

# Vector meson production as a tool to search for gluon saturation from pA to eA to UPC

Farid Salazar (INT @ U. Washington)

Workshop on the Physics of Ultra Peripheral Collisions  
Dec 12th, 2023

Based on

Vincent Cheung (Livermore), Zhongbo Kang (UCLA), FS (UCLA/LBL/INT), Ramona Vogt (LLNL/UC Davis)

2312.XXXX *[on-going work]*

# Outline

- Gluon saturation in a nutshell

More on saturation on Anna's talk

- Quarkonium production at RHIC and the LHC

An overview of extant results

- Quarkonium production at the EIC and UPCs

I will focus on direct quarkonium production

For diffractive see Björn's, Jani's, Martin's and Yajin's talks

Complete results from CGC + NRQCD

Correspondence to TMD framework and beyond

Preliminary numerical results for ep, eA and UPC

Taping into “genuine higher saturation corrections”

- Outlook

# Quarkonium as a tool to search for gluon saturation

Glueon occupancy is high at small- $x$  (high-energy) and it saturates

Glueons with transverse momentum  $k_{\perp} \lesssim Q_s$  (saturation scale) are suppressed

Imprint on particle production in high-energy collisions at low  $k_{\perp}$

$$Q_s^2 \propto \frac{A^{1/3}}{x^{\lambda}} \sim M_{J/\psi}^2$$

$$x_p = \sqrt{\frac{M_{J/\psi}^2 + P_{\perp}^2}{s}} e^Y \quad x_A = \sqrt{\frac{M_{J/\psi}^2 + P_{\perp}^2}{s}} e^{-Y}$$

Forward production  $Y \gg 1$

$$x_A \ll 1$$

# Color Glass Condensate

McLerran, Venugopalan (PRD 1993)

- Effective field theory for small- $x$  gluons sourced by large- $x$  partons

Color (QCD)

Glass (separation between slow and fast degrees of freedom)

Condensate (highly occupied system)

Large- $x$  partons act as a classical color source which generates a background field  $A_{cl}$

- Multiple scattering of partons with background field

Ayala, Jalilian-Marian, McLerran, Venugopalan (PRD 1995) Balitsky (NPB 1996)

High-energy scattering dofs = light-like Wilson line:

$$V(\mathbf{x}_\perp) = P \exp \left( ig \int dx^- A_{cl}^+(\mathbf{x}_\perp, x^-) \right)$$

# Color Glass Condensate

- Non-linear renormalization group evolution (BK-JIMWLK)

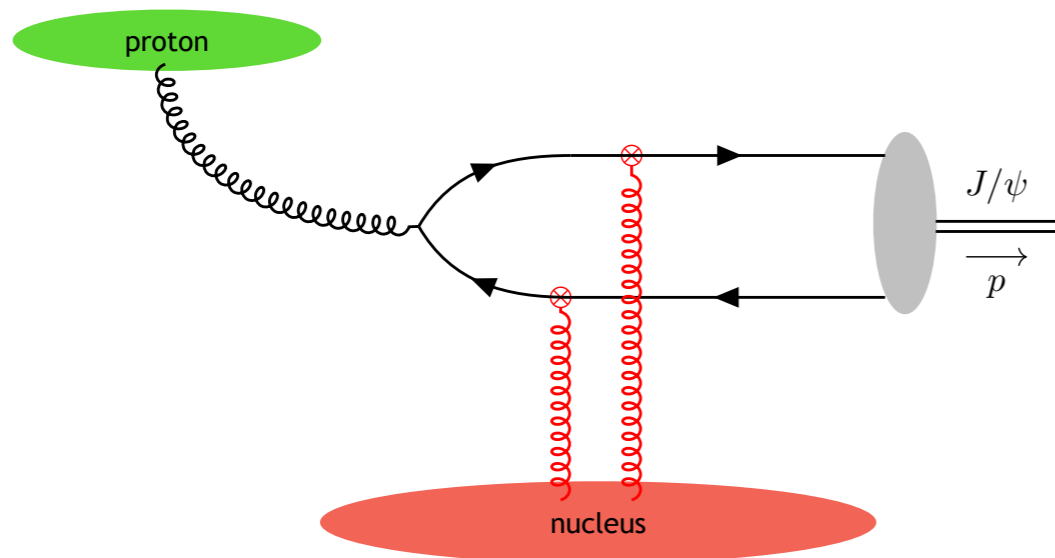

*Balitsky (1995), Kovchegov (1999)  
Jalilian-Marian, Iancu, McLerran,  
Weigert, Leonidov, Kovner (1996-2002)*

- Fast fields are non-perturbative, slow fields evolve perturbatively
- Probing CGC with dilute projectile  
= pQCD embedded in strong gluon (non-perturbative) background field

# Quarkonium production in proton-nucleus collisions

## CGC meets NRQCD

Non-relativistic QCD

Non-perturbative LDME

$$\frac{d\sigma^{J/\psi}}{d\mathbf{p}_\perp^2 d\eta} = \sum_{\kappa} \langle \mathcal{O}_{\kappa}^{J/\psi} \rangle \frac{d\hat{\sigma}^{\kappa}}{d\mathbf{p}_\perp^2 d\eta}$$

Decompose contribution into specific quantum state of the heavy quark pair

$$\kappa = 2S+1 L_J^{[c]}$$

S (spin), L (angular momentum), J (total angular momentum), c (color state)

Contributing to  $J/\psi$  production:  ${}^3S_1^{[1]}, {}^1S_0^{[8]}, {}^3S_1^{[8]}, {}^3P_J^{[8]}$

## Short-distance coefficients

$$\frac{d\hat{\sigma}^{\kappa}}{d\mathbf{p}_\perp^2 d\eta} = g(x_p, \mathbf{k}_\perp) \otimes \tilde{\Gamma}^{\kappa}(\mathbf{p}_\perp; \mathbf{l}_\perp, \mathbf{l}'_\perp, \mathbf{k}_\perp) \otimes \tilde{\mathcal{G}}^{\kappa}(x_A, \mathbf{p}_\perp; \mathbf{l}_\perp, \mathbf{l}'_\perp)$$

Proton UGD/TMD      Perturbative factor      Nuclear-dependent (CGC)

Kang, Ma, Venugopalan, Zhang (JHEP 2013)

# Confronting to RHIC and LHC data

Ma, Venugopalan (PRL 2014)

Ma, Venugopalan, Zhang (PRD 2015)

## Transverse momentum distribution

Proton-proton

Proton-nucleus

## Nuclear modification Ratio

CGC provides good description of experimental data at low  $p_T$  ( $p_{\perp} \lesssim Q_s$ )

# Confronting to RHIC and LHC data

Ma, Venugopalan (PRL 2014)

Ma, Venugopalan, Zhang (PRD 2015)

## Rapidity distribution and nuclear modification

Proton-proton

Proton-nucleus

Nuclear modification Ratio

Rapidity distributions are integrated over  $p_{\perp}$ , low  $p_{\perp}$  dominates the bulk of the cross-section

# Confronting to RHIC and LHC data

$J/\psi$  multiplicity vs charged hadron multiplicity

*FS, Schenke, Soto-Ontoso (PLB 2022)*

Sub-nuclear fluctuations in hotspots size and saturation scale provide a natural framework to generate different multiplicity classes that describe well LHC data

# What about electron-nucleus deep inelastic scattering?

Replace the proton projectile by an electron

Reconstruct kinematics of the “projectile” photon  
Electromagnetic probe -> cleaner theoretical calculation  
Possible to measure at the future EIC

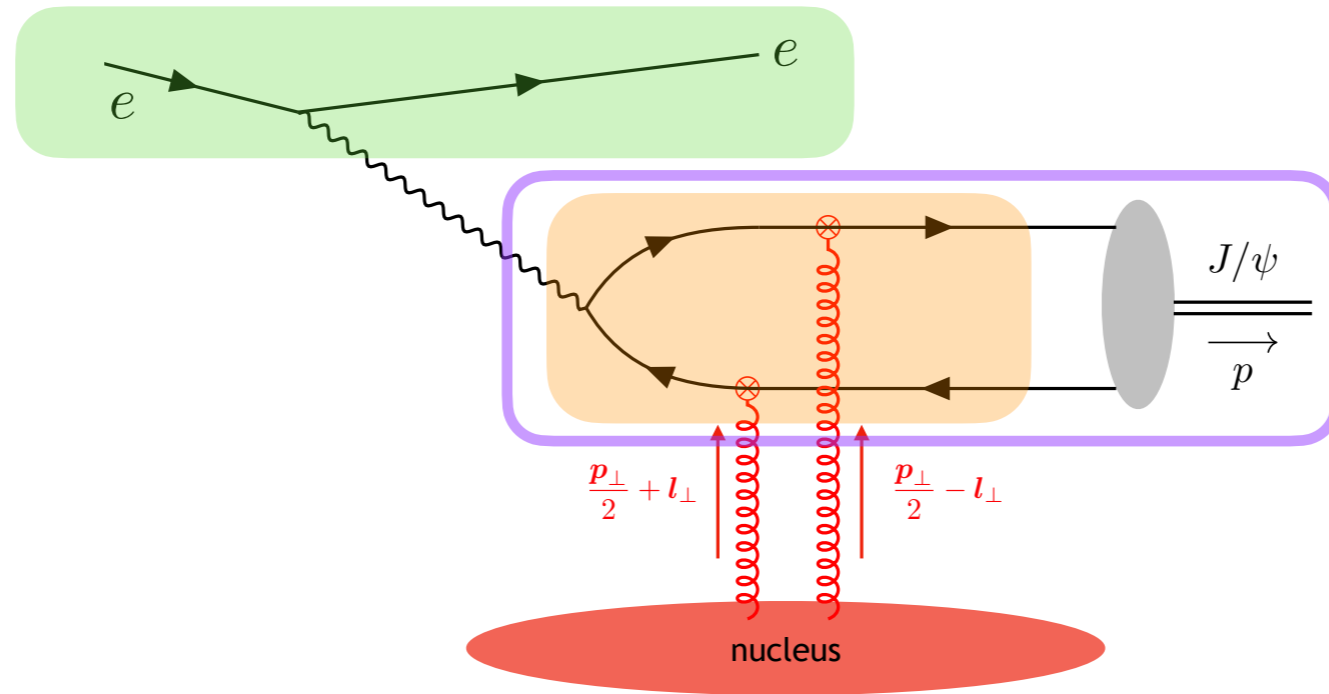

Surprisingly, calculations [in CGC] hadn't been done yet, not even at LO...

*Motivated our work in Cheung, Kang, FS, Vogt [2312.XXXX]*

# Quarkonium production in electron-nucleus collisions

## Lepton-hadron decomposition in polarization basis

Breit frame:

Following *Mantysaari, Roy, FS, Schenke (PRD 2020)*, decompose the DIS cross-section in terms of  $\gamma^*A$

$$\frac{d\sigma^{J/\psi}}{dx_{Bj} dy d\mathbf{p}_{\perp}^2 d\phi_{eJ/\psi}} = \frac{\alpha_{em}}{2\pi^2 y x_{Bj}} \left\{ f_L(y) \frac{d\sigma_L^{J/\psi}}{d\mathbf{p}_{\perp}^2} + f_T(y) \frac{d\sigma_T^{J/\psi}}{d\mathbf{p}_{\perp}^2} + f_{TL}(y) \frac{d\sigma_{TL}^{J/\psi}}{d\mathbf{p}_{\perp}^2} \cos \phi_{eJ/\psi} + f_{Tflip}(y) \frac{d\sigma_{Tflip}^{J/\psi}}{d\mathbf{p}_{\perp}^2} \cos 2\phi_{eJ/\psi} \right\}$$

$\phi_{eJ/\psi}$  is the relative azimuthal angle between electron and  $J/\psi$

# Quarkonium production in electron-nucleus collisions

## CGC meets NRQCD

Direct  $J/\psi$  production in  $\gamma^* A$  collision

Regge limit (small-x):

$$Q^2, M_{J/\psi}^2, p_{\perp}^2 \ll s$$

$$\frac{d\sigma_{\lambda}^{J/\psi}}{dp_{\perp}^2} = \sum_{\kappa} \langle \mathcal{O}_{\kappa}^{J/\psi} \rangle \frac{d\hat{\sigma}_{\lambda}^{\kappa}}{dp_{\perp}^2}$$

LDME for  $J/\psi$  production

Short-distance coefficients

$$\frac{d\hat{\sigma}_{\lambda}^{\kappa}}{dp_{\perp}^2} = \int \frac{d^2 l_{\perp}}{2\pi} \int \frac{d^2 l'_{\perp}}{2\pi} \tilde{\Gamma}_{\lambda}^{\kappa}(\mathbf{p}_{\perp}, Q; \mathbf{l}_{\perp}, \mathbf{l}'_{\perp}) \tilde{\mathcal{G}}^{\kappa}(x_A, \mathbf{p}_{\perp}; \mathbf{l}_{\perp}, \mathbf{l}'_{\perp})$$

Spin and polarization-dependent perturbative factor (20 functions)

Nuclear-dependent CGC distribution (Octet and Singlet)

$$\tilde{\mathcal{G}}^{\kappa}(x_A, \mathbf{p}_{\perp}; \mathbf{l}_{\perp}, \mathbf{l}'_{\perp})$$

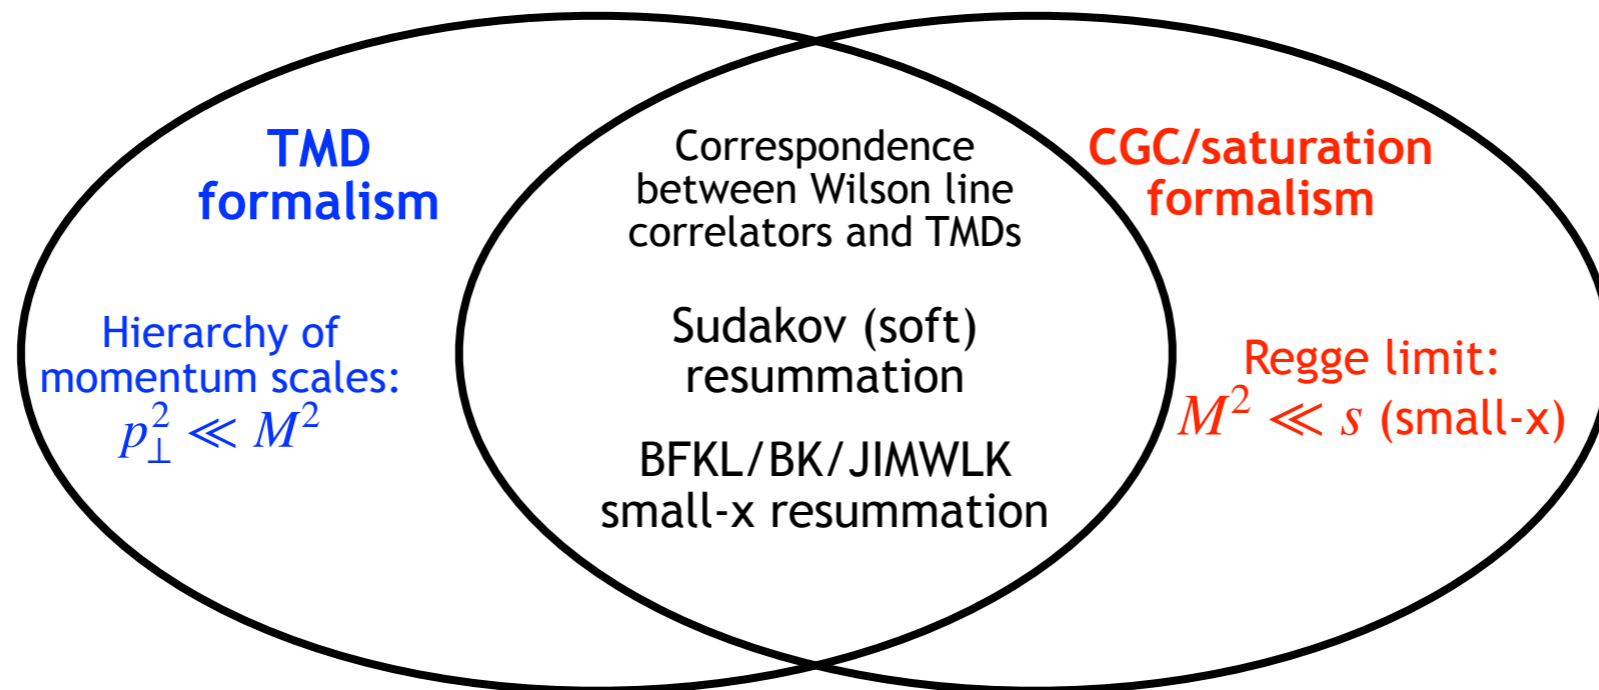

Built from Wilson lines. Encodes all the multiple interactions of the quark-antiquark pair with the nucleus. Implicitly depends on the saturation scale  $Q_s(x_A)$

# Quarkonium production in electron-nucleus collisions

## TMD factorization at small-x

Our result for Short-distance coefficients in CGC + NRQCD

$$\frac{d\hat{\sigma}_\lambda^\kappa}{d\mathbf{p}_\perp^2} = \int \frac{d^2\mathbf{l}_\perp}{2\pi} \int \frac{d^2\mathbf{l}'_\perp}{2\pi} \tilde{\Gamma}_\lambda^\kappa(\mathbf{p}_\perp, Q; \mathbf{l}_\perp, \mathbf{l}'_\perp) \tilde{\mathcal{G}}^\kappa(x_A, \mathbf{p}_\perp; \mathbf{l}_\perp, \mathbf{l}'_\perp)$$

In the limit:  $Q_s^2 \ll Q^2 + M_{J/\psi}^2$  and  $\mathbf{p}_\perp^2 \ll Q^2 + M_{J/\psi}^2$

Momentum-space expansion

$$\tilde{\Gamma}_\lambda^\kappa(\mathbf{p}_\perp, Q; \mathbf{l}_\perp, \mathbf{l}'_\perp) \approx \frac{\partial^2 \tilde{\Gamma}_\lambda^\kappa(\mathbf{p}_\perp, Q; \mathbf{l}_\perp, \mathbf{l}'_\perp)}{\partial l_\perp^\alpha \partial l'_\perp{}^{\alpha'}} l_\perp^\alpha l'_\perp{}^{\alpha'}$$

TMD factorization

$$\frac{d\hat{\sigma}_\lambda^\kappa}{d\mathbf{p}_\perp^2} = \underbrace{H_{\lambda, \alpha\alpha'}^\kappa(Q)}_{\text{Hard factor}} \underbrace{x G^{\alpha\alpha'}(x, \mathbf{p}_\perp)}_{\text{Weizsäcker-Williams TMD at small-x, implicitly depends on } Q_s}$$

Reproduces results by *Bacchetta, Boer, Pisano and Tael*s (EPJC 2018) within TMD factorization

The non-vanishing contributions in TMD are:  ${}^3P_1$  and  ${}^3P_2$  (for longitudinally pol photon) and  ${}^1S_0$  and  ${}^3P_J$  (for for transversely pol photon, Tflip )

# Quarkonium production in electron-nucleus collisions

## Improved TMD factorization at small-x

Our result for Short-distance coefficients in CGC + NRQCD

$$\frac{d\hat{\sigma}_\lambda^\kappa}{d\mathbf{p}_\perp^2} = \int \frac{d^2\mathbf{l}_\perp}{2\pi} \int \frac{d^2\mathbf{l}'_\perp}{2\pi} \tilde{\Gamma}_\lambda^\kappa(\mathbf{p}_\perp, Q; \mathbf{l}_\perp, \mathbf{l}'_\perp) \tilde{\mathcal{G}}^\kappa(x_A, \mathbf{p}_\perp; \mathbf{l}_\perp, \mathbf{l}'_\perp)$$

In the limit:

$$Q_s^2 \ll Q^2 + M_{J/\psi}^2$$

Expansion following *Boussarie, Mehtar-Tani (PRD 2021)*, *Boussarie, Mantysaari, FS, Schenke (PRD 2021)*

$$\frac{d\hat{\sigma}_\lambda^\kappa}{d\mathbf{p}_\perp^2} = \mathcal{H}_{\lambda, \alpha\alpha'}^\kappa(Q, \mathbf{p}_\perp) x G^{\alpha\alpha'}(x, \mathbf{p}_\perp)$$

Weizsäcker-Williams  
TMD at small-x, implicitly  
depends on  $Q_s$

“Improved ”Hard factor hard factor resums all corrections  $p_\perp^2/(Q^2 + M_{J/\psi}^2)$

Improved TMD only valid at leading power in  $Q_s^2/(Q^2 + M_{J/\psi}^2)$

# Quarkonium production in electron-nucleus collisions

pT dependence: CGC vs kT factorization (TMD and ITMD)

$$d\sigma_n = \int \frac{d\phi_{eJ/\psi}}{2\pi} d\sigma^{J/\psi} \cos(n\phi_{eJ/\psi})$$

$$e + p \rightarrow e + J/\psi + X$$

Solid line= full CGC  
Dashed-solid= Improved TMD  
Dashed = TMD

We use MV model (semi-classical) for Wilson line correlators and the gluon WW distribution.  
For proton we have  $Q_s^2 = 0.2 \text{ GeV}^2$

Small saturation scale ->  
ITMD reproduces well full CGC

The behavior of pT spectrum from ITMD:

$\ln(Q_s^2/p_\perp^2)$  for  $p_\perp^2 \lesssim Q_s^2$  TMD saturated

$1/p_\perp^2$  for  $Q_s^2 \ll p_\perp^2 \ll Q^2 + M_{J/\psi}^2$  TMD

$1/p_\perp^4$  for  $p_\perp \gg Q^2 + M_{J/\psi}^2$  kT factorization

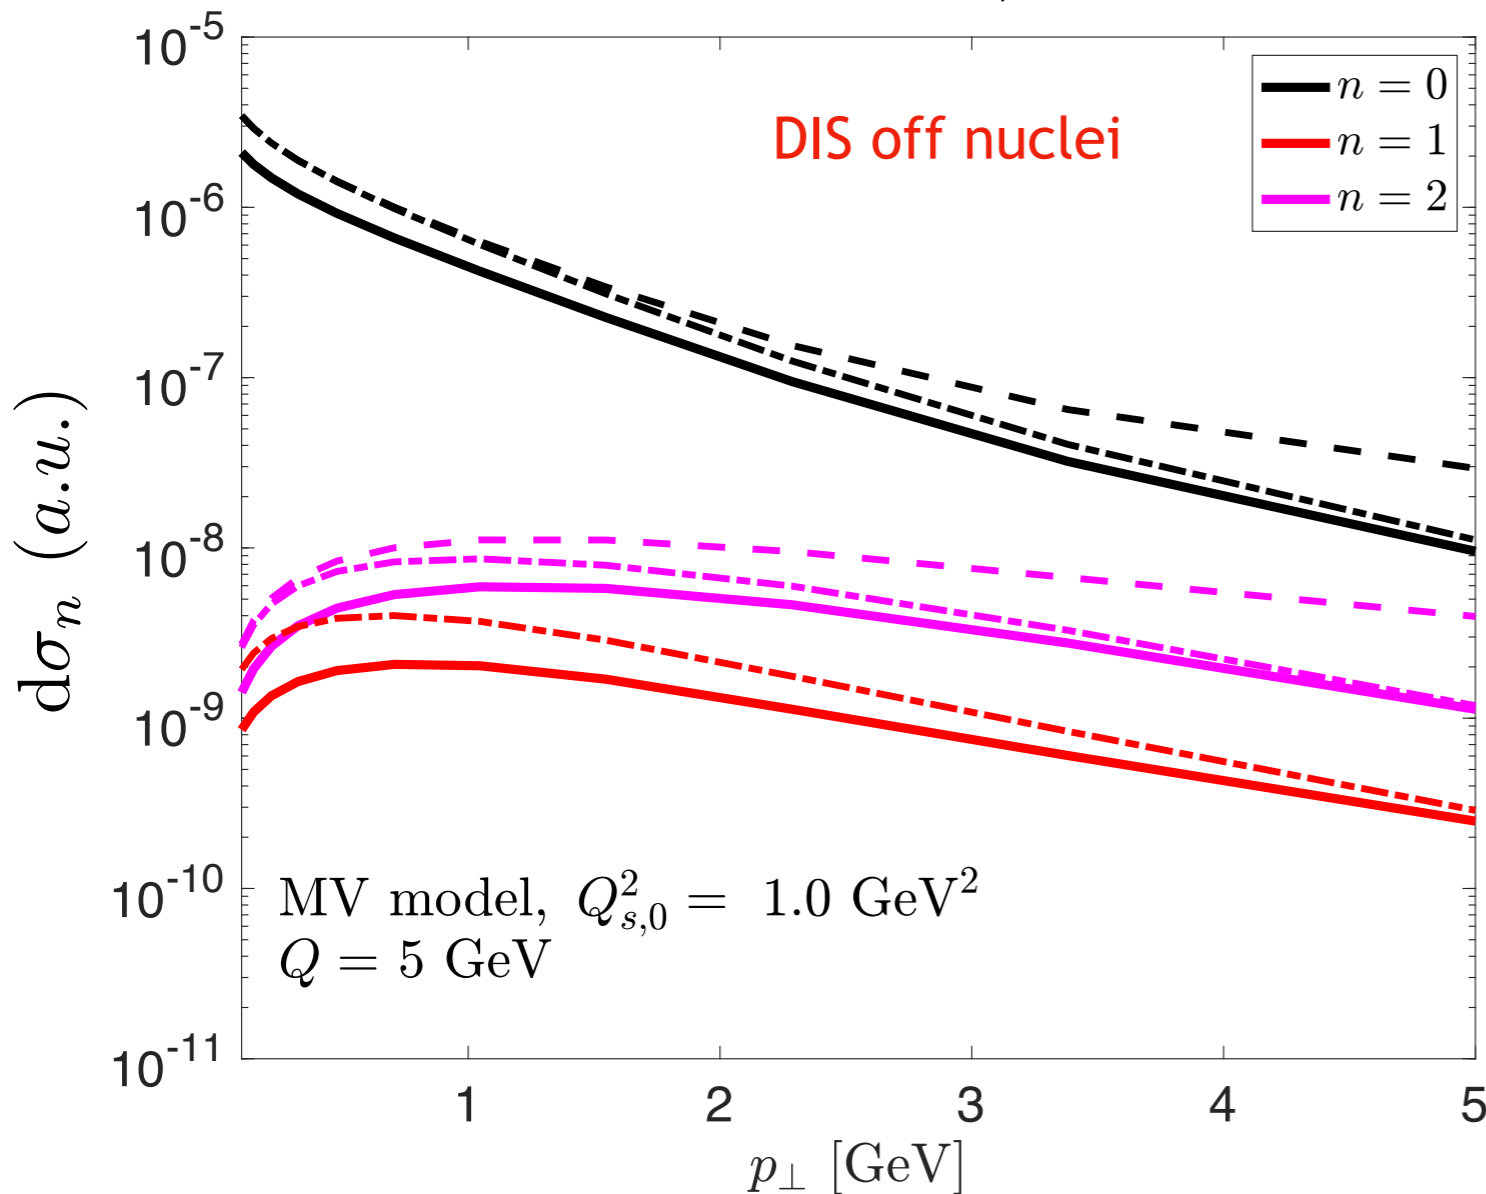

# Quarkonium production in electron-nucleus collisions

pT dependence: CGC vs kT factorization (TMD and ITMD)

$$d\sigma_n = \int \frac{d\phi_{eJ/\psi}}{2\pi} d\sigma^{J/\psi} \cos(n\phi_{eJ/\psi})$$

$$e + A \rightarrow e + J/\psi + X$$

Solid line= full CGC  
Dashed-solid= Improved TMD  
Dashed = TMD

We use MV model (semi-classical) for Wilson line correlators and the gluon WW distribution.

For proton we have  $Q_s^2 = 0.2 \text{ GeV}^2$

Further suppression of the spectrum in full CGC result from “genuine higher saturation contributions” that scale as  $Q_s^2 / (Q^2 + M_{J/\psi}^2)$

Similar effect was observed in dijets in *Boussarie, Mantysaari, FS, Schenke (PRD 2021)*. However, “genuine saturation corrections” in  $J/\psi$  production are

**stronger than in dijets** since

$$M_{J/\psi}^2 \ll M_{dijet}^2$$

# Quarkonium production in electron-nucleus collisions

Nuclear modification ratio eA vs ep

$$R_{eA} = \frac{1}{A} \frac{d\sigma_{eA}}{d\sigma_{ep}}$$

$$R_{eA}[v_n] = \frac{v_n(eA)}{v_n(ep)}$$

Full CGC displays further suppression in the nuclear modification factor as compared to TMD and ITMD.

CGC, TMD, and ITMD give similar predictions for ratio of anisotropies

# What about UPCs?

Replace the photon source (electron  $\rightarrow$  nucleus)

Photon is quasi-real, take  $Q^2 \rightarrow 0$  limit of our  $\gamma^*A$  results (only transverse polarization survives)

Improved TMD regime of validity is very narrow:  $Q_s^2 \ll M_{J/\psi}^2$

but for large nuclei at high energies  $Q_s^2 \sim M_{J/\psi}^2$  Need full CGC calculation!

$J/\psi$  production in UPCs could be very sensitive to “higher genuine saturation corrections” only present in the full CGC calculation

Better sensitivity than dijets since  $M_{J/\psi}^2 \ll M_{dijet}^2$ . Sudakov effect (soft radiation) should be smaller.

# Quarkonium production in UPCs

## Nuclear modification ratio in UPCs

Genuine higher saturation contributions have the largest effect in photo-production (e.g. UPC) which cause a large suppression of the cross-section and the nuclear modification ratio at low  $p_T$

# Summary and Outlook

- Past

CGC + NRQCD provided good descriptions of rapidity and  $p_{\perp}$  distribution, nuclear modification ratio, and multiplicity-dependence in high-energy pp and pA collisions at RHIC and LHC

- Present

We computed direct quarkonium production in eA and UPCs within CGC + NRQCD

We studied the connection between CGC to TMDs

$J/\psi$  production has better sensitivity to genuine higher saturation corrections than dijet production

- Future

Can we provide a good description of HERA data? UPCs? Predictions for EIC?

More realistic calculation (Sudakov, JIMWLK evolution, small-x initial conditions, uncertainty due to non-perturbative LDMEs, relativistic corrections)

Study polarized  $J/\psi$  production

Extend our results to NLO [First steps in this direction Zhongbo Kang, FS and Emilie Li, arXiv: [2310.12102](https://arxiv.org/abs/2310.12102)]
