## The ratio of Psi(2s) and J/Psi exclusive photoproduction cross-sections as a tool to detect non-linear QCD evolution

Wednesday 13 December 2023 11:15 (30 minutes)

We study the proposal that the ratio of Psi(2s) and J/Psi exclusive photoproduction cross-sections might serve as an indicator of the presence of non-linear QCD evolution, related to the presence of high and potentially saturated gluon densities in both the proton and a lead nucleus. Our study employs recent fits of the GBW and BGK dipole model and provides predictions for both exclusive photoproduction on a proton and on a lead nucleus. While the cross-sections for photoproduction on a proton depend only weakly on non-linear low x corrections, we find an increased sensitivity for the cross-section ratio, which is directly related to the node in the Psi(2s) wave function. We further give a description of recent ALICE data for exclusive J/Psi photoproduction on a lead nucleus and provide predictions for Psi(2s) photoproduction on a lead nucleus as well as for the corresponding cross-section ratio.
