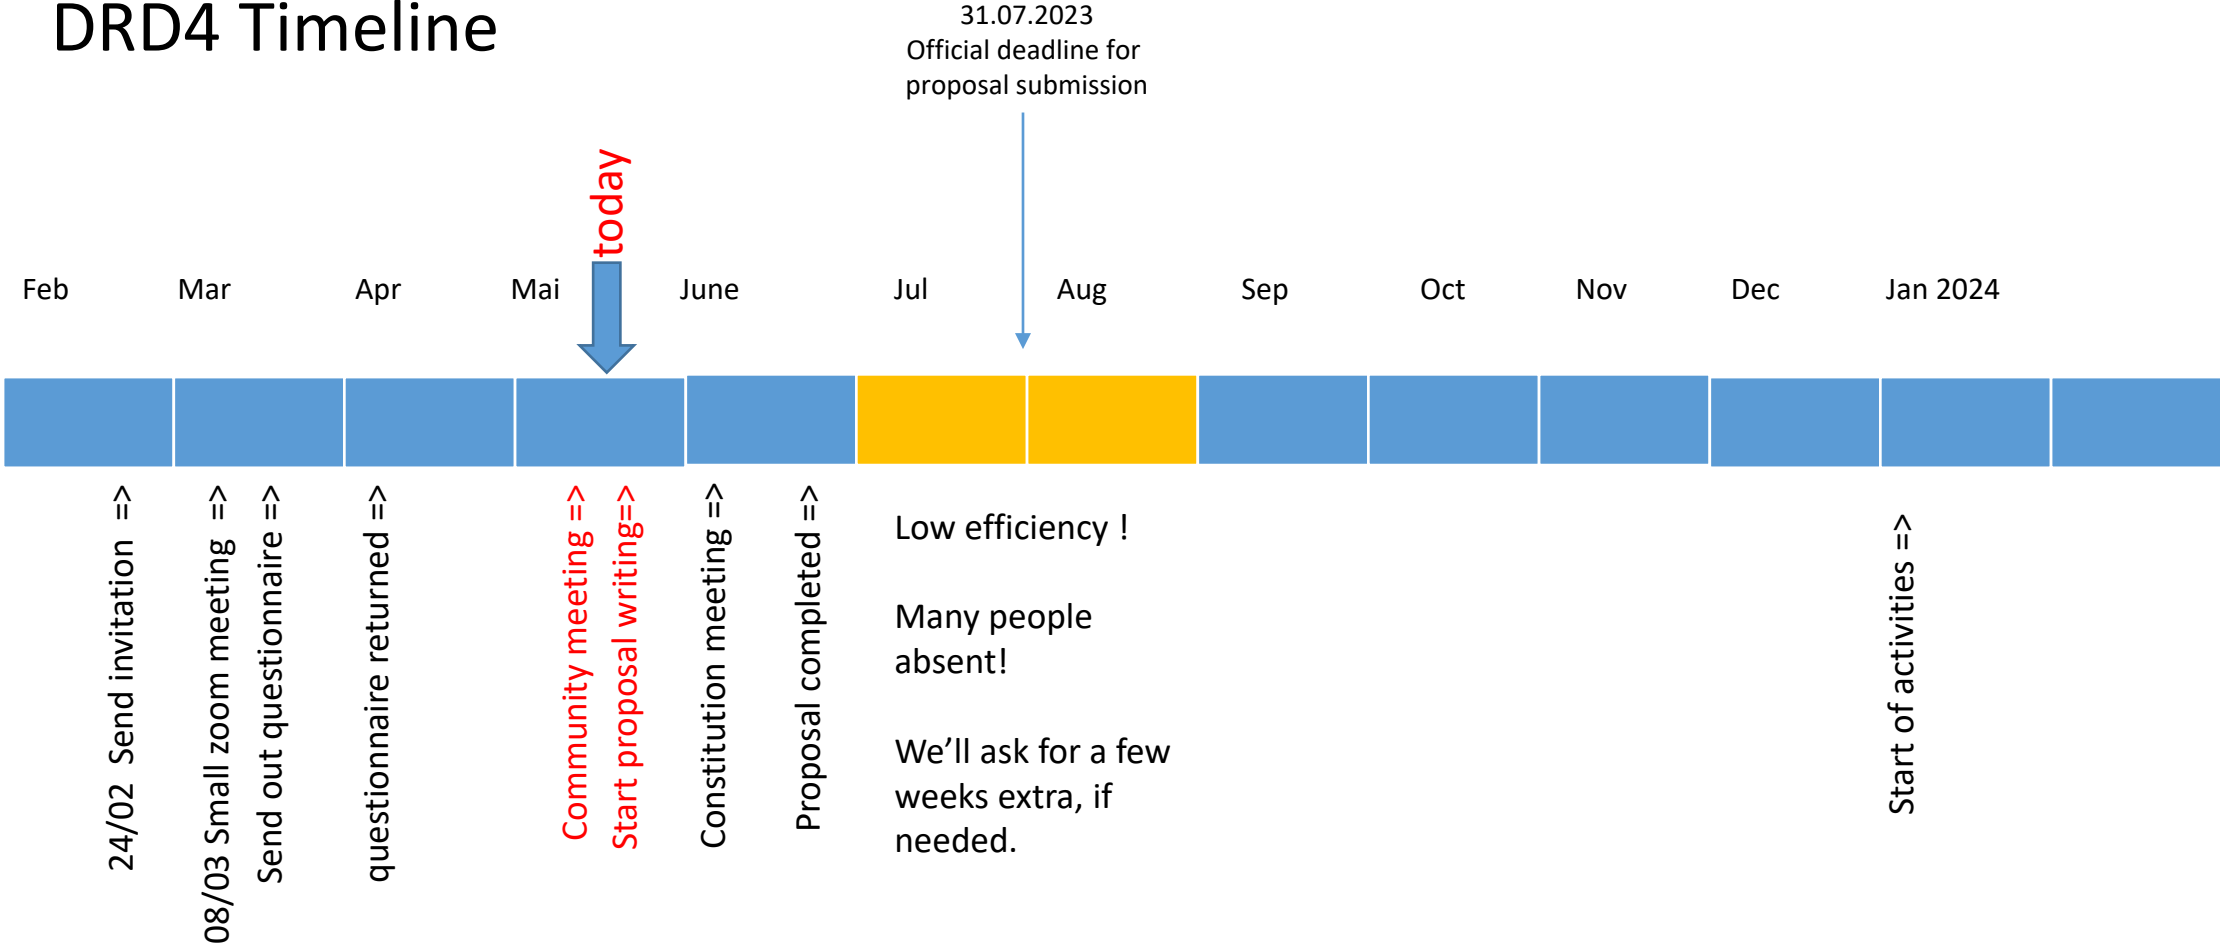

Vote

- **In favour**
- **Against**
- **Abstention**
- **Alternative proposal**

Financial

- ❑ Financial arguments are often used to motivate the formation of DRDs
- ❑ Funding Agencies (FA) should have heard of this European-wide effort and hopefully react favourably to your requests
- ❑ ‘DRD’ shall be a kind of R&D quality label, telling the FA that this is highly relevant and monitored R&D.
- ❑ Still, at least in the initial phase, resources will be tight and we depend on already financed R&D which the groups continue to perform, but now under the umbrella of the ECFA roadmap.
- ❑ The groups remain responsible and in control of their resources. Contributions will not be mutualised.
- ❑ We propose to create a small Common Fund based on a small member fee (e.g. 1000 CHF per institute). This will allow to organise meetings (coffee breaks, dinner?), send someone to a conference to give a DRD4 talk (in case no other funding is available), etc.
- ❑ DRD4 shouldn’t require huge funds (compared to DRD3 or DRD7 which need to pay expensive Si/ASICs submissions).
- ❑ For specific financial questions, please contact Phil Allport or Karl Jakobs.

DRD4 Timeline

Next steps

- **We aim for proposal submission by the end of June**

- **We will contact all groups next week and ask**
 - **Which WG do you want to join (at least 1) ? What is your main contributions and interests (mention one per WG)?**

 - **Which project do you propose in which of the 4 themes ? Provide a few lines of justification**
 - **Provide answer by 28 May**

- **Based on the answers we will draft a work plan. For every proposed projects we will ask the involved groups to prepare a description of the project and fill the resource table (As far as information is available)**

Next steps

- **Proposal writing. Try to limit effort. Recommended length 20 pages. Motivation, goals ... refer to Roadmap. Need to fill WG and more importantly JP with life and substance.**
- **Outline/template available. ECFA DRDC panel should update it.**
- **We must start now. We need your help!**
- **Are there volunteers who are prepared to describe one of the Working Group activities?**
- **Are there volunteers willing to organise the proposals of one theme ?**

DRD4 Collaboration Proposal – layout following a suggested template

Abstract

Introduction (objectives of the DRD4 collaboration)

(make use of the introduction of the TF4 chapter in the RD Roadmap, shortened)

Scope of the DRD4 Research Work

Planning technology area 1: DRDT 4.1 - Enhance timing resolution and spectral range of photon detectors

(including a task/deliverable synoptic, resources and list of contributing institutes)

Planning technology area 2: DRDT 4.2 - Develop photosensors for extreme environments:

(including a task/deliverable synoptic, resources and list of contributing institutes)

DRD4 Collaboration Proposal – layout 2

Planning technology area 3: DRDT 4.3 - Develop RICH and imaging detectors with low mass and high resolution timing.

(including a task/deliverable synoptic, resources and list of contributing institutes)

Planning technology area 4: DRDT 4.4 - Develop compact high performance time-of-flight detectors.

(including a task/deliverable synoptic, resources and list of contributing institutes)

Common simulation tools and test facilities

Partnerships (industrial, other research areas, other applications)

Networking and training

Proposal for the collaboration structure

Table 1: timeline

Timeline of milestones and major deliverables per DRDT and technology					
Deliverables or milestones in appropriate years	2024	2025	2026	2027-2029	≥ 2030
DRDT 1					
Technology 1	List of deliverables in year due (if any)				
...					
Technology n	List of deliverables in year due (if any)

Table 4: community input estimates

Proposed DRD input request to the community per DRDT				
Description/timeline/resources	Technology Deliverable 1	Technology deliverable n
DRDT 1				
Description of technology				
Strategic program(s) target				
Performance target				
Planned date, 2024-2025-2026, 2027-2029, ≥ 2030				
Existing R&D framework and/or list of contributors				
Description of contribution to the technology deliverable				
FTE contributions already covered or expected to continue				
"Materials" funding already covered or expected to continue				
Proposed FTE that would be needed to cover longer term strategic aspirations (≥ 2027)				
Proposed "Materials" that would be needed to cover longer term strategic aspirations (≥ 2027)				
...				
DRDT n				
Description of technology				
Strategic program(s) target				
Performance target				
Planned date, 2024-2025-2026, 2027-2029, ≥ 2030				
Existing R&D framework and/or list of contributors				
Description of contribution to the technology deliverable				
FTE contributions already covered or expected to continue				
"Materials" funding already covered or expected to continue				
Proposed FTE that would be needed to cover longer term strategic aspirations (≥ 2027)				
Proposed "Materials" that would be needed to cover longer term strategic aspirations (≥ 2027)				

Table 4 Suggested Template to Collect Community Input estimates. (A technology deliverable is a contribution to a physical object, it can be a component or a dedicated study prepared in collaboration with other contributors.)

Next steps

- **MoU writing. Try to limit effort. Not clear whether ECFA DRDC will provide a template. In the meantime, we use the RD50 MoU as a model.**
- **Idea (by DRDI): Lightweight MoU plus Annexes for Joint Projects**
- **It seems that we can submit the R&D proposal end of July and the MoU later in autumn.**
- **Should we have a DRD4 constitution meeting in 1 month from now?**
- **Proposal June 15. By zoom ?**
- **=> Finalise proposal and MoU**
- **=> Constitue proto-collaboration**

A very productive meeting

- Lots of useful discussions
- A big step towards forming the DRD4 Collaboration

A tight schedule ahead

- DRD4 internal proposal deadline **end of June**
- DRD4 Collaboration constitutional meeting: **June 15 via zoom**
- Groups submit their interest in **Working groups and propose projects: deadline May 28**

Thanks

- ... to the colleagues at **CERN** for their support!

Safe trip back home!

SPARE SLIDES

Tentative participation to Working Groups

Working groups

1. Photodetectors
2. Particle ID
3. Technological
4. Future (incl. SciFi, may be split at a later stage)

Large accelerator-based facility/experiment earliest feasible start dates

Smaller accelerator and non-accelerator-based experiments start dates

Family of vacuum-based photodetectors

A number of photon detector types have evolved from the classic photomultiplier concept :

- Micro-channel plate detectors (MCP-PMTs)
 - Several suppliers : eg. LAPPD (large area) and Photonis/ Hamamatsu/ Photech (compact, tunable granularity) – see next slide
- Photo-multipliers (including large areas)
 - Improvements needed to increase radio-purity (factor 5-10), UV response & QE
- Multianode (MaPMTs)
- Hybrid avalanche photon detectors (HAPDs)
- Hybrid HPDs, V-SiPMT etc

Gas-based photodetectors

- Gaseous Photon Detectors (GPDs) represent an effective solution for instrumenting large imaging surfaces (up to several square metres) in high magnetic fields.
- Need to develop GPDs based on Micro Pattern Gaseous Detector (MPGD) structures which allow photon conversions at few 10's of micron level.
 - Further R&D to improve the photocathode lifetime (GHz rates for EIC), the PDE, radiation hardness and time resolution in the few ps range (PICOSEC-Micromegas Detector Development); challenging extension to the visible spectral range.
- Search for UV-sensitive materials more radiation-hard and chemically inert than CsI.
 - Carbon based photocathodes
- Develop compact GPD systems with integrated electronics for imaging applications
 - InGrid - Micromegas integrated in a Timepix
- R&D for alternative hydrocarbon-free gas mixtures
- GPDs for cryogenic applications
 - Detection of both scintillator light and ionization

SiPMs : R&D technology requirements

- A non-exhaustive list – different applications, different requirements:
 - ❑ Improved radiation hardness (1×10^{14} n cm⁻² eq @ CMS ; 10^{17} - 10^{18} @ FCC-hh !)
 - ❑ Improved dark count rates towards 1 Hz mm⁻² (driven by low light-level experiments) and reduced after pulsing
 - ❑ Improved timing characteristics (aspire to 10 ps or below for time resolution)
 - ❑ Increasing photon detection efficiency for single-photons : fill factor and spectral range into the UV & IR
 - ❑ Cryogenic operation of SiPMs : improved cooling systems (to reduce dark noise), @ -50 °C
 - ❑ Optimised SiPM systems - large-area integration with cooling
 - ❑ Optimised optical couplings. development of micro-lenses/filters.
 - ❑ New materials for SiPMTs (eg SiC, GaN, InGaN, AlGaN)
 - ❑ Improved dynamic range (driven by calorimetry)
 - ❑ Improved cross talk
 - ❑ Cheaper solutions for SiPMs (eg CMOS) for large area applications and high pixel density. Analogue vs. Digital
 - ❑ Improving pulse shape discrimination (neutrinos and non-accelerator); development of corresponding r/o electronics
 - ❑ High radioactive-purity for underground experiments, better than a few Bq/kg depending on material
 - ❑ Cell size, dynamic range, fill factor.

PID with dE/dx , TRD

- dE/dx resolution around 5% is routinely reached, in excellent conditions and with accurate calibration. Possible improvements
 - ❓ dE/dx resolution $\sim 5.4\% (LP)^{-0.37}$ with L length in m, P pressure in bar; the interest in the P term is renewed where excellent PID is needed together with a large mass of the gas (TPC-as-a-target). R&D topics: suitable gas mixtures for high-P operation, light pressure-containment vessels.
 - ❓ Cluster counting: dN_{cl}/dx resolution is potentially better than dE/dx (by a factor of 2). Cluster counting requires fast electronics and sophisticated counting algorithms, or alternative readout methods. It has the potential of being less dependent on other parameters. Cluster counting in time, cluster counting in space; R&D topics: wave-form sampling FEE with FPGA processing, 2D micropattern read-out.
- TRD: employed in several experiments, ATLAS, ALICE, AMS, CBM, EIC
 - ❓ Gas TRDs a mature instrument for PID at high energies. Due to the overlapping of the TR signal with the ionization, a precise knowledge (and simulation) of dE/dx is a must.
 - ❓ GEMs are making their way in the technique
 - ❓ An attempt has been made to improve cluster counting by means of a GridPix. Some improvement is possible, although not drastic. Potential improvement may be reached by differentiating the response to X-ray photons and to particle ionization → Extensive R&D required!
 - ❓ TRD imaging (e.g., with Timepix3)? (for hadron PID at very high energies)

Superconducting photodetectors

- Single photon detection technologies with superconductors
- Superconducting detectors for UV-midIR photons
 - TES: Transition Edge Sensor
 - SNSPD: Superconducting Nanowire Single Photon Detector
 - MKID: Microwave Kinetic Inductance Detector
- Example: nanowire detectors for dark matter detection; dark photons
- Work in progress relevant to HEP applications

Novel optical materials for fiber trackers

■ Scintillating fibres:

□ A cost-effective way of instrumenting large areas for charged particle tracking at relatively low material budget. With the availability of small-pitch SiPM arrays, high resolutions are possible (LHCb SciFi tracker upgrade)

■ Further advances in the technology, e.g. for a second upgrade of the tracker envisaged for the High-Luminosity LHC:

□ Optimize photo-sensor and optical fibers need to be optimised for a higher light yield, allowing for smaller diameters and thus higher precision and improved radiation tolerance.

■ Open issues:

□ Radiation tolerance, speed, emission spectrum

■ Innovative materials: Nanostructured-Organo-silicon-Luminophores (NOL) scintillators:

□ Exhibit stronger and faster light output than presently achieved.

□ Decay time: NOL fibres are almost a factor 2 (6) faster than the best blue (green) standard fibres, which makes them very interesting for time critical applications

□ Radiation hardness (X-rays to a dose of 1 kGy): damage is as expected on a level comparable to reference fibres

Proposed implementation timeline

- **Starting now** : the R&D Roadmap Task Forces will organise open meetings to establish the scope and scale of the communities wishing to participate in the new DRD activities. DRD conveners and team of experts identified. Where the R&D area has a DRDT already in operation, these need to be involved from the beginning.
- **Q4 2022** : Outline structure and review mechanisms agreed by CERN Council.
- **Through 2023** : mechanisms to be agreed with funding agencies, preparing for DRD collaboration funding requests.
- **By Spring 2023** : the DRDC mandate to be formally defined with CERN management; Core DRDC membership appointed.
- **Through early Summer 2023** : Conveners and experts prepare DRD proposals with work package structure which are then submitted.
- **Q4 2023** : DRD collaborations receive formal approval from CERN Research Board.
- **Q1 2024** : The new DRDs come into existence and operational for ongoing review of DRDs. R&D programmes underway.
- **Through 2024** : collection of MoU signatures to take place, with defined areas of interest per institute.
- **2024-2026** : Ramp up of new strategic funding and R&D activities in parallel to completion of current deliverables.
