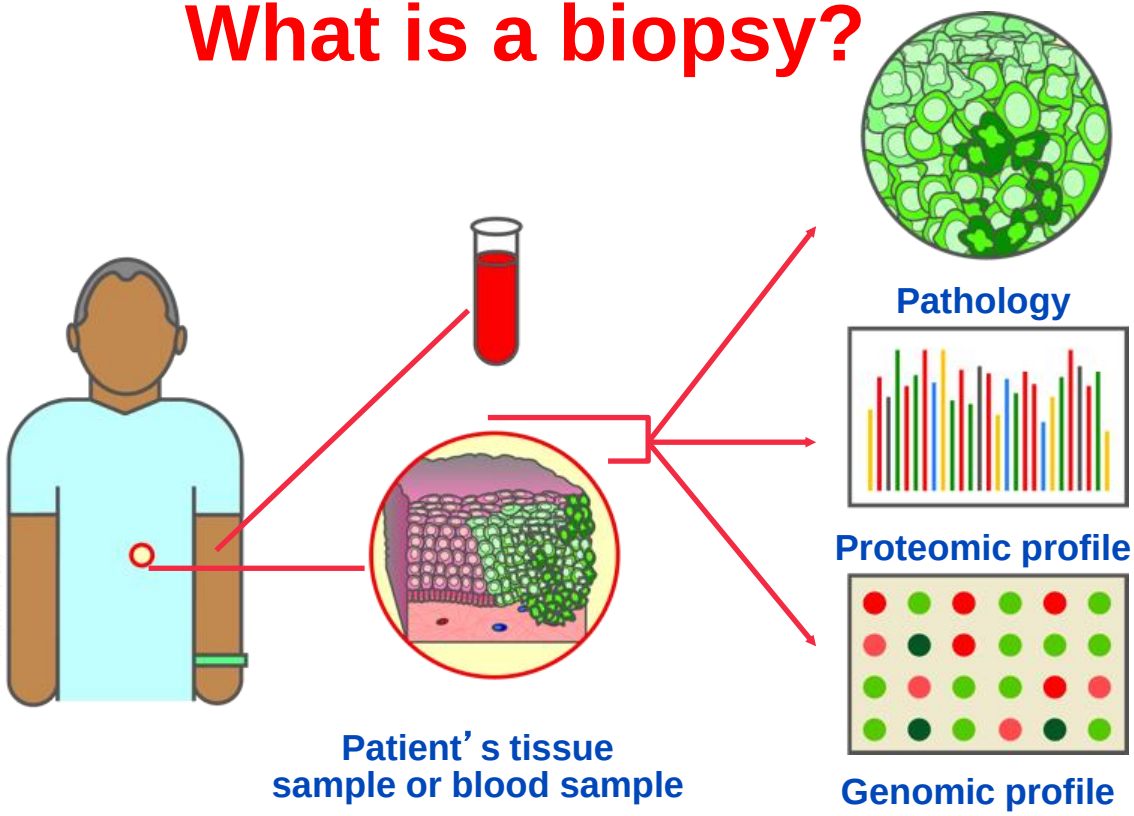
How to Treat Cancer ....
With minimal side-effects

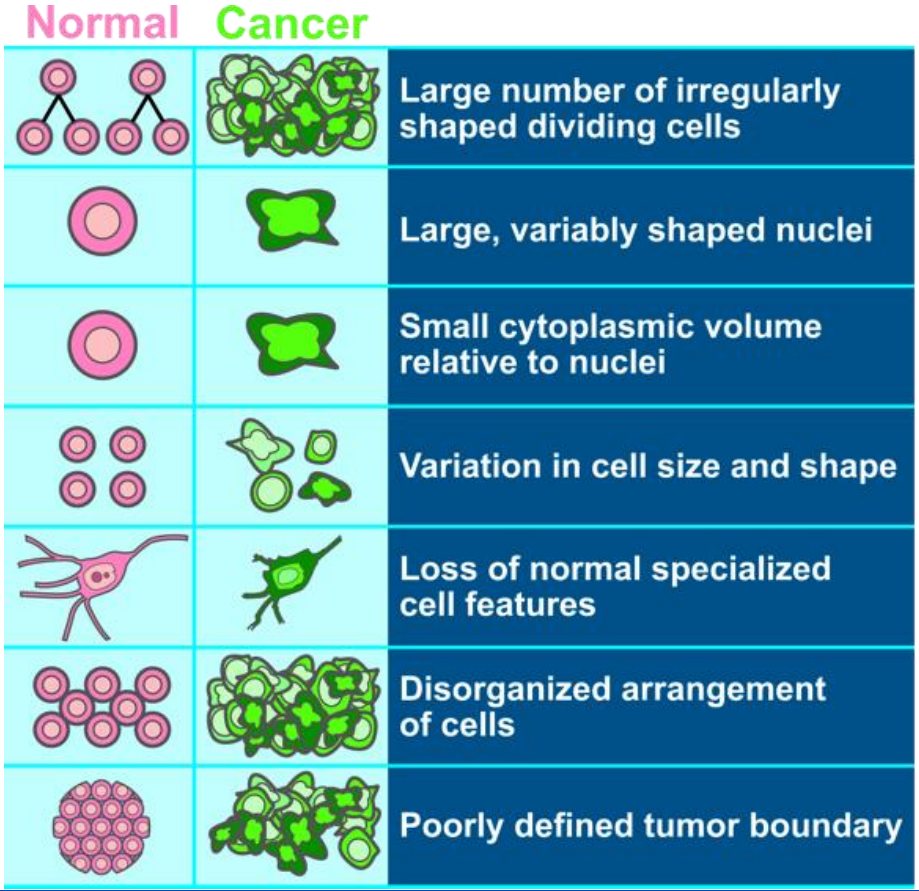
- Holy grail of oncology
- Identify characteristics that distinguish tumor cells from normal cells
- Design a Monotherapy that selectively ablates tumor cells

Let‘s start with Biology …

What is a biopsy?

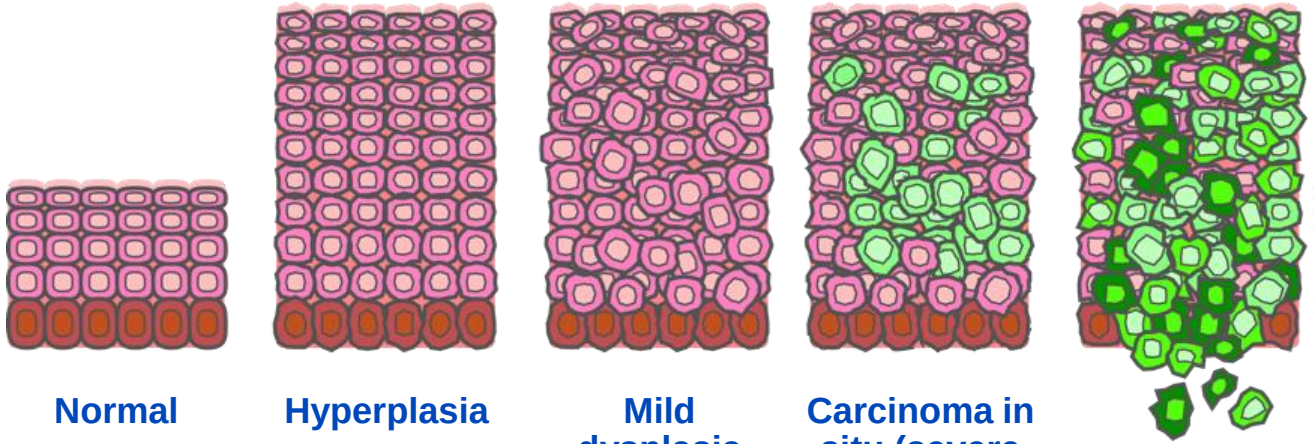


What does a pathologist look for in biopsy tissue?



Some more Biology…

How does Cancer look like under the microscope?



Normal

Hyperplasia

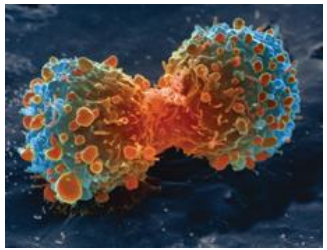
Mild dysplasia

Carcinoma in situ (severe dysplasia)

Cancer (invasive)

What is Cancer ?

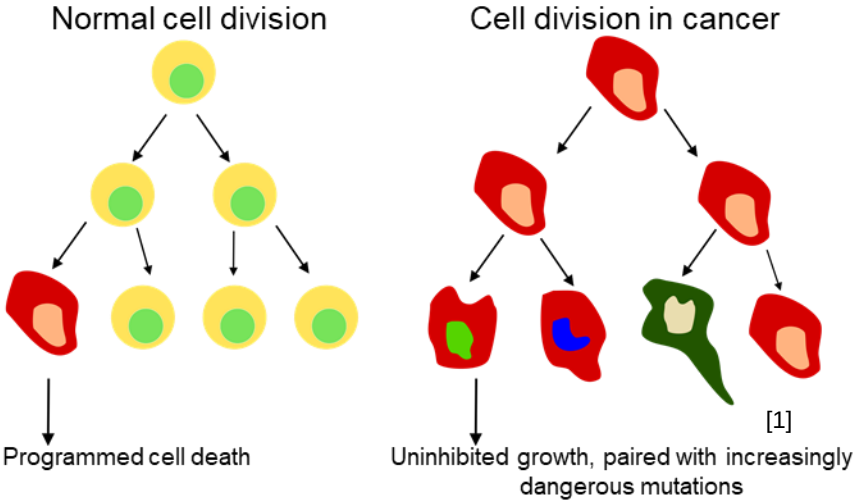
- is uncontrolled cell proliferation and cell rampant growth
- cancer may spread to other parts of the body
- over 100 different types, individual



Cancer cell of a lung tumor during cell proliferation

[2]

healthy cells vs. cancer cells



[1]

Theory of cancer formation:

(random) mutation levers out i.a. programmed cell death
→ cells need to be removed / killed “manually” for treatment

[1] Garak76, Suhadi Jorhaa'ir (https://commons.wikimedia.org/wiki/File:Zellteilung_normal_im_Gegensatz_zu_Krebs.svg), „Zellteilung normal im Gegensatz zu Krebs“

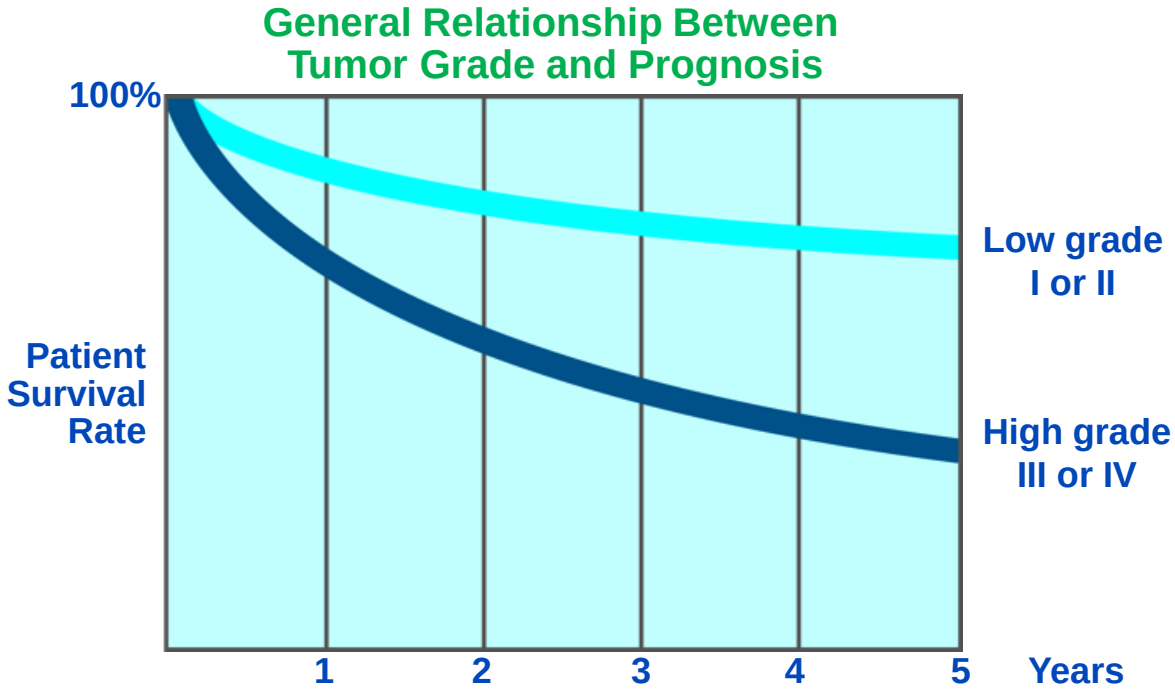
What is the relationship between tumor grade and patient survival?



Cancer - incidence

Hallmark of Cancer

“Warburg Effect”

Adequate oxygen

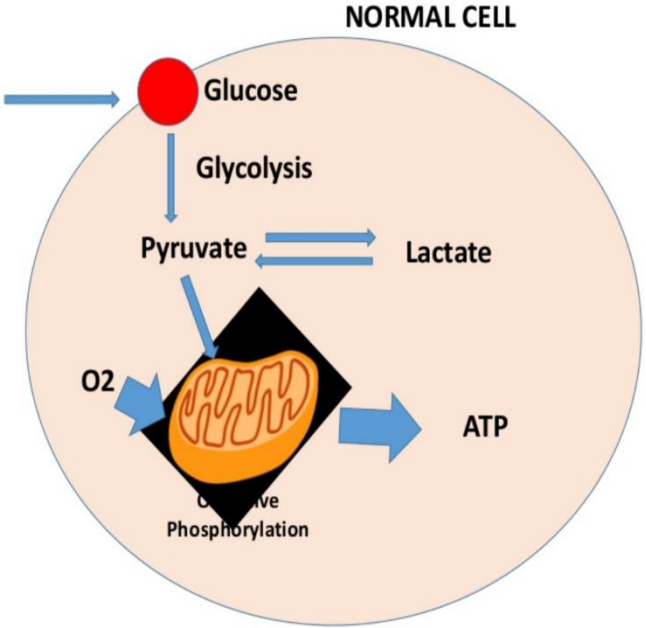
ATP is generated by Oxidative Phosphoryation

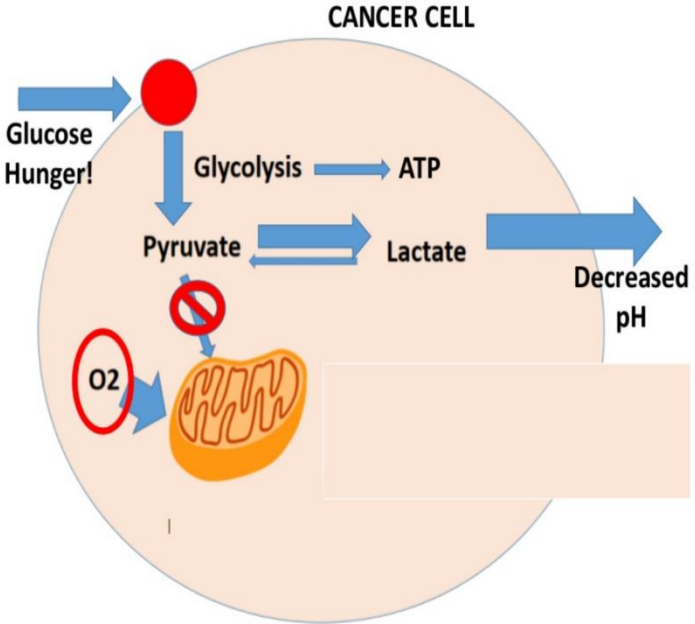
As Oxygen Decreases

Shift from Oxidative phosphorylation to **Glycolysis**

Anaerobic glycolysis

PASTEUR EFFECT





Early 20th Century

Otto Heinrich Warburg
German Physiologist

Observed that cancer cells had increased rates of glycolysis

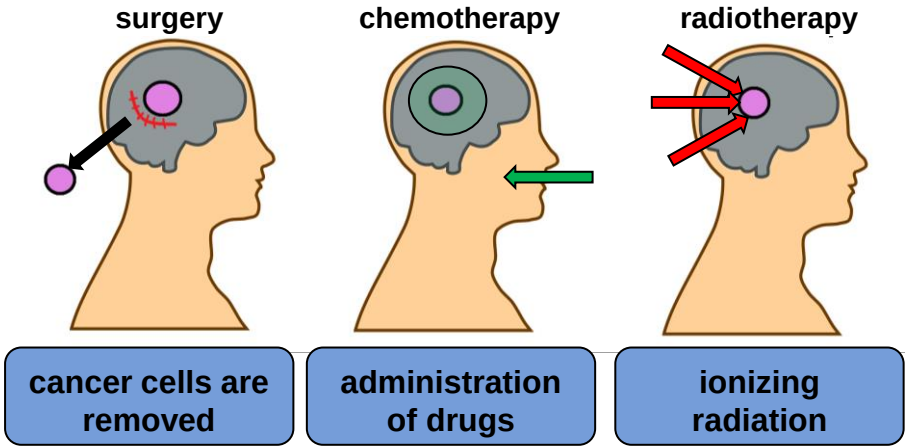
Despite the availability of adequate oxygen levels

Aerobic glycolysis

WARBURG EFFECT

Why do cancer cells activate glycolysis despite the presence of oxygen?

Treatment options



Goal:

1. CURE leads survival
2. PALLIATIVE leads better quality of life

Chances of survival:

60% of all cancer patients survive more than **5** years [1]

- **10**-year prognosis **<1%** pancreatic cancer
- **10**-year prognosis **~84%** prostate cancer

External radiotherapy

Internal radiotherapy

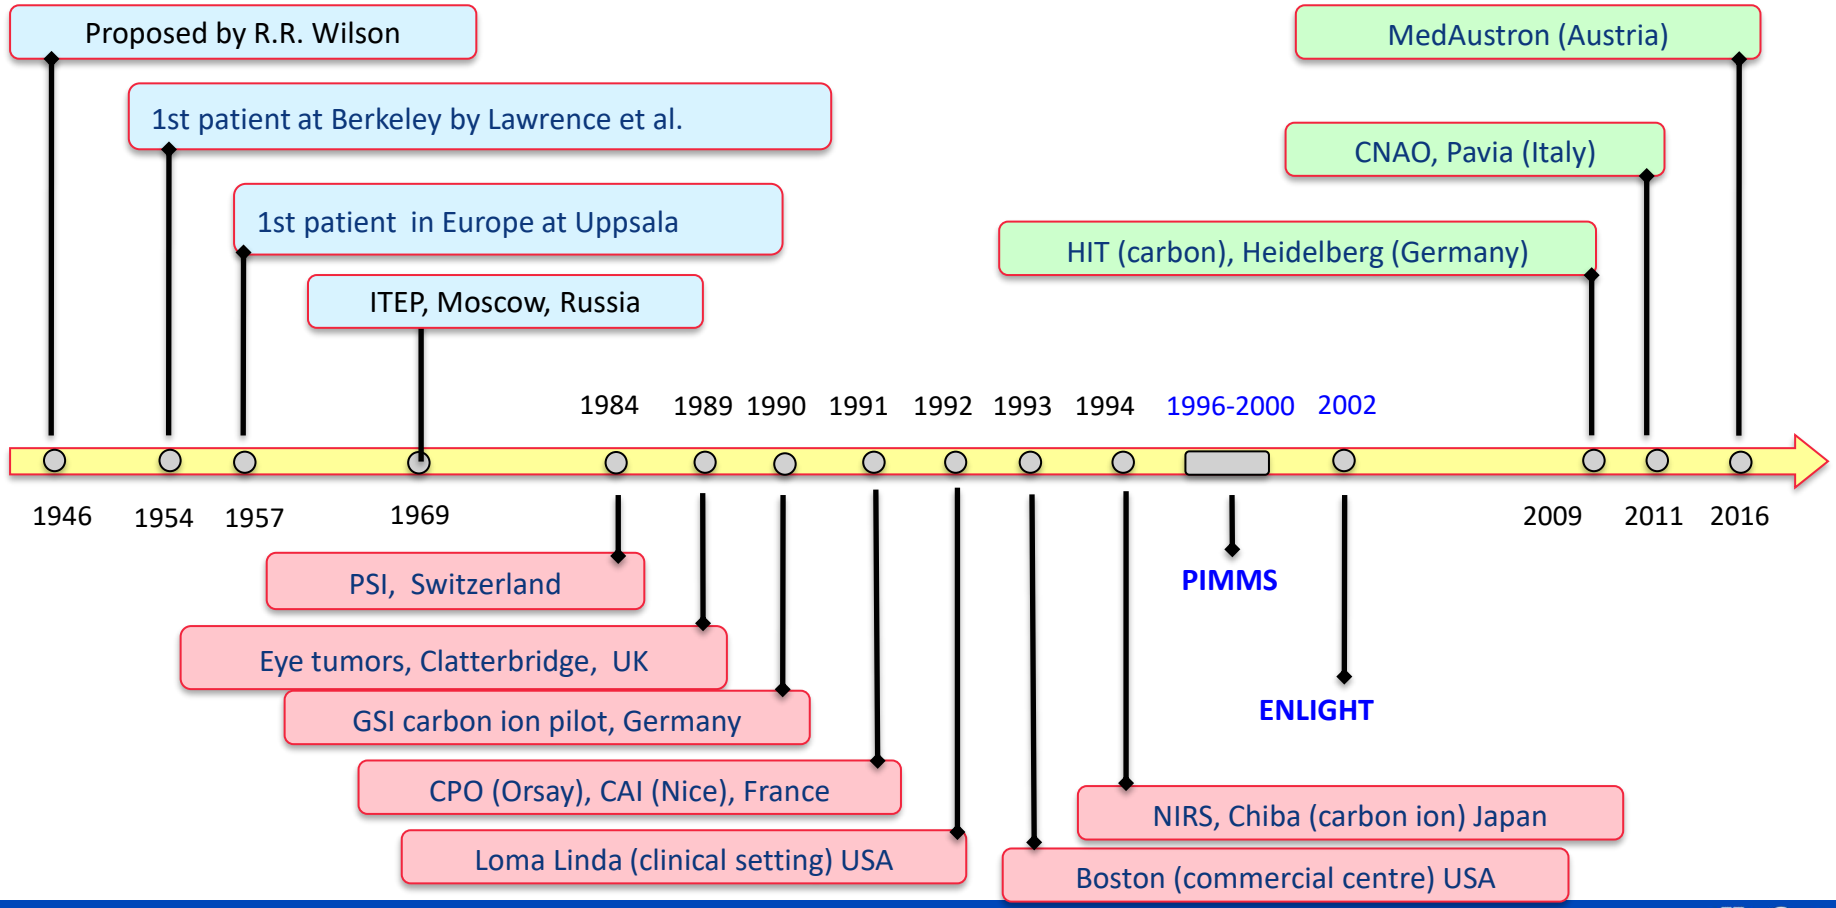
electromagnetic radiation

particle radiation

brachytherapy

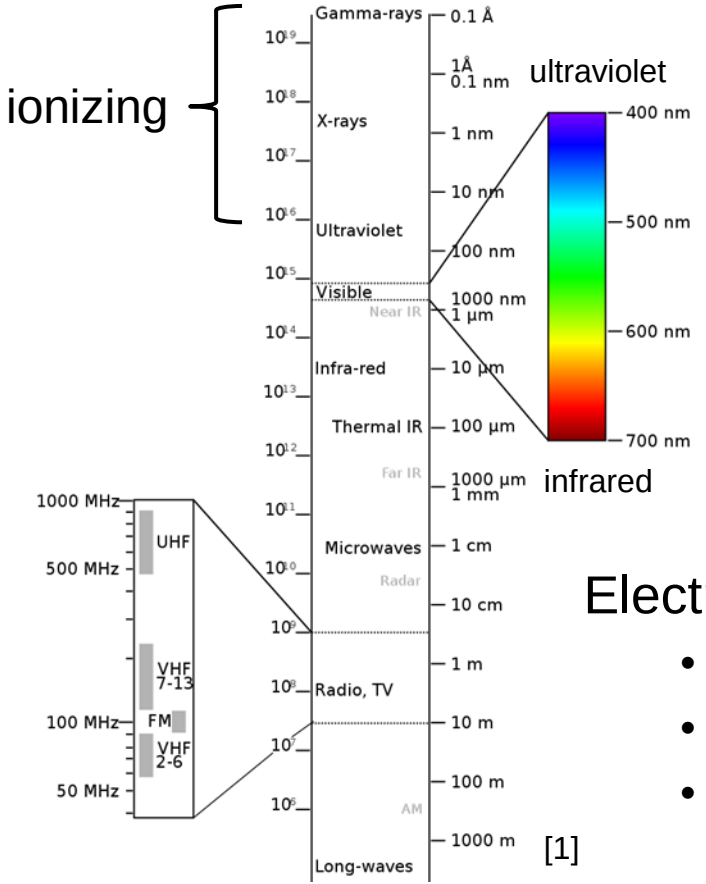
[1] A joint publication of the Robert Koch Institute and the German Cancer Associations (Gesellschaft der epidemiologischen Krebsregister in Deutschland e. V.), 11th issue, 2017, accessed on 20.11.2018

History of particle therapy



Radiation
From Small amounts
to
Large Amounts

Natural radiation



Spectrum visible to the human eye (light)

[1]

Electromagnetic radiation - **Photons**

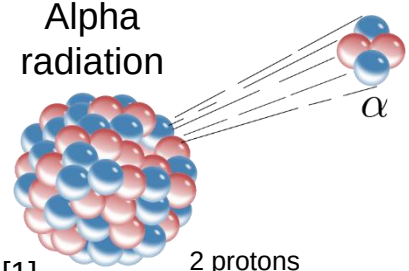
- Gamma rays
- X-rays
- But also: radio, light, microwaves, etc.

[1] !Original: PenubagVector: Victor Blacus (https://commons.wikimedia.org/wiki/File:Electromagnetic-Spectrum.svg), „Electromagnetic-Spectrum“, https://creativecommons.org/licenses/by-sa/3.0/legalcode

Natural radiation

- Particle radiation
  - Alpha radiation – helium nuclei
  - Beta radiation – electrons/positrons
  - Other nuclei/ions (e.g. cosmic radiation)

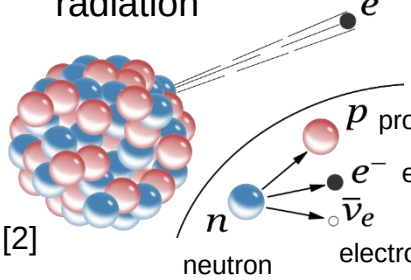
Alpha radiation



[1]

2 protons
+
2 neutrons

Beta radiation β^-



[2]

neutron

electron neutrino

Types of radioactive decay

Type	Nuclear equation	Representation	Change in mass/atomic numbers
Alpha decay	${}^{A}_{Z}X \rightarrow {}^{4}_{2}He + {}^{A-4}_{Z-2}Y$		A: decrease by 4 Z: decrease by 2
Beta decay	${}^{A}_{Z}X \rightarrow {}^{0}_{-1}e + {}^{A}_{Z+1}Y$		A: unchanged Z: increase by 1
Gamma decay	${}^{A}_{Z}X \rightarrow {}^{0}_{0}\gamma + {}^{A}_{Z}Y$		A: unchanged Z: unchanged
Positron emission	${}^{A}_{Z}X \rightarrow {}^{0}_{+1}e + {}^{A}_{Y-1}Y$		A: unchanged Z: decrease by 1
Electron capture	${}^{A}_{Z}X \rightarrow {}^{0}_{-1}e + {}^{A}_{Y-1}Y$		A: unchanged Z: decrease by 1

Radiation exposure in everyday life

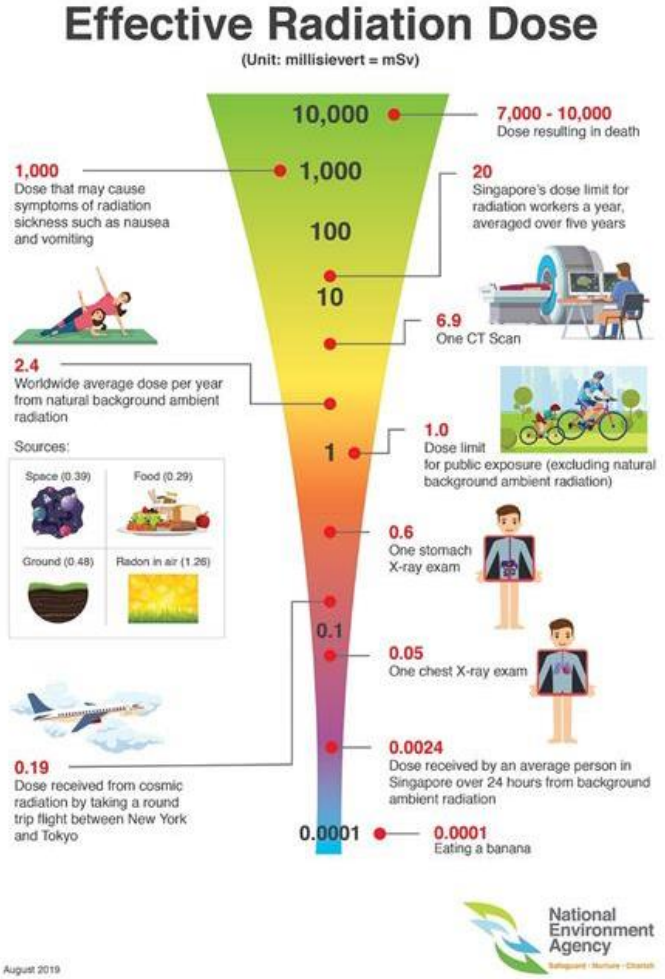
- Generally known: body dose

- given and measured in Sievert
- considers the sensitivity of the respective organ and radiation type
- cosmic and terrestrial radiation
- medical and technical applications
- diverse loads (e.g. flight travels)

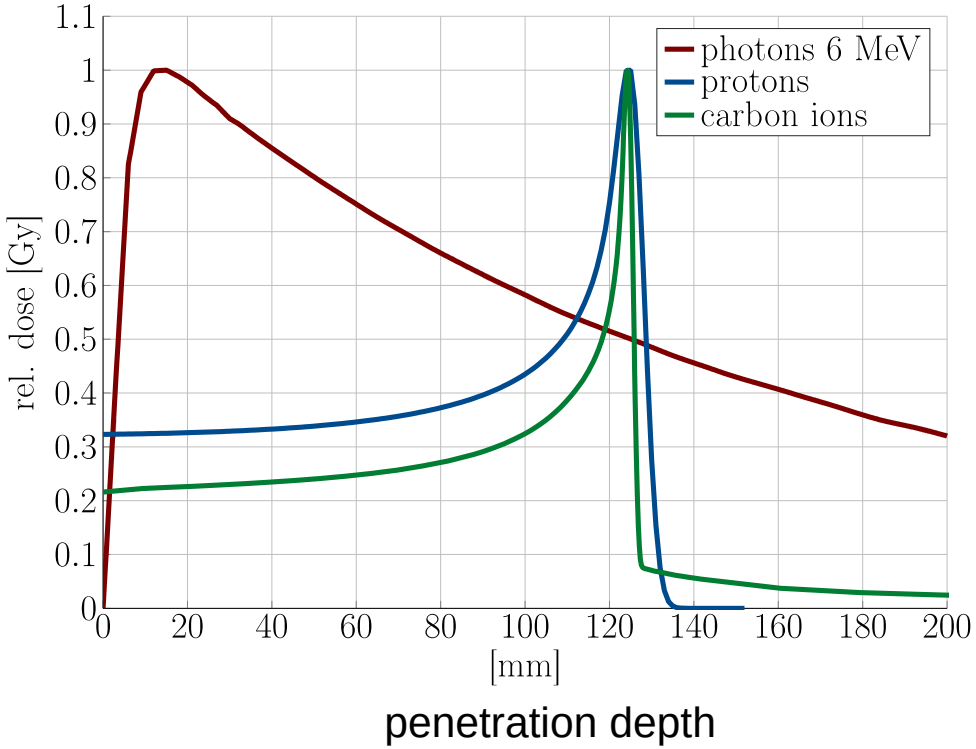
Banana equivalent dose:

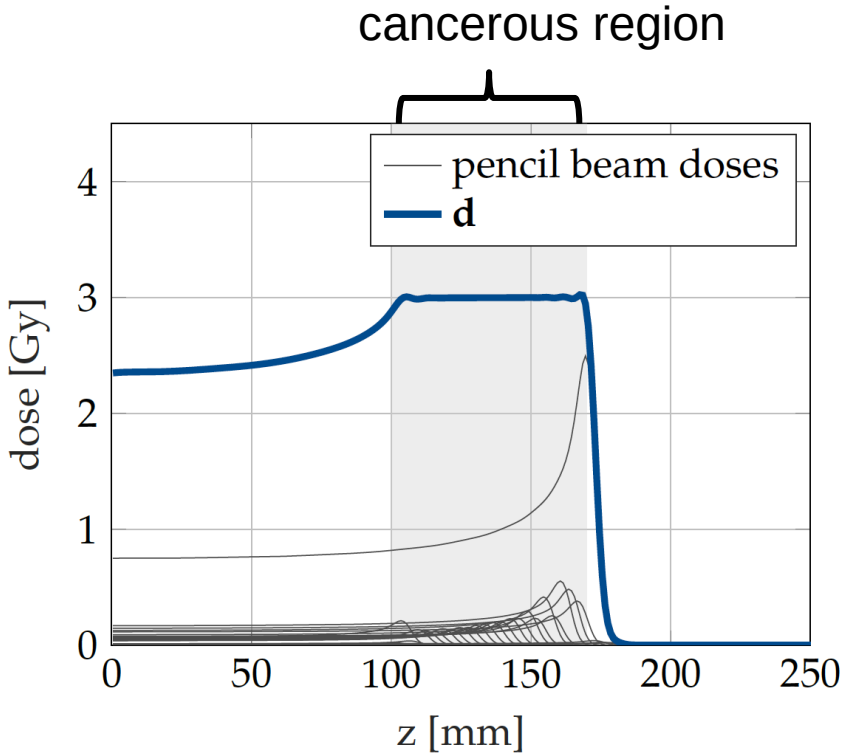
0.4 gram potassium consists to
0.01% of the radioactive potassium isotope K-40
1000 bananas in 8 hours → 0.1 mSv

Average dose: 4 mSv per year



Why bother with particle therapy?

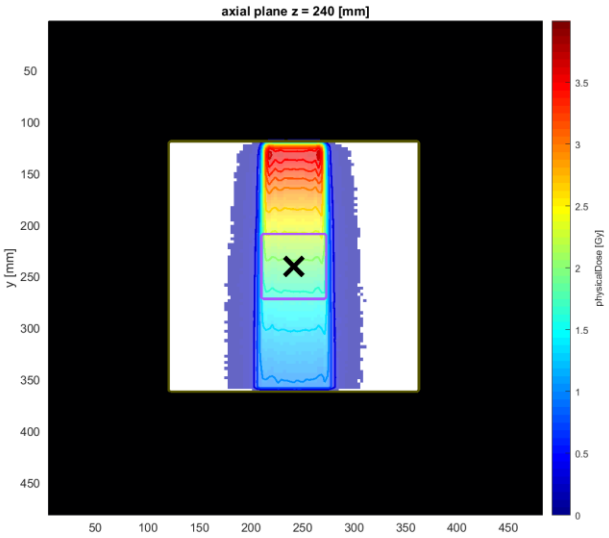




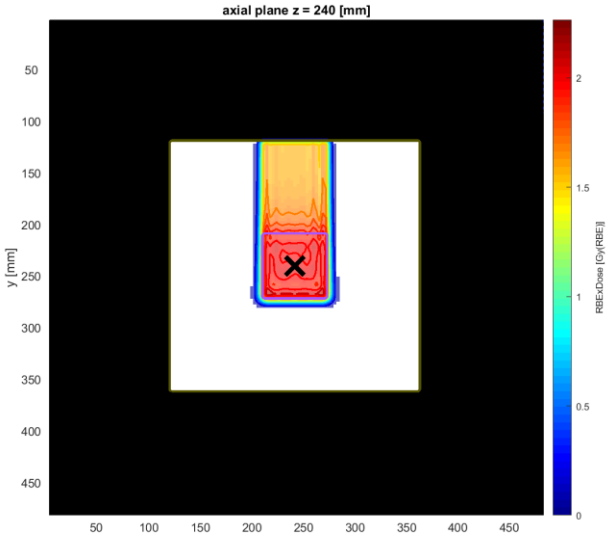
Why bother with particle therapy?

- We always risk damaging healthy tissue “on the way”...

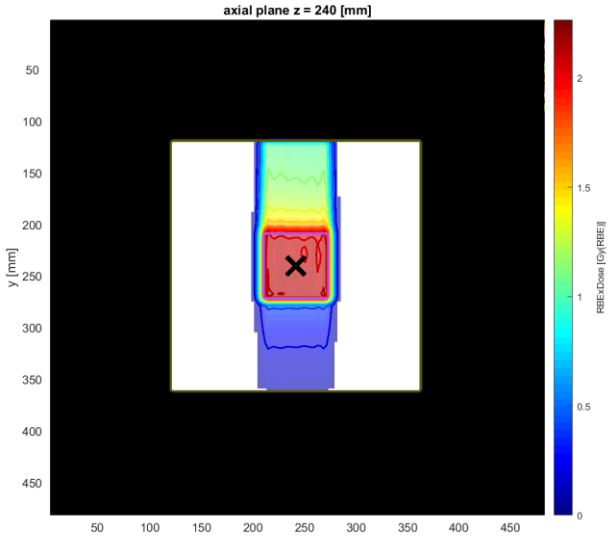
photons



protons



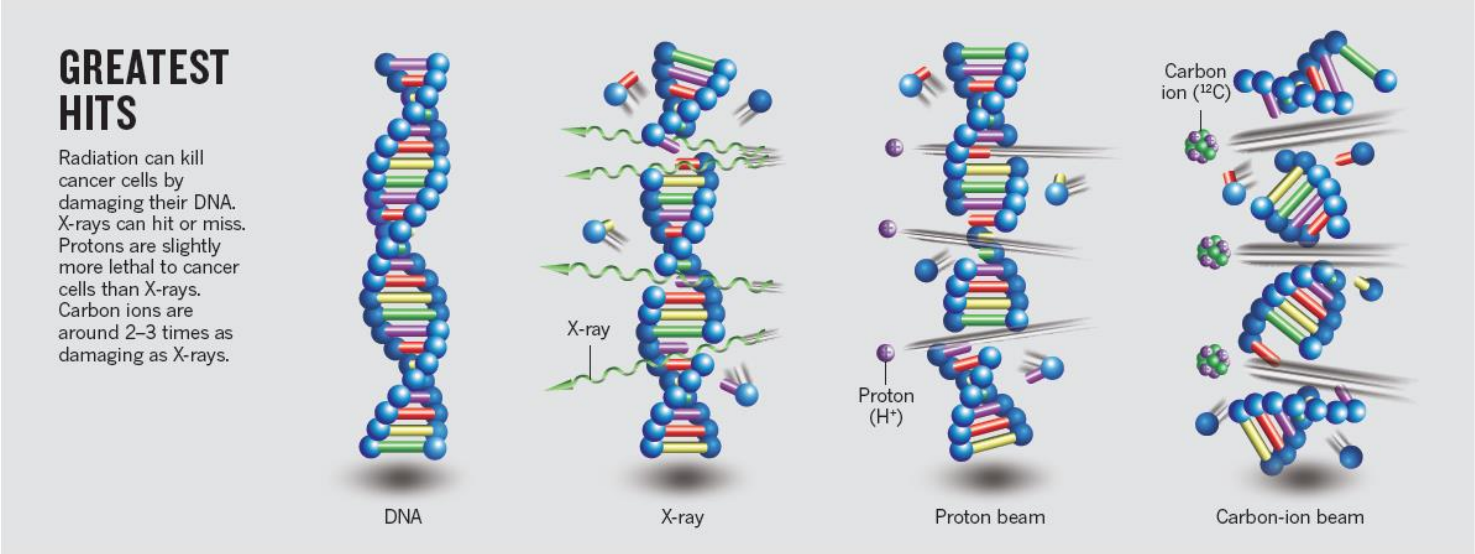
carbon ions



.... but it looks quite good for a particle beam ☺

Why bother with carbon ions?

photons protons carbon ions



[1]

- Energy release is **localized** to a varying extent. ^{12}C is 12 times heavier than p^+
- Heavy ions generate locally more severe damage → more difficult to repair

[1] Marx, V. (2014, April 4). Sharp shooters. 508. Nature, p. 137.

Summary

- cancer diseases are characterized by uncontrolled growth of mutated cells
- radiation transfers energy to the tissue in form of elementary physical interactions → radiation dose
- energy release ionizes the tissue
  - → breaks down chemical bounds or forms new ones
  - → DNA damage
  - → cell death
- by artificially generating radiation, we can combat cancer cells in a targeted manner
- not without risk for the healthy tissue

  → but high conformity when applying particle beams

- **Questions?**

Cancer - incidence

Cancer incidence worldwide

14 million new cases of cancer in **2012** [1]

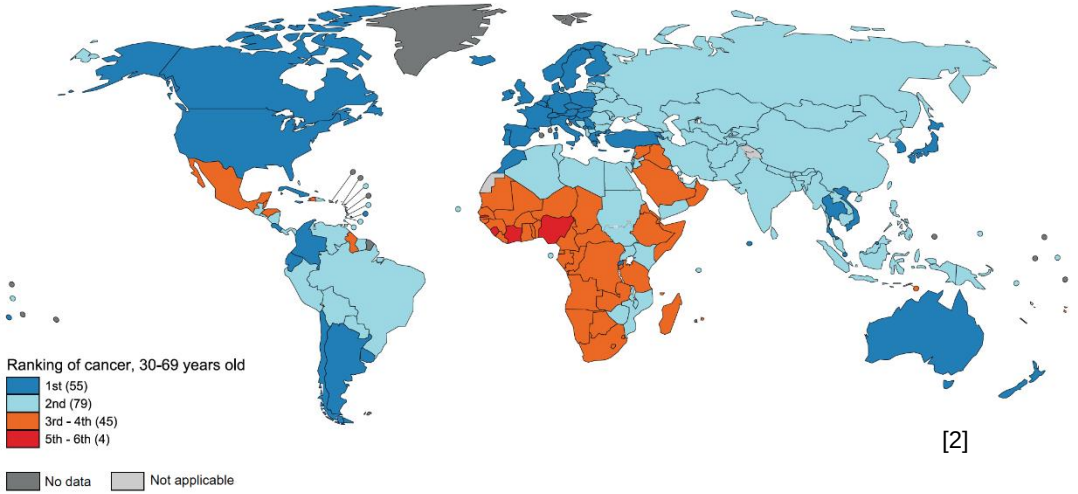
8 million deaths due to cancer in **2012** [1]

19 million new cases of cancer in **2020** [2]

10 million deaths due to cancer in **2020** [2]

2.3 million deaths **linked to corona**

28.4 million new cases of cancer in **2040** [2]
How many deaths in 2040?



[2]

Dark blue: Cancer is the leading cause of premature death

Cancer incidence national

- **500 000** new cases of cancer in Germany every year [3,4], 2.5 times the population of Mainz
- rising tendency due, among other things, to demographic developments
