Let's just go ahead and look...The Sky in Gamma Rays

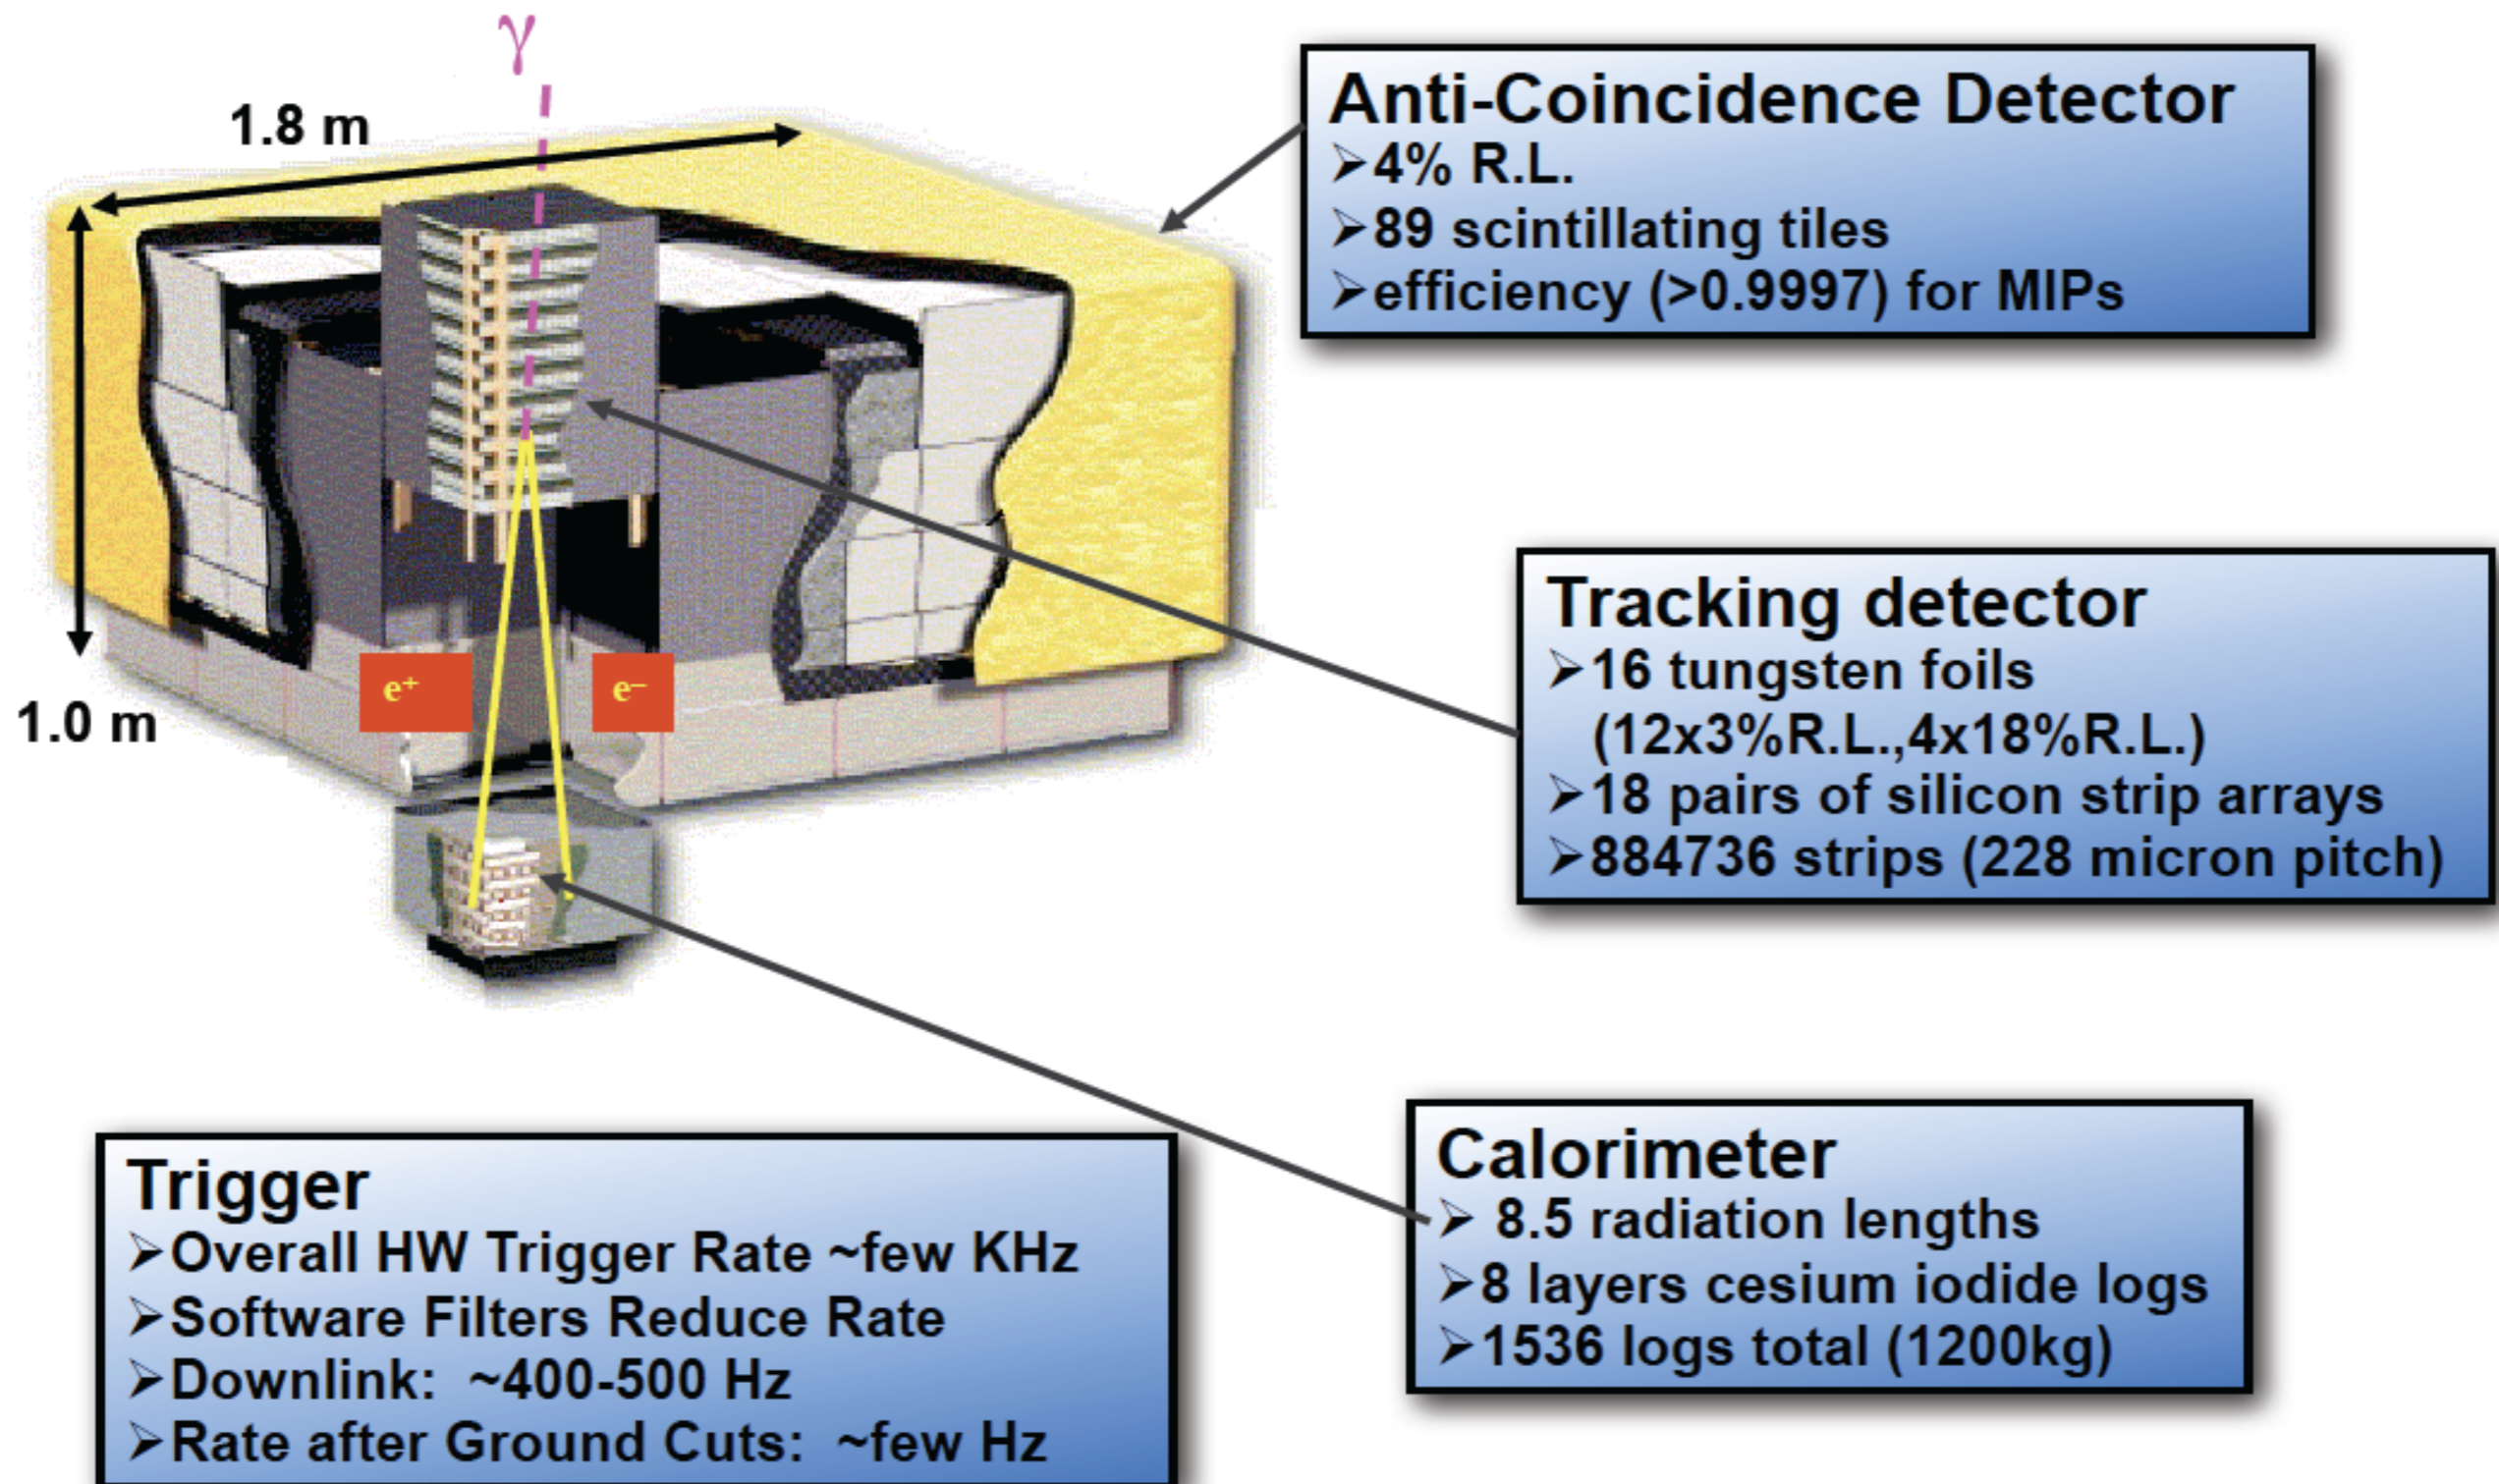

Launch of Fermi

- Very Successful Launch!
- Orbit:
 - ★ Altitude: 565 km
 - ★ Inclination: 25.6 deg
 - ★ Period: ~90 min
- Turn off through SAA
- Lifetime: 5 years min.
 - ★ No expendable

Fermi Large Area Telescope: Particle Detector in Space

New Claims that DM is better than Stellar Distributions

McDermott et al (2022) [follow on to Cholis et al (2022)]:

- Shared their models via github

New Claims that DM is better than Stellar Distributions

McDermott et al (2022) [follow on to Cholis et al (2022)]:

- Shared their models via github
- Used same ring-based diffuse models as Pohl et al (2022)

New Claims that DM is better than Stellar Distributions

McDermott et al (2022) [follow on to Cholis et al (2022)]:

- Shared their models via github
- Used same ring-based diffuse models as Pohl et al (2022)
- Our analysis [Song+ 2402.05449] found that:

New Claims that DM is better than Stellar Distributions

McDermott et al (2022) [follow on to Cholis et al (2022)]:

- Shared their models via github
- Used same ring-based diffuse models as Pohl et al (2022)
- Our analysis [Song+ 2402.05449] found that:
 - McDermott+ had an artificial upper limit in their fits on some ring normalizations that was maximized so that the diffuse model did not fit properly, which the authors confirmed

New Claims that DM is better than Stellar Distributions

McDermott et al (2022) [follow on to Cholis et al (2022)]:

- Shared their models via github
- Used same ring-based diffuse models as Pohl et al (2022)
- Our analysis [Song+ 2402.05449] found that:
 - McDermott+ had an artificial upper limit in their fits on some ring normalizations that was maximized so that the diffuse model did not fit properly, which the authors confirmed
 - their bulge model (same as Cholis+) was not centered on GC, which the authors confirmed

New Claims that DM is better than Stellar Distributions

McDermott et al (2022) [follow on to Cholis et al (2022)]:

- Shared their models via github
- Used same ring-based diffuse models as Pohl et al (2022)
- Our analysis [Song+ 2402.05449] found that:
 - McDermott+ had an artificial upper limit in their fits on some ring normalizations that was maximized so that the diffuse model did not fit properly, which the authors confirmed
 - their bulge model (same as Cholis+) was not centered on GC, which the authors confirmed
- These both combined to lead to their erroneous conclusions that

New Claims that DM is better than Stellar Distributions

Conclusions

Conclusions

- The Galactic Center is the best place to look for thermal WIMP annihilation

Conclusions

- The Galactic Center is the best place to look for thermal WIMP annihilation
- The GC is a busy place, but understandable

Conclusions

- The Galactic Center is the best place to look for thermal WIMP annihilation
- The GC is a busy place, but understandable
- The GCE in gamma rays is due to stellar remnants, likely MSPs ([Song et al. 2024](#))

Conclusions

- The Galactic Center is the best place to look for thermal WIMP annihilation
- The GC is a busy place, but understandable
- The GCE in gamma rays is due to stellar remnants, likely MSPs ([Song et al. 2024](#))
- Given this, the GC places the most stringent indirect detection limits on WIMP DM ([Abazajian et al 2020](#))

Conclusions

- The Galactic Center is the best place to look for thermal WIMP annihilation
- The GC is a busy place, but understandable
- The GCE in gamma rays is due to stellar remnants, likely MSPs ([Song et al. 2024](#))
- Given this, the GC places the most stringent indirect detection limits on WIMP DM ([Abazajian et al 2020](#))
- *But the GC in gamma rays remains very interesting (e.g. 2σ evidence for higgsino WIMP DM in GC data analyzed by [Dessert+ arXiv:2207.10090](#))*
