

Overview of Key4HEP interfaces to generators

ECFA Higgs Factories: 2nd Topical Meeting on Generators

June 21, 2023
G Ganis, CERN-EP

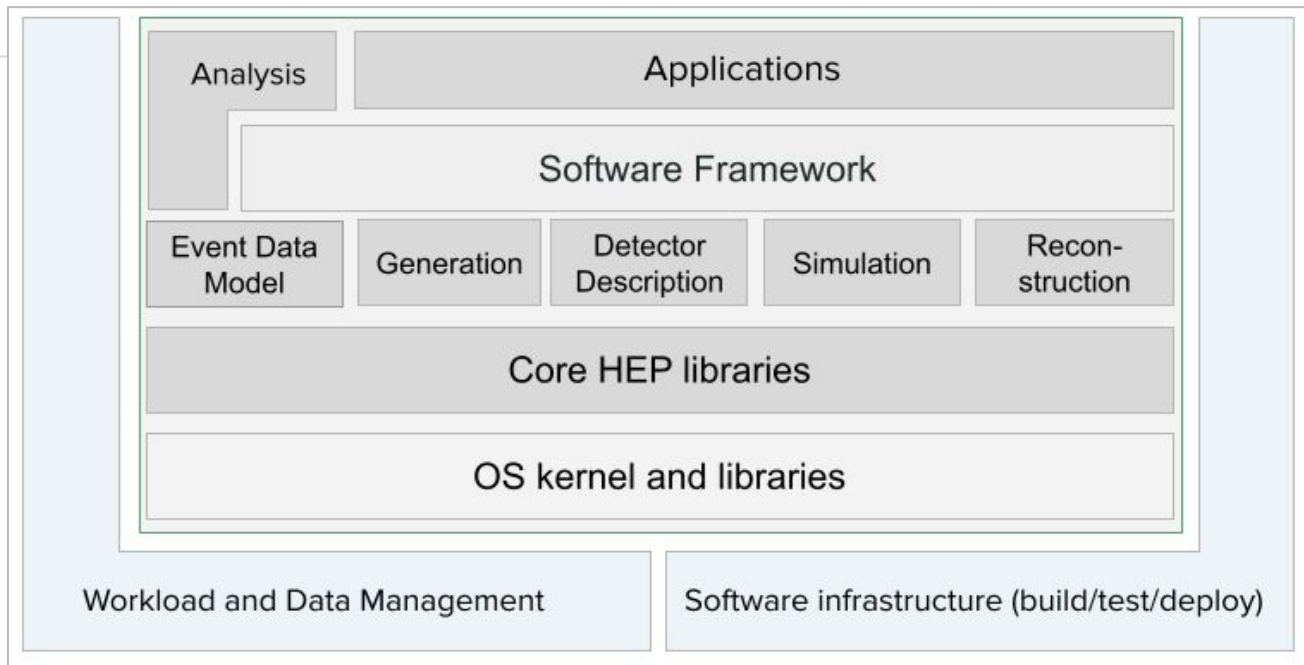

Outline

- Key4HEP reminder
- Monte Carlo generators @ key4HEP
 - Interoperability levels and managements
 - Data formats
 - Role and current status of k4Gen
- Summary

HEP Software Ecosystem

See [G Ganis @ ECFA Kick-off, June 2021](#)

Seamless integration and optimization between various networks of devices, software and services aimed to facilitate data processing for High Energy Physics experiments

Key4HEP: Turnkey Software Stack

Structured software stack integrating in optimal way various software components to provide a ready-to-use full-fledged solution for data processing of HEP experiments

Complete set of tools for

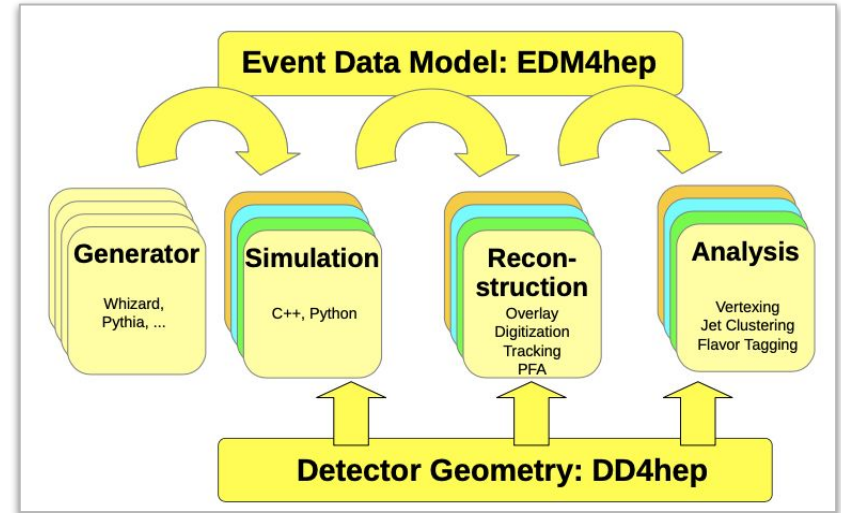

- Generation, simulation, reconstruction, analysis
- Build, package, test, deploy, run

Main Ingredients

- Event Data Model (PoDIO/**EDM4hep**), used also for **persistency**, processing framework (**Gaudi**), geometry information (**DD4hep**), Package manager (**Spack**)

Community project, unifying efforts

- Contributions from CLIC, ILC, FCC, CEPC, EIC, MuonCol
- Support from major R&D programs

Kick-off meetings in [Bologna](#), [Hong Kong](#)

Key4HEP status and adoption

- Fully adopted by FCC
 - Building block of the feasibility study
 - Used also for FCC-hh studies
- Increasing adoption by CLIC, ILC, CEPC
- Interest by other projects (C3) and beyond the initial e+e- collider communities

[Recent CHEP 2023 presentation](#)

Where can key4hep be found?

- Key4hep is available on the **CernVM-FS shared distributed file system**

```
$ source /cvmfs/sw.hsf.org/key4hep/setup.sh
Setting up the latest Key4HEP software stack from CVMFS ...
$ which KKMCEe
/cvmfs/sw.hsf.org/spackages7/kkmcee/5.00.02/x86_64-centos7-gcc11.2.0-opt/vfxk/bin/KKMCEe
$ which mg5
/cvmfs/sw.hsf.org/spackages7/madgraph5amc/2.8.1/x86_64-centos7-gcc11.2.0-opt/nlauf/bin/mg5
$ pythia8-config --libdir
/cvmfs/sw.hsf.org/spackages7/pythia8/8.306/x86_64-centos7-gcc11.2.0-opt/dhhih/lib
```

- **CernVM-FS optimizes remote access**
 - LHC driven solution adopted widely
 - Available for any unix-like system
 - Requires internet connection (but solutions to work off-line available)

Monte Carlo generators @ key4hep

Monte Carlo Generators in key4hep

- A Monte Carlo generator is a **package**
- Key4hep includes already many generators as packages
 - Initial list derived from **LCG stacks**, so sort of LHC oriented
 - But several e+e- additions available: Whizard, KKMCEE, BabaYaga, BHLUMI, ...
 - Including wrappers for better user experience
- What does it mean “adding a generator to key4hep”?
 - Required information for inclusion in the package manager
 - **Source** location, minimal **documentation on how to build and** required **dependencies**, default configuration files, tests, ...
 - Key4hep infrastructure will
 - Build in **shared installation** mode
 - Run built-in tests, if any
 - Install in **distributed shared file system**

List of generators currently available in key4hep

T Mandlener, Oct 2022

- Generators

<code>babayaga[†]</code>	<code>baurmc[†]</code>	<code>bhlumi[†]</code>	<code>crmc[†]</code>	<code>evtgen</code>	<code>genie[†]</code>
<code>gosam[†]</code>	<code>guinea-pig[†]</code>	<code>herwig3</code>	<code>herwigpp[†]</code>	<code>kkmcee*</code>	<code>madgraph5amc</code>
<code>photos</code>	<code>pythia6[†]</code>	<code>pythia8</code>	<code>sherpa</code>	<code>starlight[†]</code>	<code>superchic[†]</code>
<code>tauola[†]</code>	<code>vbfnlo</code>	<code>whizard</code>			

- “Generator tools”

<code>agile[†]</code>	<code>alpgen[†]</code>	<code>ampt[†]</code>	<code>apfel[†]</code>	<code>ccs-qcd[†]</code>	<code>chaplin[†]</code>
<code>collier[†]</code>	<code>cuba[†]</code>	<code>dire[†]</code>	<code>feynhiggs[†]</code>	<code>form[†]</code>	<code>hepmc</code>
<code>hepmc3</code>	<code>heppdt</code>	<code>hoppet[†]</code>	<code>hztool[†]</code>	<code>lhapdf</code>	<code>lhapdfsets[†]</code>
<code>looptools</code>	<code>openloops</code>	<code>professor[†]</code>	<code>prophecy4f[†]</code>	<code>qd[†]</code>	<code>qgraf[†]</code>
<code>recola[†]</code>	<code>rivet</code>	<code>syscalc[†]</code>	<code>thepeg</code>	<code>unigen[†]</code>	<code>yoda</code>

The availability of the latest version depends on requests from community

Levels of interoperability

- Level 0 - *Common Data Formats*
 - Maximal interoperability, even on different hardware
- Level 1 - *Callable Interfaces*
 - Defined for one or more programming languages
 - Implementation quality of interfaced components important
 - Required to define plugins
- Level 2 - *Introspection Capabilities*
 - Software elements to facilitate the interaction of objects in a generic manner such as Dictionaries and Scripting interfaces
 - Language bindings, e.g. PyROOT
- Level 3 - *Component Level*
 - Software components are part of a *common framework*, optimal interplay
 - Common configuration, log and error reporting, plug-in management, ...

Managing interoperability through Gaudi

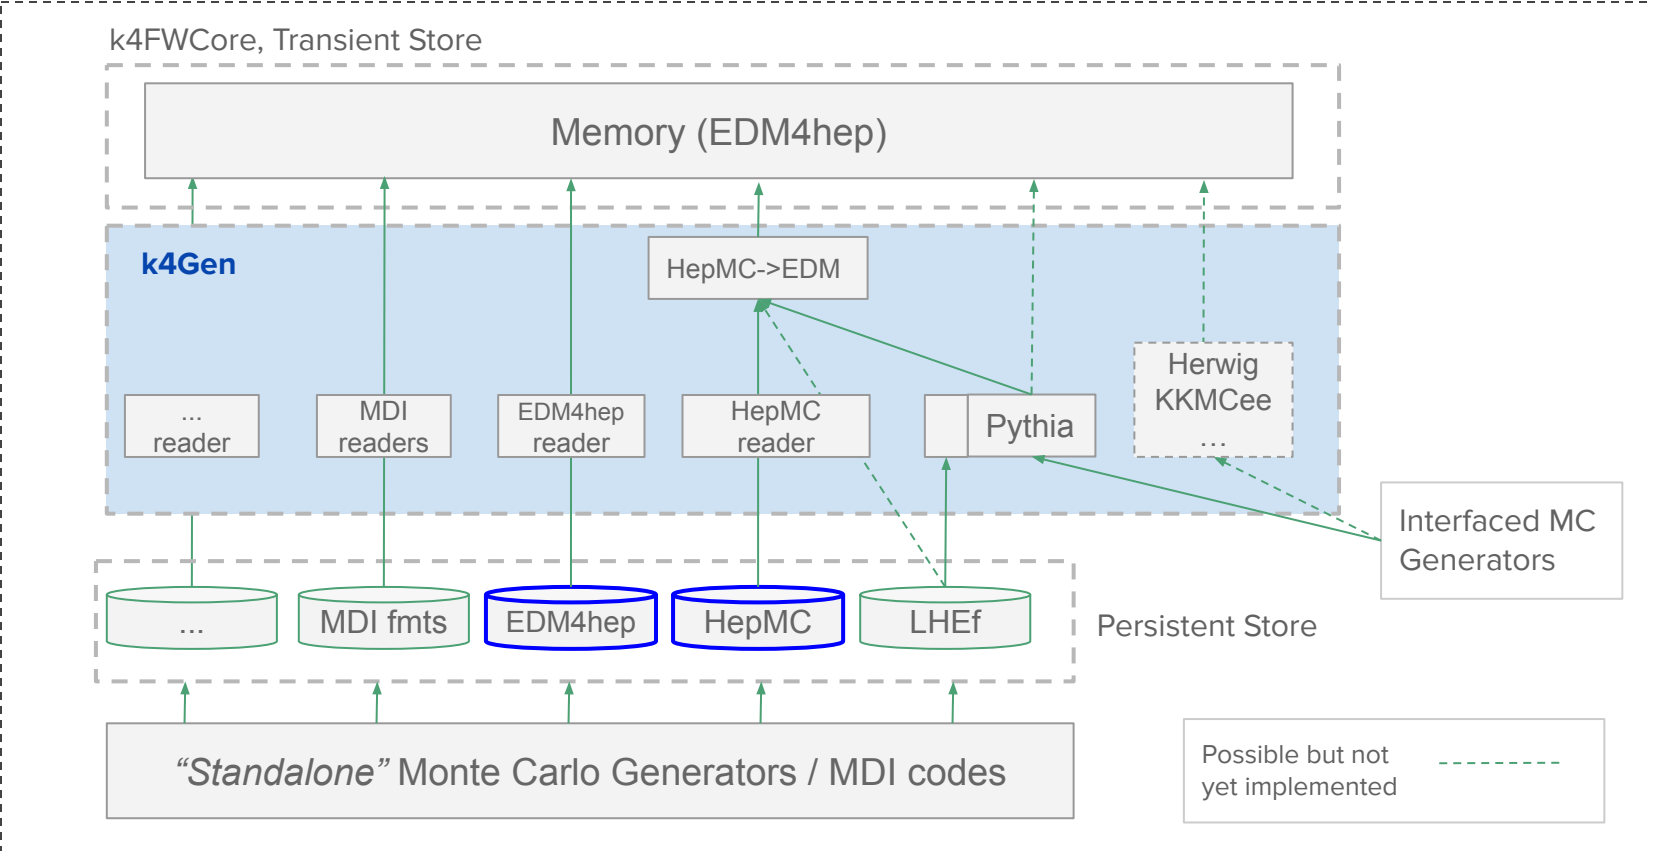

- Components tailored for specific tasks
 - Tools for inputting and managing MC outputs
 - Derived from LHCb approach
- What is required
 - Readers for data formats
 - Currently available: HepEVT, HepMC, LHEf, ...
 - Level-1 interfaces for MC
 - Only currently available Pythia8; KKMCee5 under prototyping
 - Place where to put an interface to Herwig

About data formats

- EDM4hep
 - Baseline event data model
 - Default format managed by the DataSvc in k4FWCore
- HEPMC
 - Generic framework for MC generator event record encoding and manipulation
 - Very popular among MC authors
 - Version 3 provides also several interfaces to other formats
- HepEVT, StdHEP
 - Formats used by old FORTRAN generators
- LHEf
 - Designed for MC internals (matrix elements, ...), not for final states
 - Should be left for internal use of authors

Discussion at
1st ECFA generator
workshop

Managing interoperability in Gaudi

Technical follow up of 1st ECFA Gen Workshop

- Have a small number of well defined I/O output(s)
 - Efficient(s) and compressed
 - Baseline: EDM4hep@{ROOT, SLCIO}, HEPMCv3@ROOT (common among MCs)
 - Possibly provide / contribute additional converters to HepMC, e.g. EDM4hep
- Boundary generators / key4hep
 - Baseline: generators provide fully hadronized events
 - In particular, dedicated decayers, hadronizers, should be run before, i.e, by the generator
 - Key4hep starts from the generator output
 - list of final state particles (typically including incoming and intermediate)
 - HEPMC3 / EDM4hep formats preferably
 - Modules providing a direct MC to EDM4hep interface can still be accommodated
 - E.g. PythiaInterface, HerwigInterface, ...
 - Possibly under the responsibility of the authors (to be discussed)

k4Gen functionality

The repository is [k4Gen](#), and includes also modules to perform actions on the MC events

- *Event readers, converters:* HepMC, HepMCv2, HepEVT, MDI, HepMC->EDM4hep->HepMC
- *Generator interfaces:* Pythia, KKMCee (coming)
- *Filters:* Generated particles status, Decays hooks
- *Pileup tools:* Const, Range, Poisson
- *Particle guns:* Momentum range, const Pt
- *Vertex smearing:* Flat, Gauss
- ...

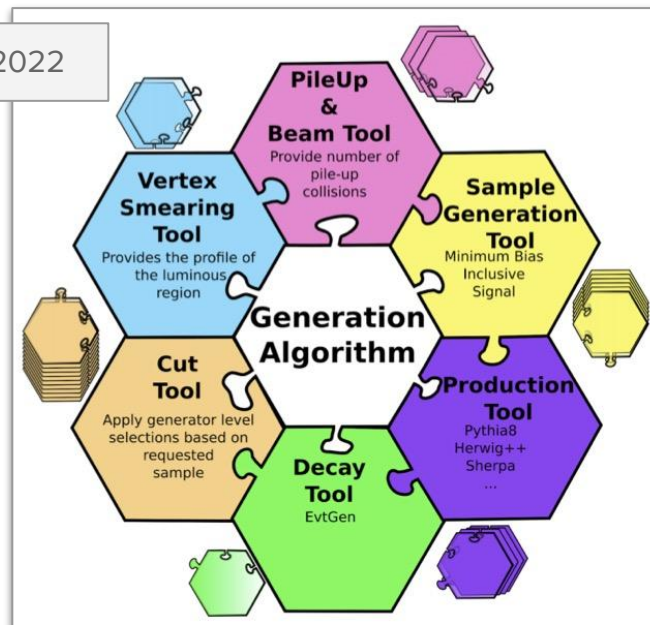

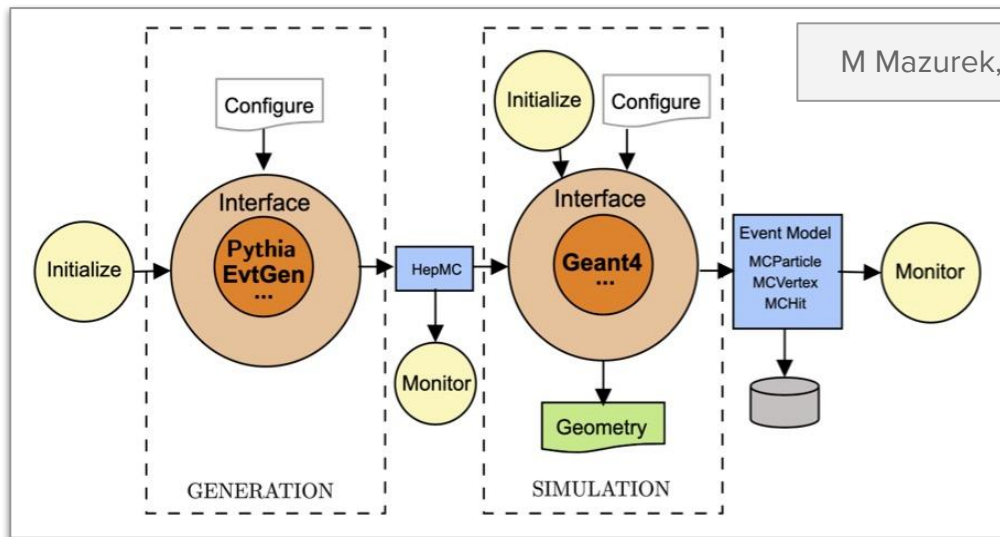

Some considerations

- Complexity of interaction regions and beam conditions might require “more” from the generation phase
- For example, in FCC
 - Crossing-angle
 - Beam Energy Spread
 - Vertex spread
 - Beam-beam effects
 - ...
- Some of these can be approximately factorised out and accounted for in a common way for all generators
- But the ultimate treatment should come from a proper treatment inside generators, possibly w/ common technology

Gaussino: improving gen / sim Gaudi interfaces

Gaussino
[Doc](#), [GitLab](#)

- LHCb latest development in the field, in production in Run3
- Streamlines integration of generations and fast/full simulation in Gaudi
 - Evolution of current Key4HEP approach improving on multi-threading and reproducibility

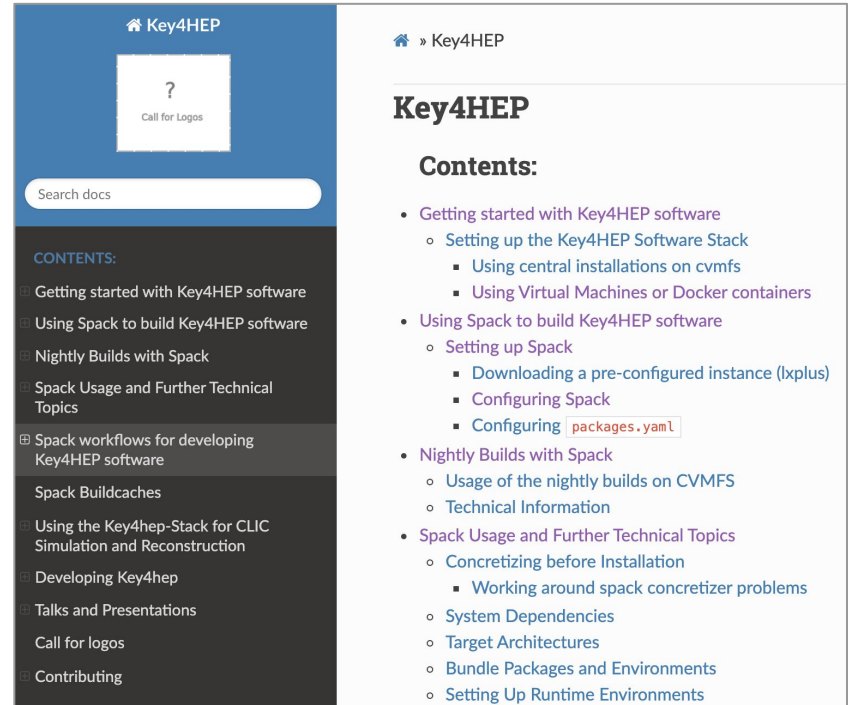

- Being imported in Key4hep

Summary

- Key4hep has acquired a prominent role in addressing the software needs of its immediate stakeholders, i.e. **EW/Higgs factories**
- Key4hep provides
 - A coherent software stack
 - Increasingly complete and centrally distributed
 - A sanitized environment, w/ internal consistency tests
 - Version tracking
- For MC Generators, a 2-level interoperability interface is provided
 - Matching current needs of projects
 - But ready to be adapted to evolving needs, exploiting the flexibility of the underlying framework

Useful links

- Key4hep GitHub Project
<https://github.com/key4hep>
- Main documentation page
<https://key4hep.github.io/key4hep-doc/>
- Doxygen available., e.g. for EDM4hep
