

UPC 2023: International workshop on the physics of Ultra Peripheral Collisions

Contribution ID: 25

Type: **not specified**

Measurement of dilepton production from photon fusion processes in UPC in Pb+Pb collisions with the ATLAS detector

Tuesday 12 December 2023 16:30 (30 minutes)

Relativistic heavy-ion beams at the LHC are accompanied by a large flux of equivalent photons, leading to multiple photon-induced processes. This talk presents a series of measurements of dilepton production from photon fusion performed by the ATLAS Collaboration. Recent measurements of exclusive dielectron production in ultra-peripheral collisions (UPC) are presented. These processes provide strong constraints on the nuclear photon flux and its dependence on the impact parameter and photon energy. Comparisons of the measured cross-sections to QED predictions from the Starlight and SuperChic models are also presented. Tau-pair production measurements can constrain the tau lepton's anomalous magnetic dipole moment ($g-2$), and a recent ATLAS measurement using muonic decays of tau leptons in association with electrons and tracks provides one of the most stringent limits available to date.

Presenter: GRABOWSKA-BOLD, Iwona (AGH University of Krakow (PL))

Session Classification: Two-photon interactions

Track Classification: Session 2: Two-photon physics
