# CERN

**“Science without borders”**

Established in 1954, CERN has become a prime example of international collaboration with a mission to:

- ❖ perform world-class research in fundamental physics.
- ❖ provide a unique range of particle accelerator facilities that enable research at the forefront of human knowledge, in an environmentally responsible and sustainable way.
- ❖ unite people from all over the world to push the frontiers of science and technology, for the benefit of all.
- ❖ train new generations of physicists, engineers and technicians, and engage all citizens in research and in the values of science.

At CERN, our work helps to uncover what the universe is made of and how it works.

## Study of Quark Gluon Plasma (QGP): - A journey to the beginning of the Universe

- Our Universe is thought to have been in a primordial state of extreme temperature and/or energy density for the first few millionths of a second after the Big Bang.
- The ALICE Collaboration has built a dedicated detector to study matter at extreme conditions by colliding heavy-ions (such as Pb on Pb) at the Large Hadron Collider.
- The properties of such a state provide key issues for Quantum Chromo Dynamics, the understanding of deconfined and chiral phase transitions.

# Heavy-ion collisions: Creating the Quark-Gluon Plasma

- Take a high-mass atom like Au or Pb
- Take away the electron => Ion (**Heavy-ion**)
- **Accelerate the Ion** to almost the speed of light
- **Collide the Ions => Create the Little Bang**
- Study the aftermath by specialized detector systems which surround the collision point => **Experiment**

# ALICE at Point-2 of the LHC

# Photon Spectra and QGP temperature

Phys. Lett. B 754 (2016) 235-248

- Photons do not interact via the nuclear force → transparent to the medium
- Photons are emitted in all stages and are unaffected by the medium.

## Core of the Sun:

(1eV=11605K)

$T_{eff} = 3,527,920$  million deg

**LARGEST EVER TEMPERATURE REACHED IN THE LAB ...**

# New Inner Tracking System (ITS)

- 7-layer geometry (23 – 400mm),  $|\eta| \leq 1.5$
- 10 m<sup>2</sup> active silicon area (**12.5 G-pixels**)
- Pixel pitch 28 x 28  $\mu\text{m}^2$
- Spatial resolution  $\sim 5\mu\text{m}$
- Power density < 40mW / cm<sup>2</sup>
- Material thickness:  $\sim 0.3\%$  / layer (IB)
- Maximum particle rate: 100 MHz / cm<sup>2</sup>

Based on CMOS Monolithic Active Pixel Sensors (MAPS)

ITS inner

10 m<sup>2</sup> active silicon area (**12.5 G-pixels**)

ITS outer

- In recent years, CMOS image pixel sensors have been widely used in digital cameras and smartphones. The ALICE ITS uses the same technology for detecting particles.
- In contrast to consumer applications, it is significantly larger: 10m<sup>2</sup> surface area (more than the sensors of 25000 cameras), and contains **12.5 billion pixels**, a thousand times more than most consumer devices.
- On top of it, it takes 50000 pictures a second.

The inner (left, middle) and outer (gold colour) barrels of ALICE's state-of-the-art **Inner Tracking system (ITS)** along with the new **Muon Forward Tracker (MFT)** (green panel).
