

Euclid Early Release Observations

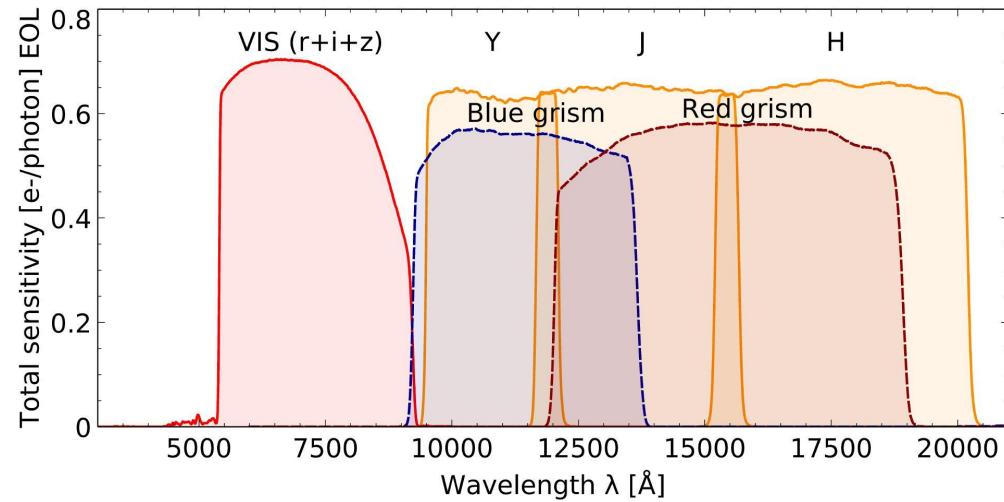

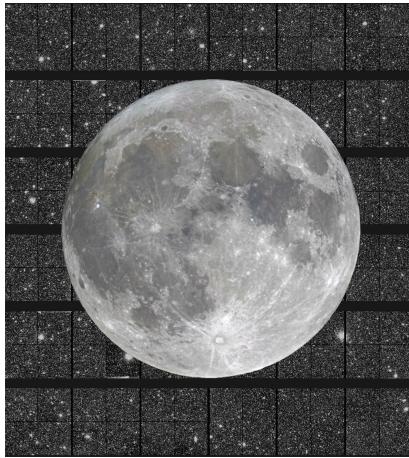

Jean-Charles Cuillandre (CEA Paris-Saclay)

Pretty images paving the way to Euclid's first science results

Euclid Space Telescope

- Primary mirror: 1.2 meter
- Field of view: 0.5 square degree (matched optical/near-infrared)
- FWHM optical: 0.14" (610 Mpx CCD mosaic with 0.1"/px, one single broad band)
- FWHM near-infrared: 0.45" (64 Mpx FPA mosaic with 0.3"/px, three bands)
- Low-resolution grism near-infrared spectroscopy ($R \sim 400$)
- Located at L2 for its 6 year-long DE mission to cover 14 000 square degrees

The wow factor of large astronomical objects

ESA's goal with the ERO (24hr total) : explore the aesthetics of the cosmos through diverse science validation programs on sources filling the Euclid field of view

Pablo Budassi

The first ERO images (fall 2023)

Impact of the aesthetics of the cosmos

The ERO media splash showed how compelling visuals help convey complex concepts, such as hinting at Euclid's mission on dark matter and dark energy

OVERVIEW | ESA MEMBER STATES

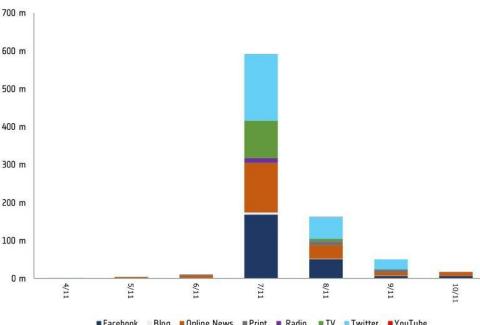

In terms of traditional media within ESA member states, the gross reach amounted to an impressive 342.5 million for the Euclid first images. Traditional media visibility in ESA member states was particularly strong in the UK (thanks in large part to extensive BBC coverage across various channels), France, Spain and Germany which accounted for most of the coverage.

Social media represented 60% of all visibility in ESA member states – driven by strong visibility on Facebook and Twitter. Though not a surprise given the highly visual and shareable assets that were being released. Interesting, and positive, to see ESA accounts not featured too prominently in terms of the reach achieved.

Online news was the most visible traditional media format, representing 23% of all visibility in ESA member states. Followed by TV & Radio with 14%. The peak in coverage coming exactly at 14:15, when the under-embargo ended, indicates the success that sending information and assets to media beforehand had in relation to the impact that was generated.
