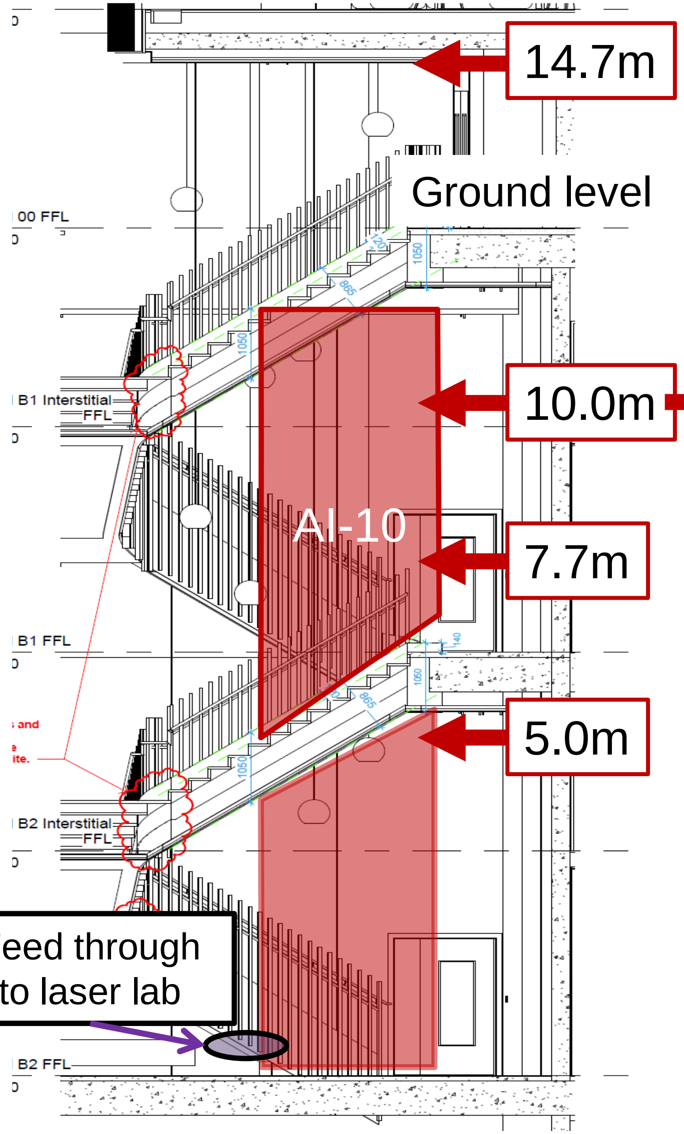
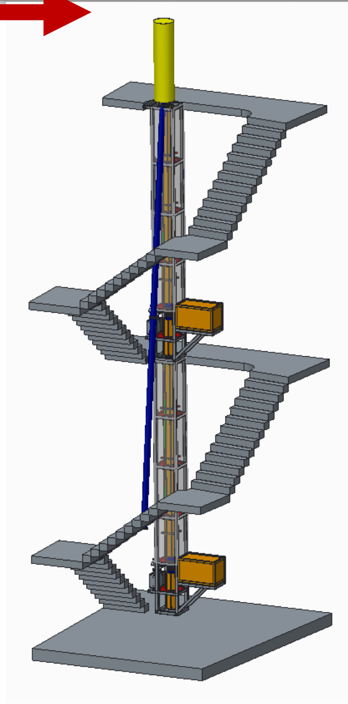
AION Project in the UK

Large Scale AI For Fundamental Physics





L. Badurina et al., *AION: An Atom Interferometer Observatory and Network*, *JCAP* **05** (2020) 011, [arXiv:1911.11755]

Project executed in national partnership with **UK National Quantum Technology Hub in Sensors and Timing, Birmingham, UK,** and international partnership with **The MAGIS Collaboration and The Fermi National Laboratory, US**

To push the state-of-the-art single photon Sr Atom Interferometry, the AION project builds dedicated Ultra-Cold Strontium Laboratories in:
Birmingham, Cambridge, Imperial College, Oxford, and RAL
The laboratories are expected to be fully operational in summer 2023.

The AION Programme consists of 4 Stages

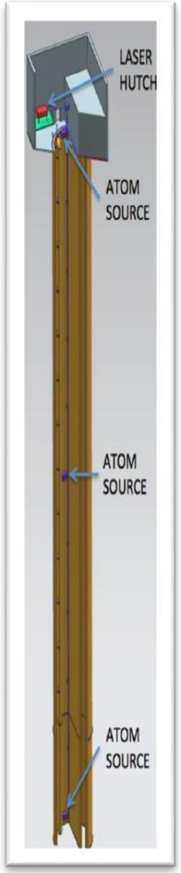
- ❑ **Stage 1:** to build and commission the 10 m detector, develop existing technology and the infrastructure for the 100 m.
- ❑ **Stage 2:** to build, commission and exploit the 100 m detector and carry out a design study for the km-scale detector.
  - ➢ AION was selected in 2018 by STFC as a high-priority medium-scale project.
  - ➢ AION will work in equal partnership with MAGIS in the US to form a “LIGO/Virgo-style” network & collaboration, providing a pathway for UK leadership.

Stage 1 is now funded with about £10M by the QTFP Programme and other sources and Stage 2 could be placed at national facility in Boulby or Daresbury (UK), possibly also at CERN (France/Switzerland).

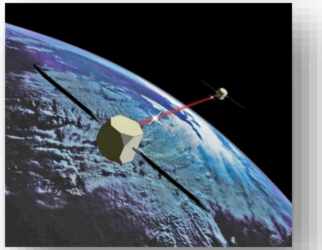
L ~ 10m

L ~ 100m

L ~ 1km



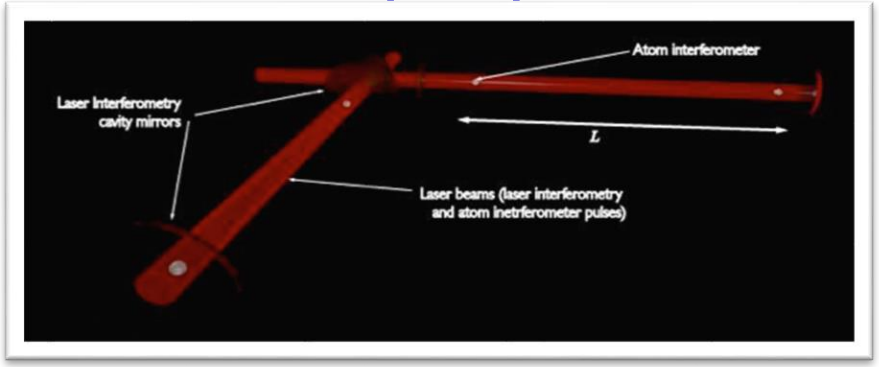
- ❑ **Stage 3:** to build a kilometre-scale terrestrial detector.
- ❑ **Stage 4**: long-term objective a pair of satellite detectors (thousands of kilometres scale) [AEDGE proposal to ESA Voyage2050 call]
  - ➢ AION has established science leadership in AEDGE, bringing together collaborators from European and Chinese groups (e.g. MIGA, MAGIA, ELGAR, ZAIGA).



Stage 3 and 4 will likely require funding on international level (ESA, EU, etc) and AION has already started to build the foundation for it.

Ground Based Large Scale O(100m) Projects

MIGA: Terrestrial detector using atom interferometer at O(100m)
(France)



ZAIGA: Terrestrial detector for large scale atomic interferometers, gyros and clocks at O(100m)

Abstract

We present results from exploratory studies, supported by the Physics Beyond Colliders (PBC) Study Group, of the suitability of a CERN site and its infrastructure for hosting a vertical atom interferometer (AI) with a baseline of about 100 m. We first review the scientific motivations for such an experiment to search for ultralight dark matter and measure gravitational waves, and then outline the general technical requirements for such an atom interferometer, using the AION-100 project as an example. We present a possible CERN site in the PX46 access shaft to the Large Hadron Collider (LHC), including the motivations for this choice and a description of its infrastructure. We then assess its compliance with the technical requirements of such an experiment and what upgrades may be needed. We analyse issues related to the proximity of the LHC machine and its ancillary hardware and present a preliminary safety analysis and the required mitigation measures and infrastructure modifications. In conclusion, we identify primary cost drivers and describe constraints on the experimental installation and operation schedules arising from LHC operation. We find no technical obstacles: the CERN site is a very promising location for an AI experiment with a vertical baseline of about 100 m.

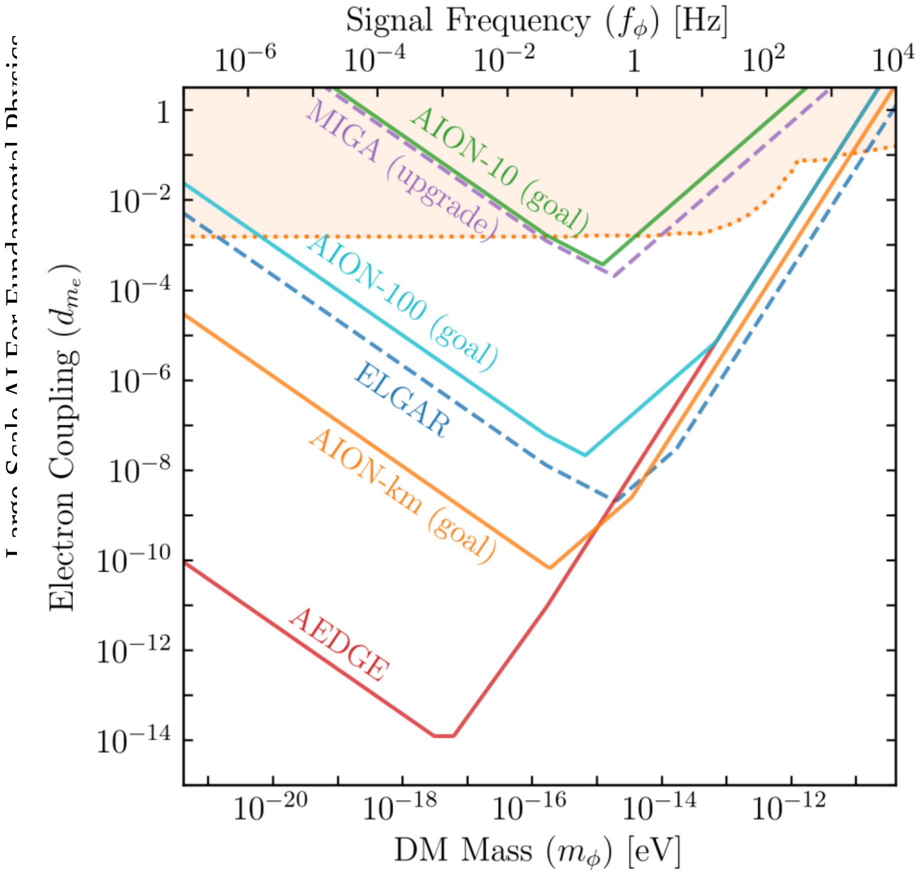
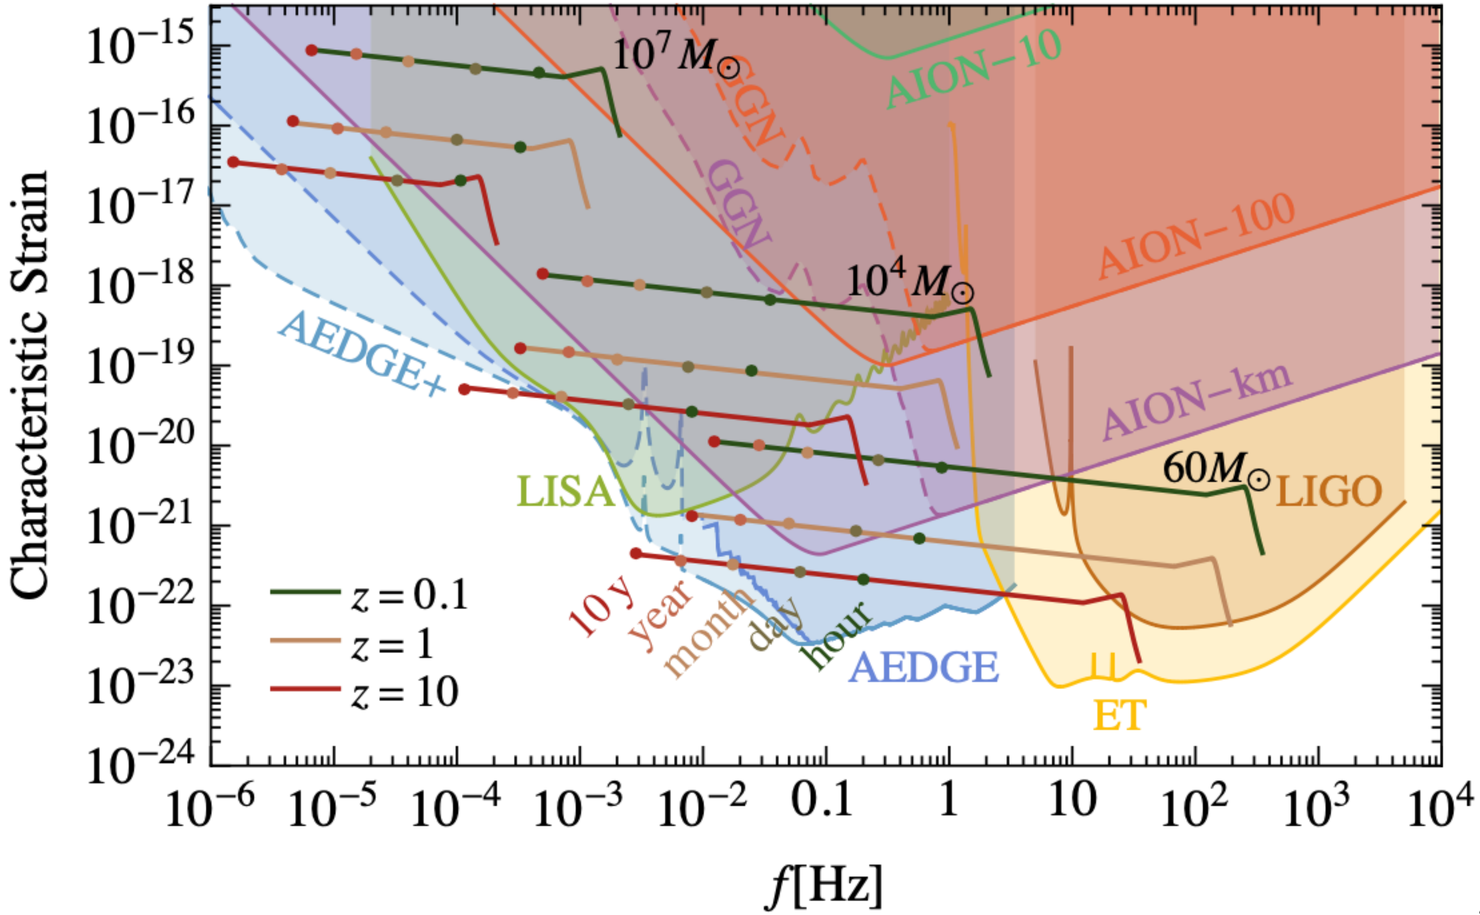
Physics Potential

Unlocking the potential for observation of Ultra-Light Dark Matter and Gravitational Waves from cosmological and astrophysical sources in the unexplored mid-frequency band

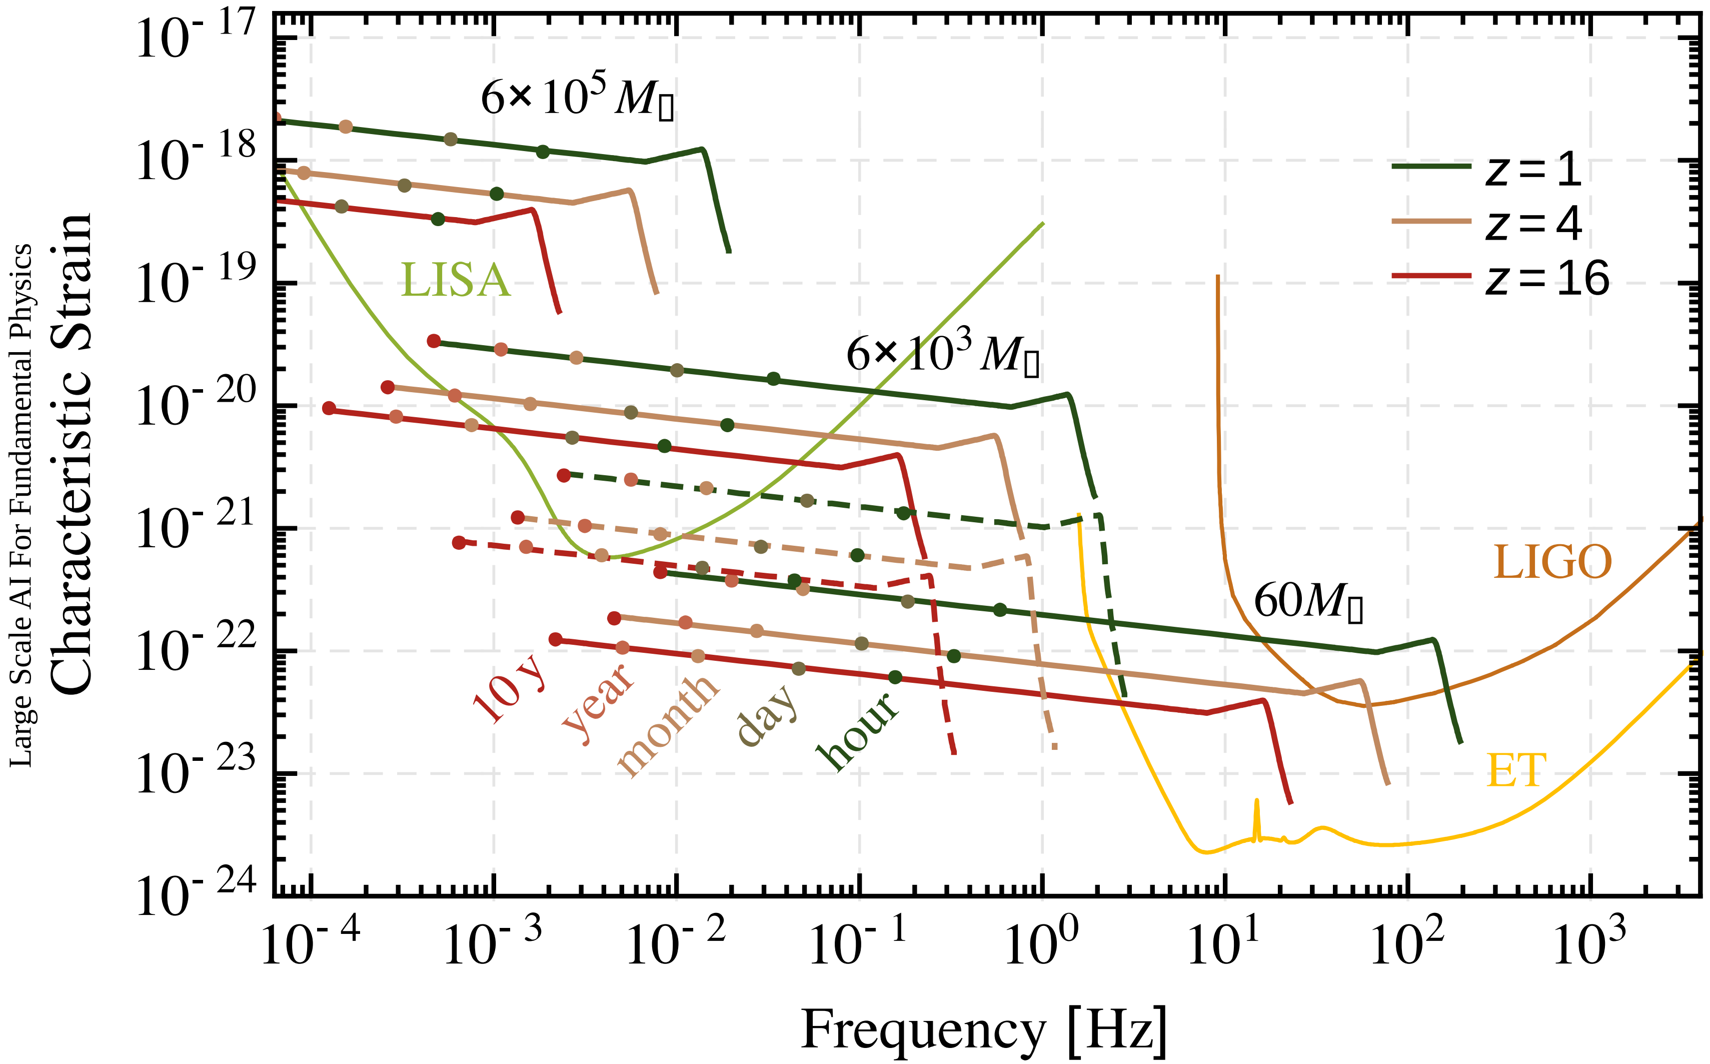




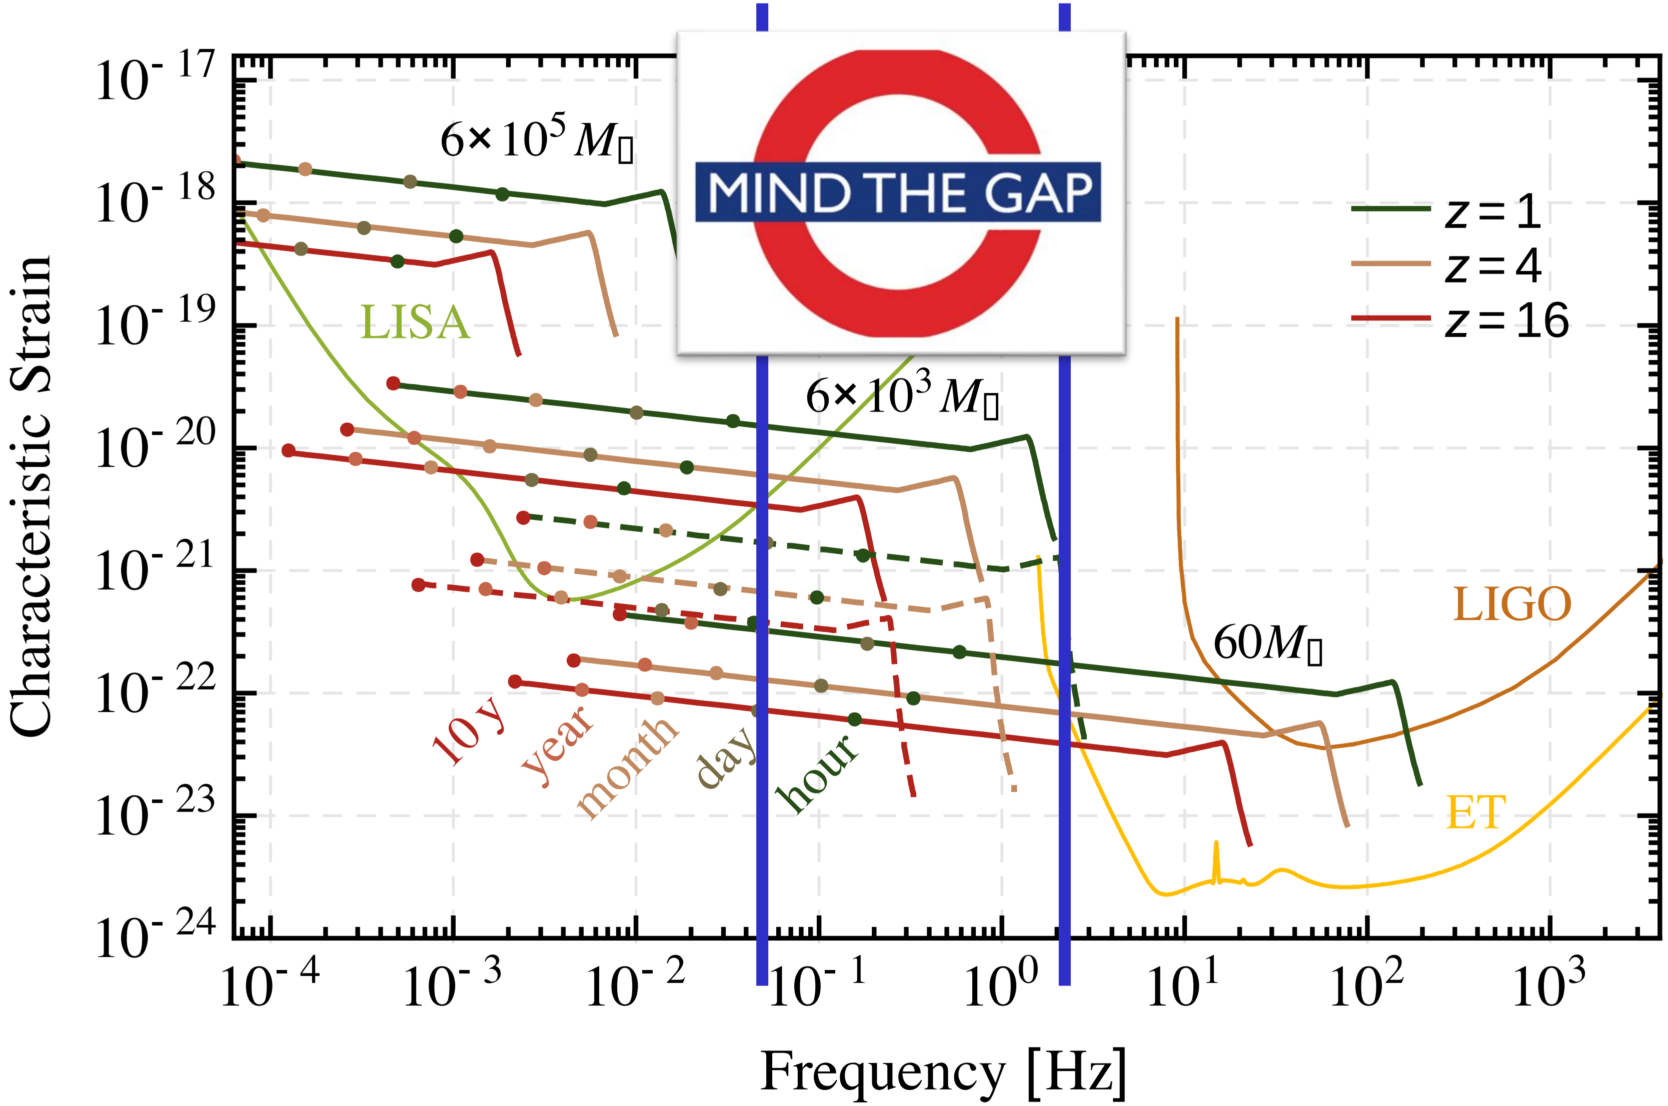
THE SCIENCE CASE

UNEXPLORED MID-FREQUENCY GRAVITATIONAL WAVES

Pathway to the GW Mid-(Frequency)



Pathway to the GW Mid-(Frequency)



Mid-band science

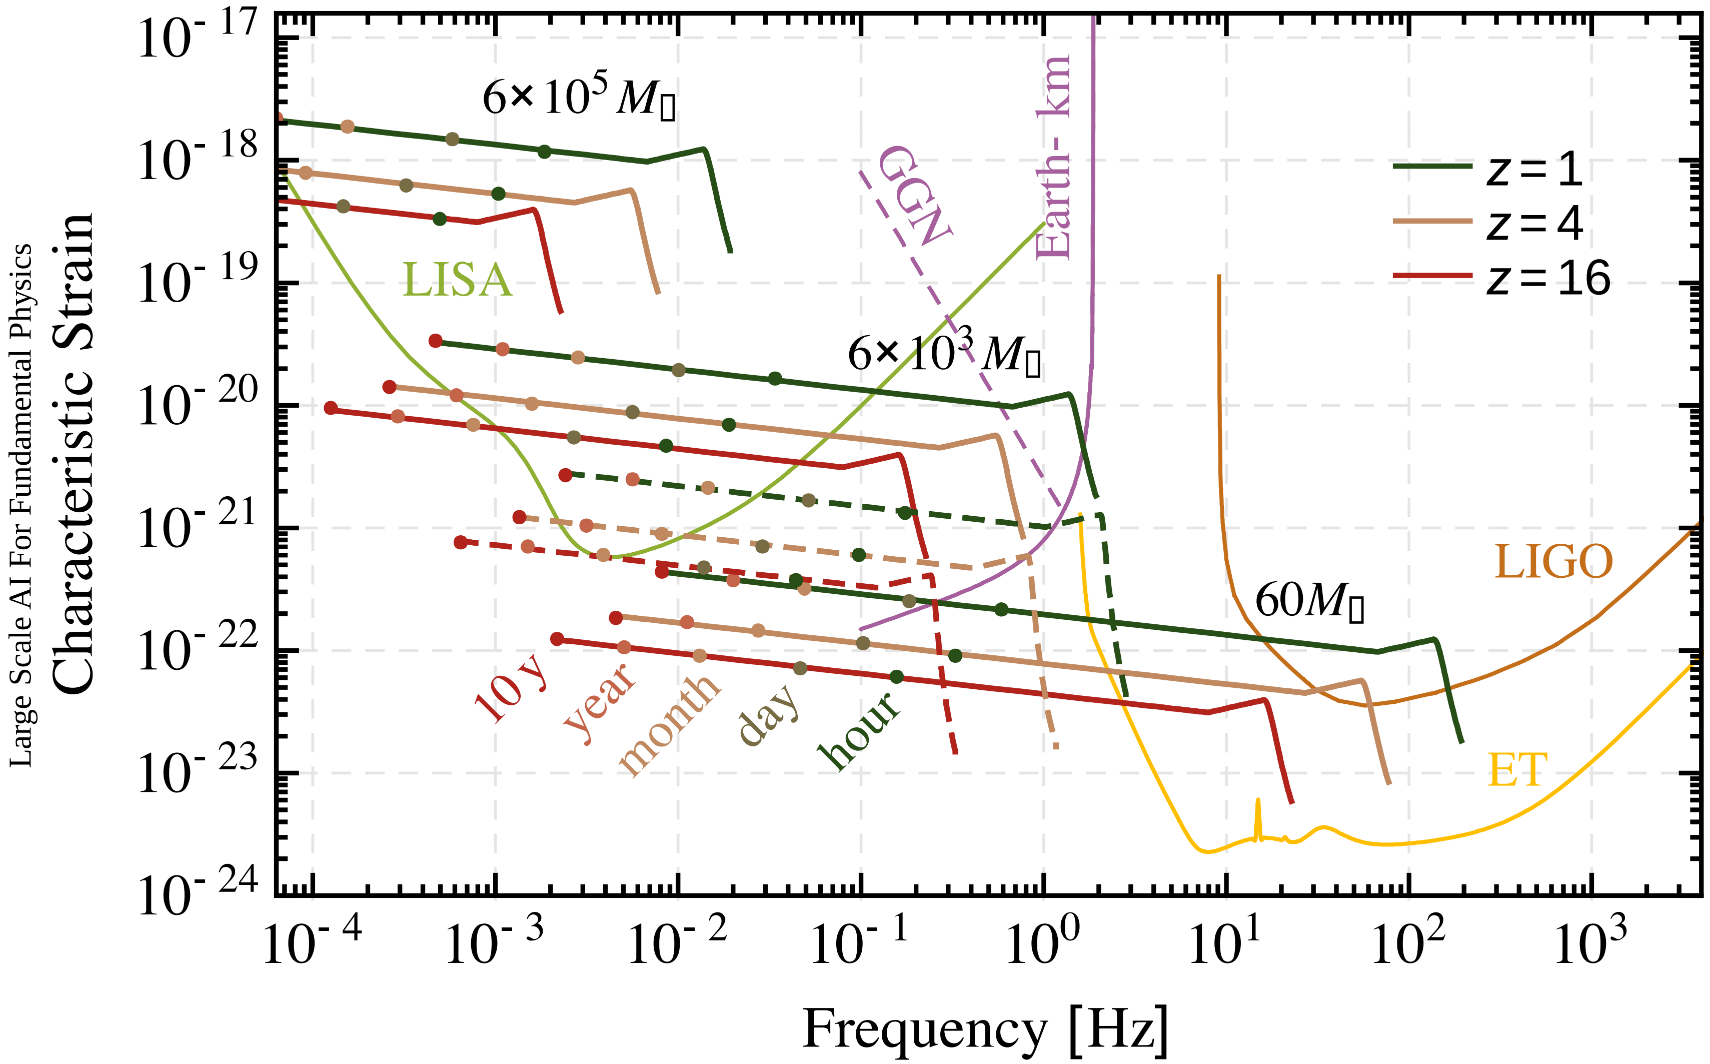
- Detect sources BEFORE they reach the high frequency band [LIGO, ET]
- Optimal for sky localization: predict when and where events will occur (for multi-messenger astronomy)
- Search for Ultra-light dark matter in a similar frequency [i.e. mass] range

Mid-Band currently NOT covered

Imperial College London

AION

AION: Pathway to the GW Mid-(Frequency)



Mid-band science

- Detect sources BEFORE they reach the high frequency band [LIGO, ET]
- Optimal for sky localization: predict when and where events will occur (for multi-messenger astronomy)
- Search for Ultra-light dark matter in a similar frequency [i.e. mass] range

AION: Terrestrial detectors can start filling this gap

Sky position determination

Sky localization precision:

$$\sqrt{\Omega_s} \sim \left(\mathrm{SNR} \cdot \frac{R}{\lambda}\right)^{-1}$$

Mid-band advantages

- Small wavelength λ
- Long source lifetime (~months) maximizes effective R

Benchmark	$\sqrt{\Omega_s}$ [deg]
GW150914	0.16
GW151226	0.20
NS-NS (140 Mpc)	0.19

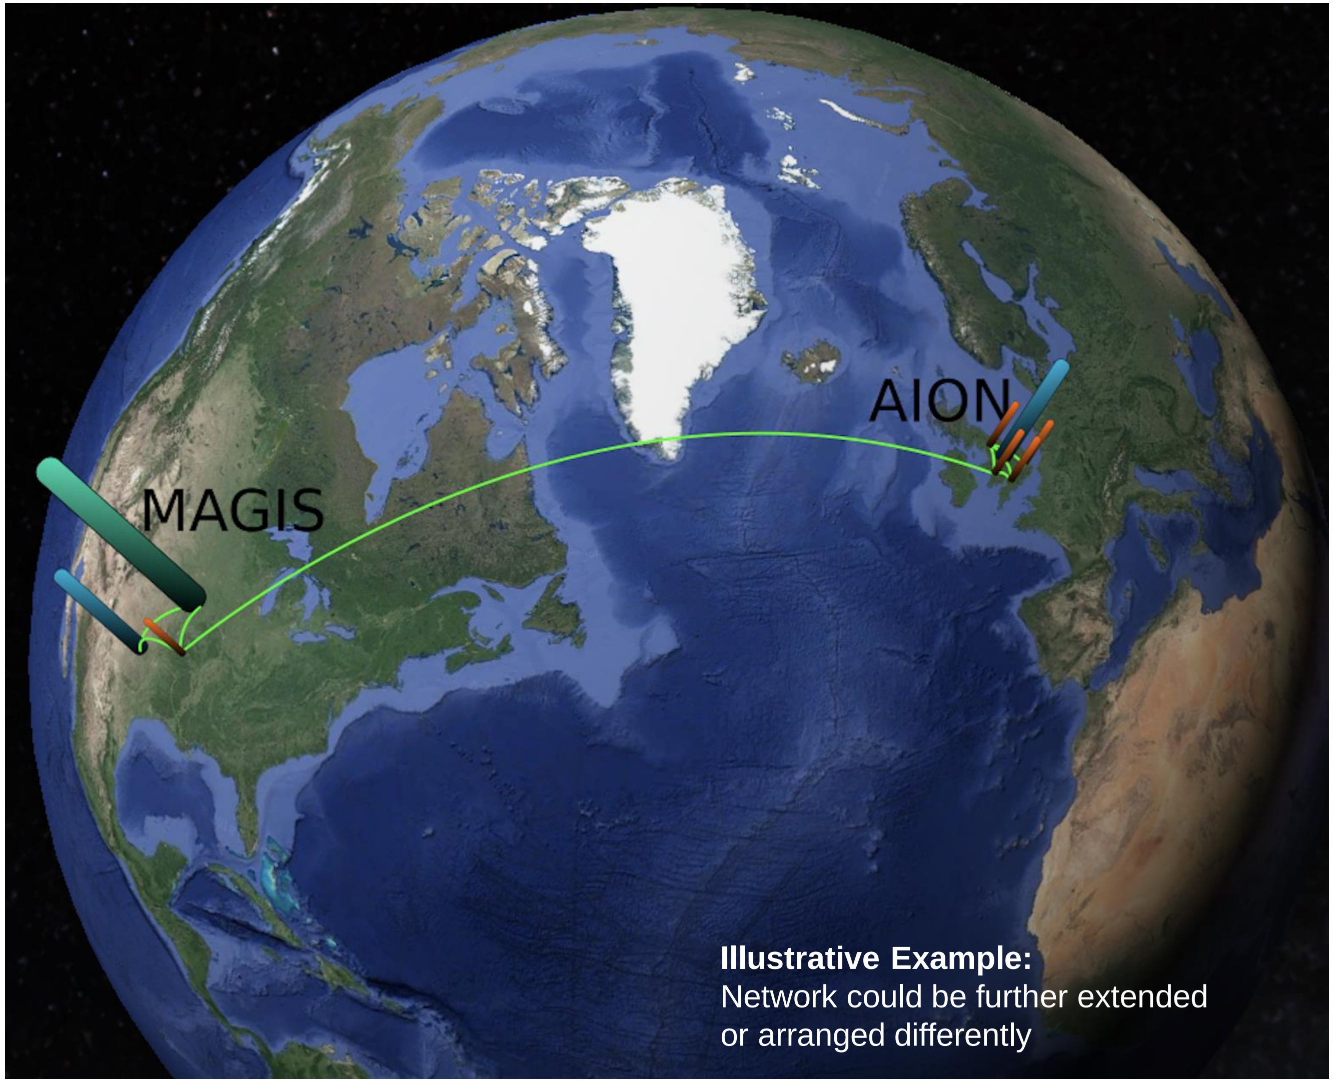
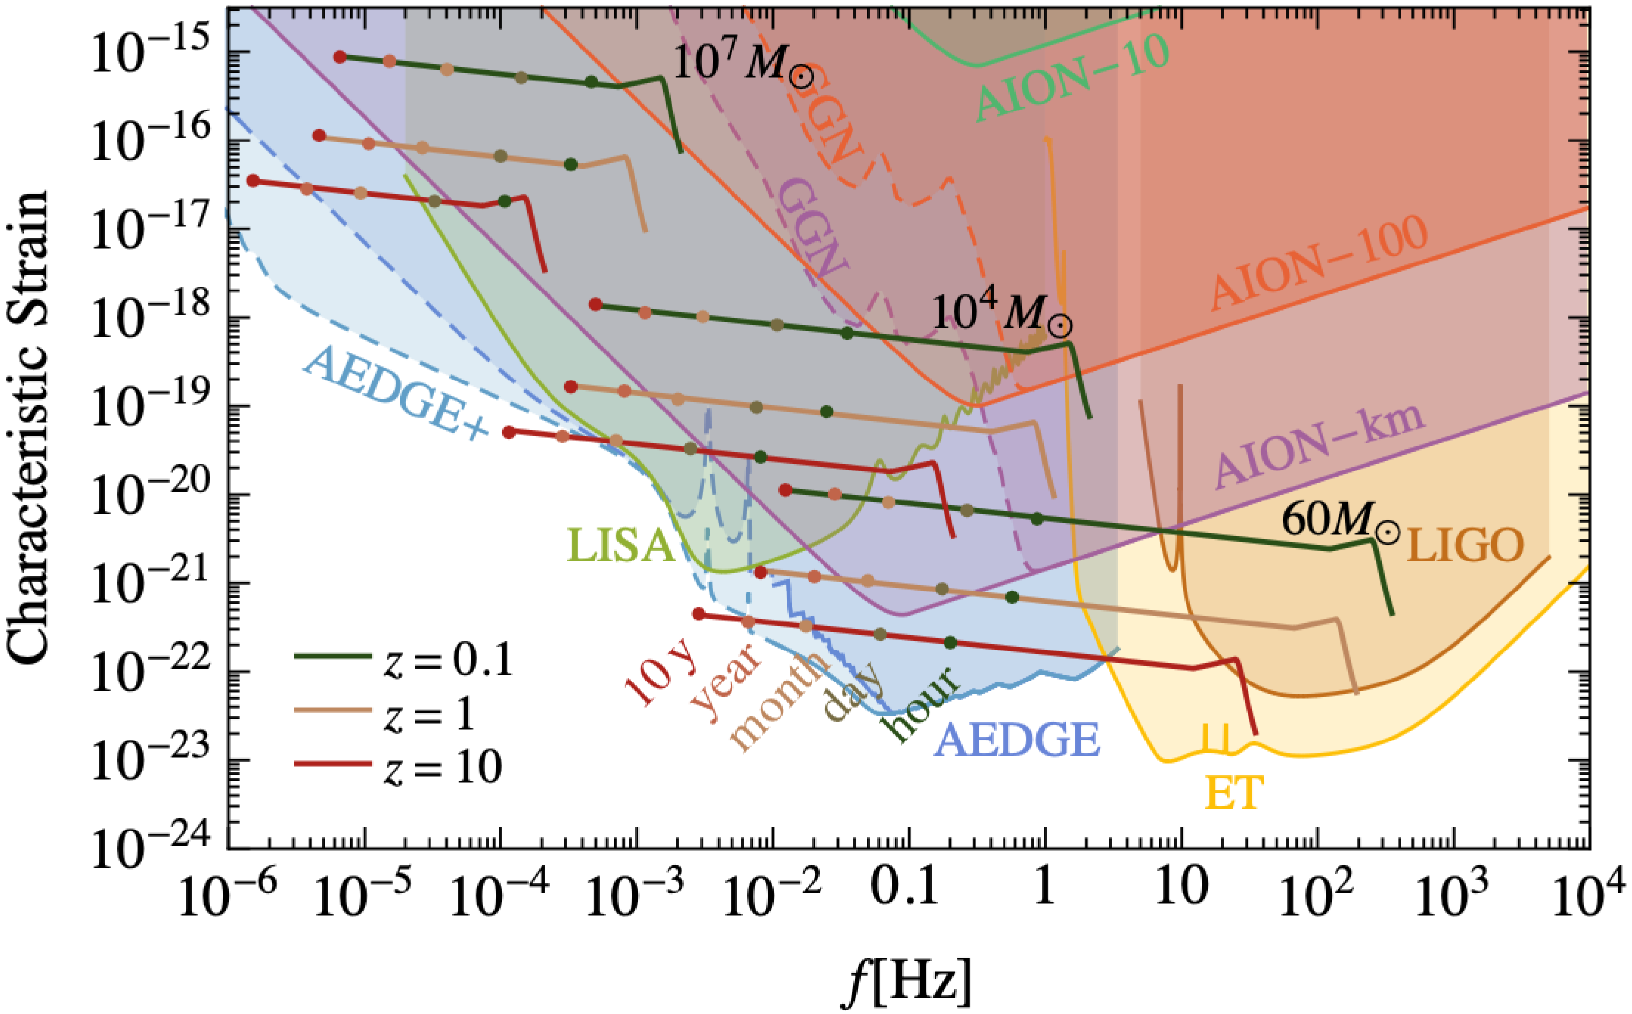
Ultimate sensitivity for terrestrial based detectors is achieved by operating 2 (or more) Detectors in synchronisation mode

Ultimate Goal: Establish International Network



Vision for 2045+

Probe formation of SMBHs: Synergies with other GW experiments (LIGO, LISA), test GR

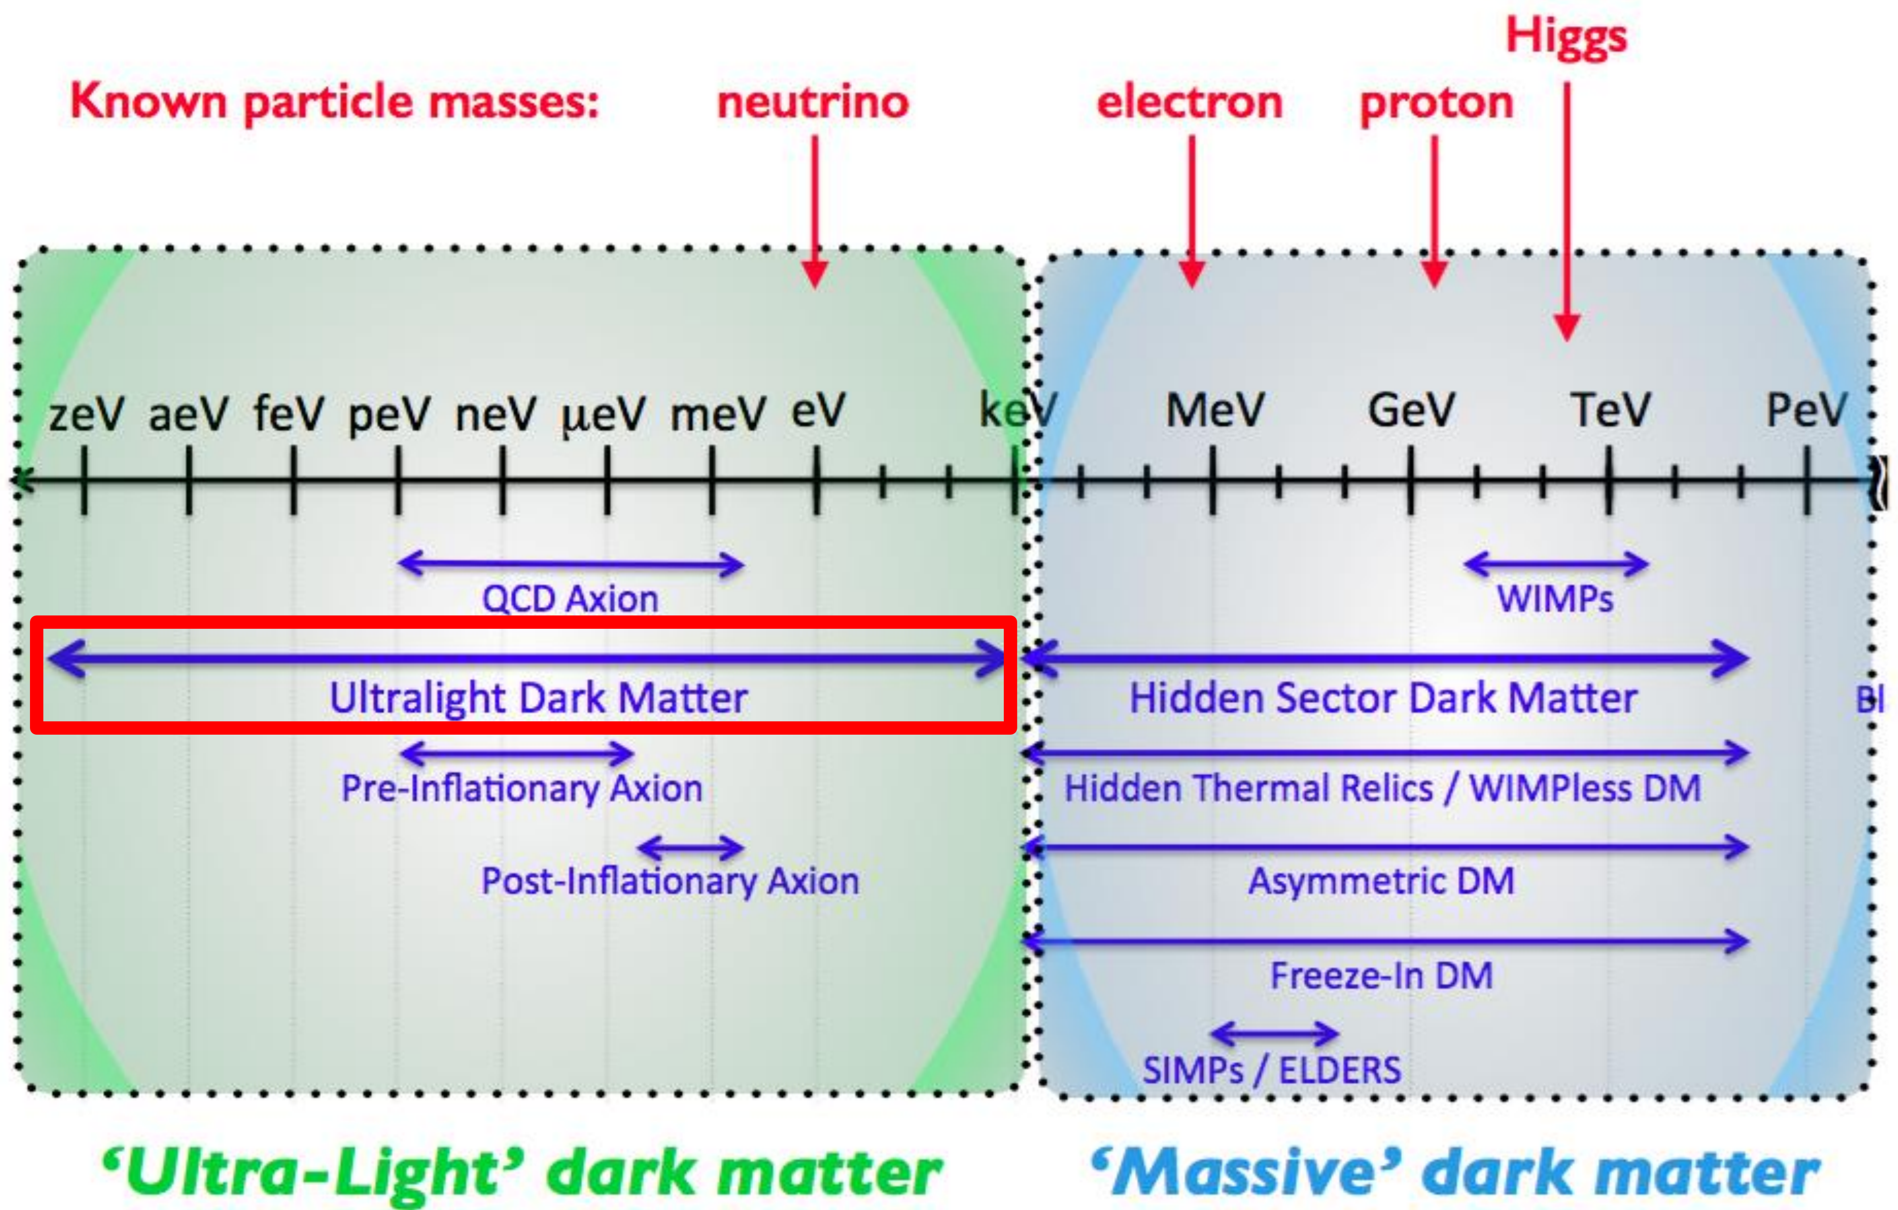


AION Collaboration (Badurina, OB,..., John Ellis et al): arXiv:1911.11755

Badurina, OB, John Ellis, Lewicki, McCabe & Vaskonen: arXiv:2108.02468

ULTRA-LIGHT DARK MATTER

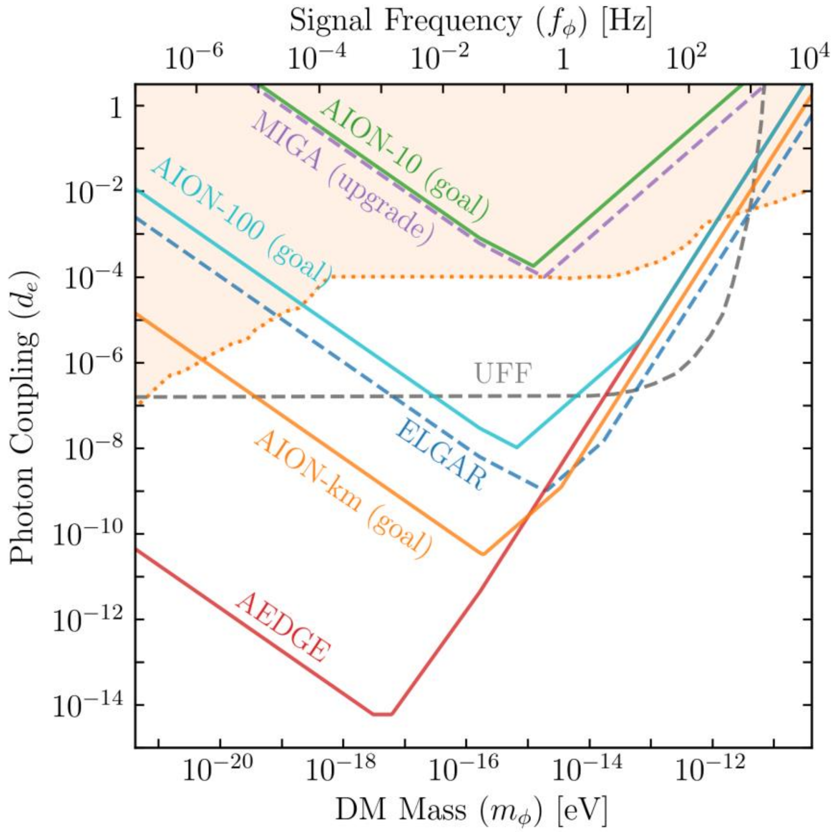
Search for Ultra-Light Dark Matter

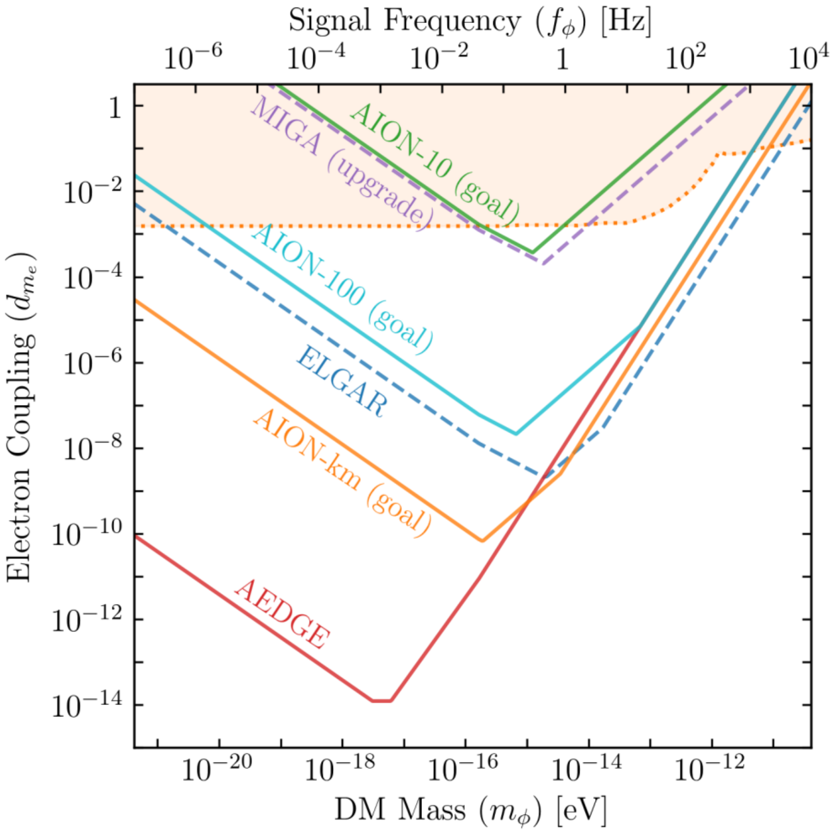


Search for Ultra-Light Dark Matter

Linear couplings to gauge fields and matter fermions

$$\mathcal{L}_{\text{int}\phi} = \kappa\phi \left[+\frac{d_e}{4e^2} F_{\mu\nu}F^{\mu\nu} - \frac{d_g\beta_3}{2g_3} F^A_{\mu\nu}F^{A\mu\nu} - \sum_{i=e,u,d} (d_{m_i} + \gamma_{m_i} d_g) m_i \bar{\psi}_i \psi_i \right]$$





Orders of magnitude improvement over current sensitivities

AION Collaboration (Badurina, …, JE et al): arXiv:1911.11755; Badurina, Buchmueller, JE, Lewicki, McCabe & Vaskonen: arXiv:2108.02468

Other Fundamental Physics

Ultra-high-precision atom interferometry may also be sensitive to other aspects of fundamental physics beyond dark matter and GWs, though studies of such possibilities are still at exploratory stages.

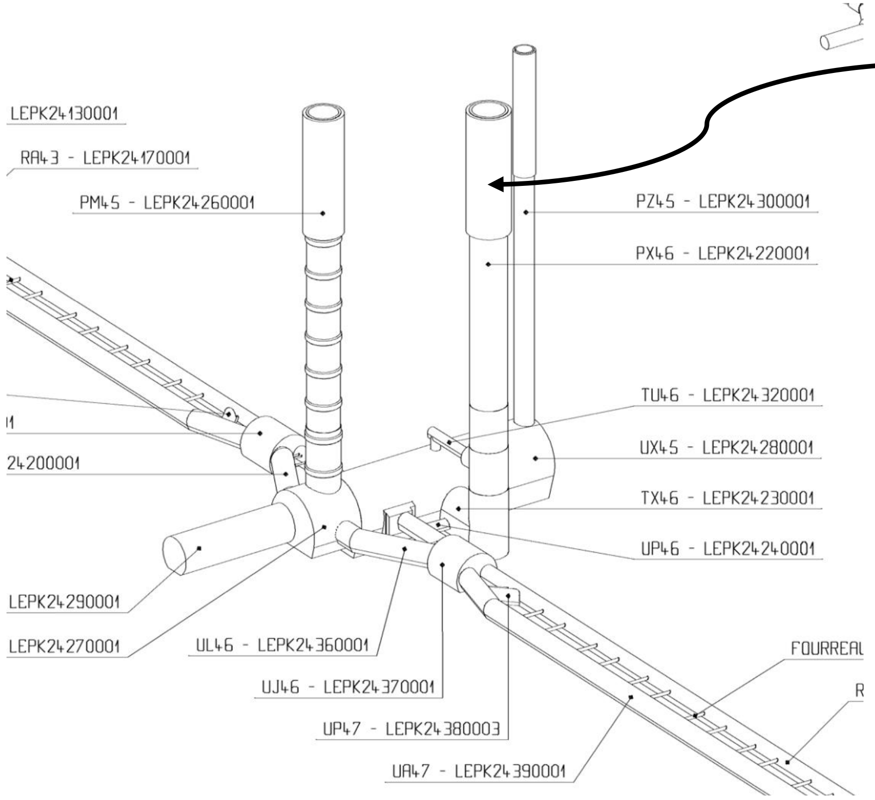
Examples may include:

- The possibility of detecting the astrophysical neutrinos
- Probes of long-range fifth forces.
- Constraining possible variations in fundamental constants.
- Probing dark energy.
- Probes of basic physical principles such as foundations of quantum mechanics and Lorentz invariance.

A very exciting new research avenue is ahead of us ….

BACKUP

Possible CERN Site for AION 100m



PX46 – P4 Support shaft

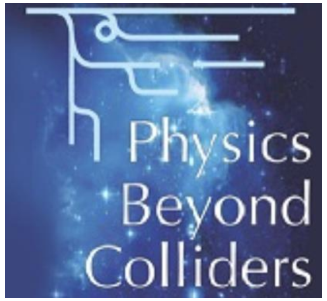
Lengths 143m

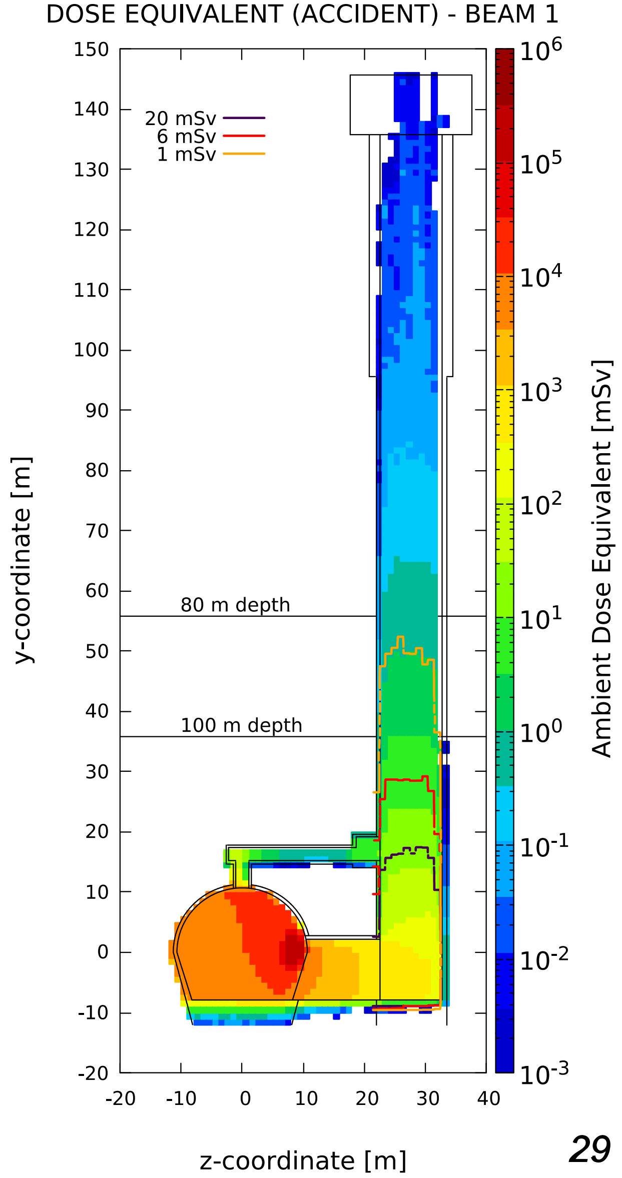
D = 10.10m

- **Ideal basic parameters for AION100**

First radiation studies are also Looking promising but more work is needed to determine if PX46 could be a valid option for AION 100.

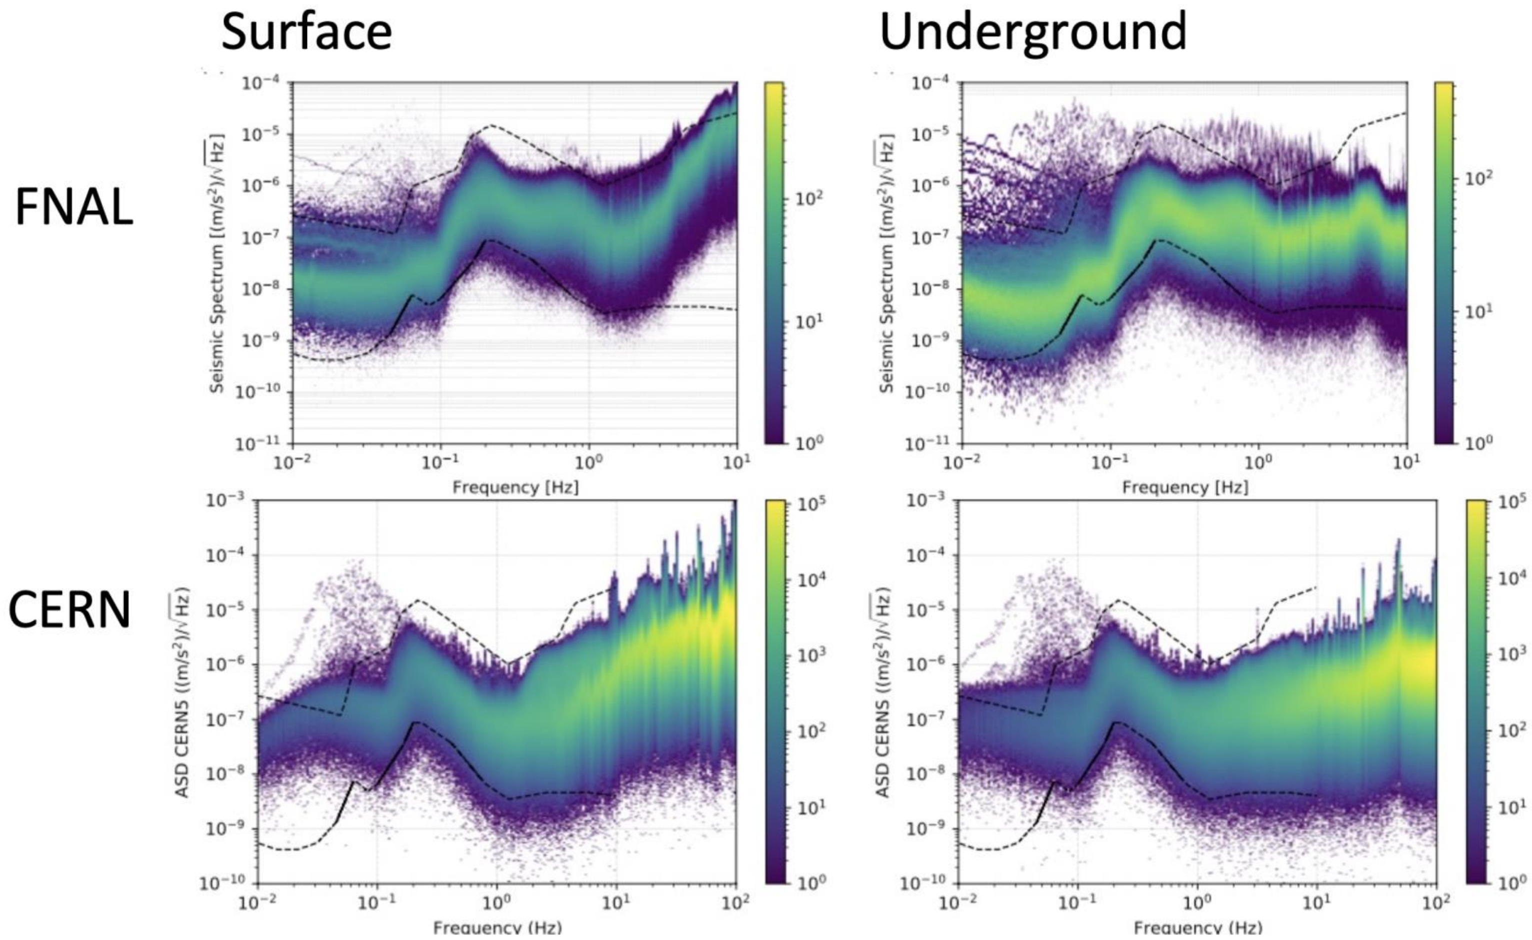
We are working with PBC Team on this feasibility study

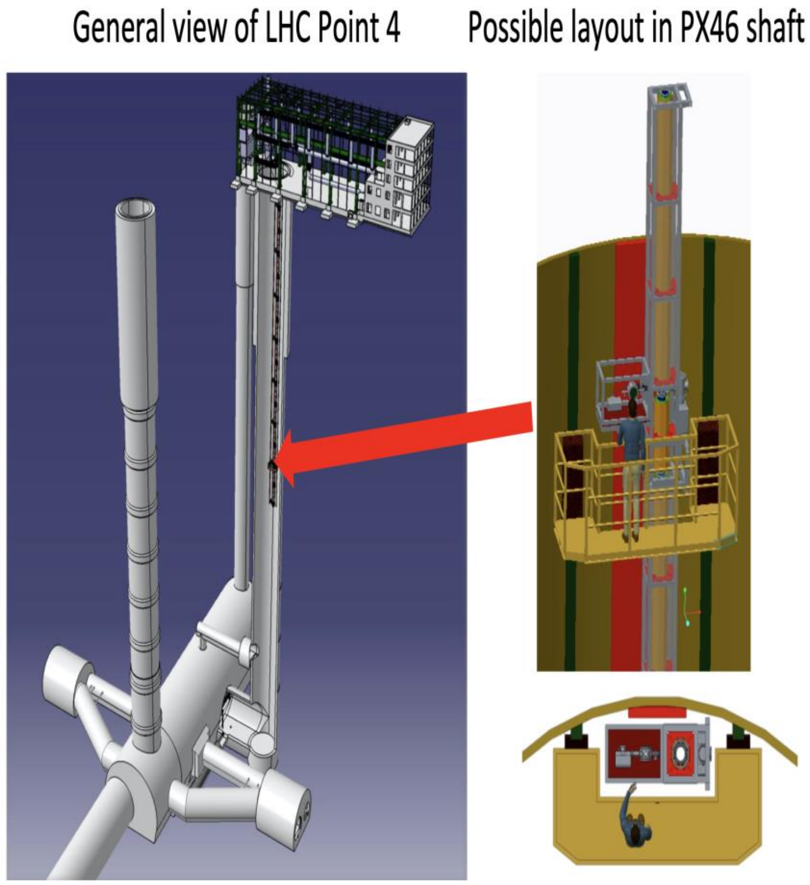




Other site options that are currently investigated are the **national facility in Boulby and Daresbury (UK).**

A 100 Detector at CERN – Site Investigation



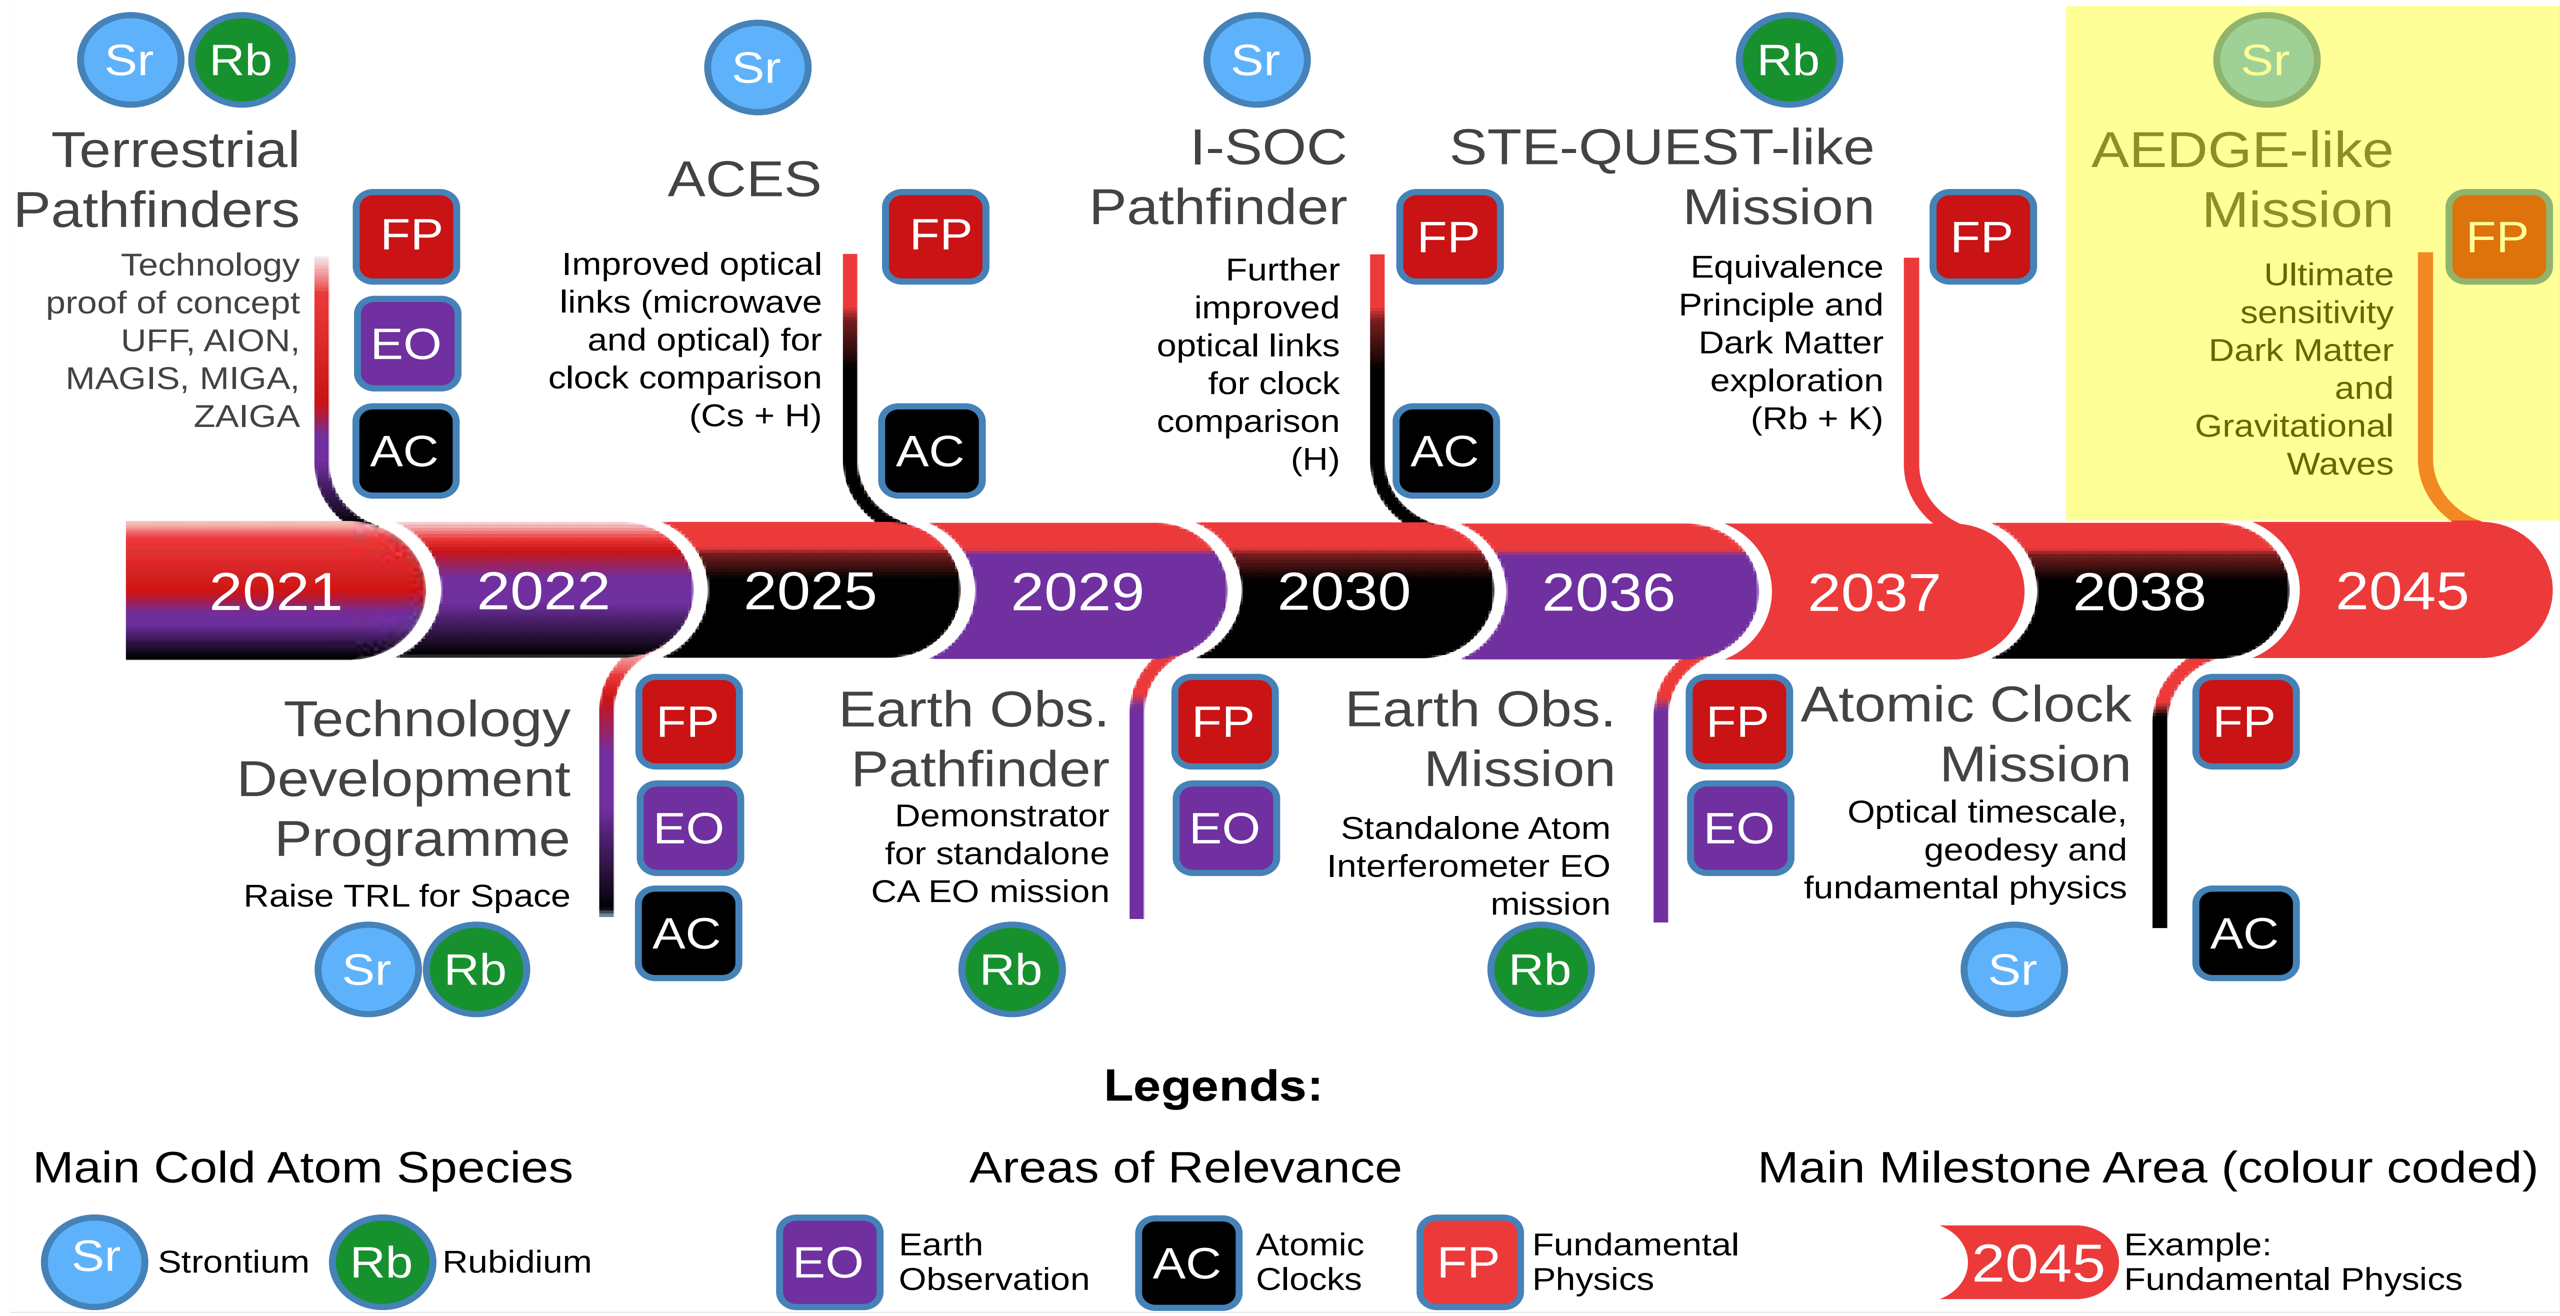


Spectrum similar to that measured at Fermilab for MAGIS

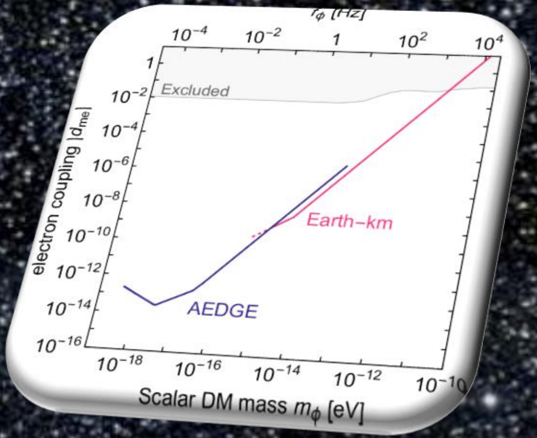
More about the site investigation in the backup

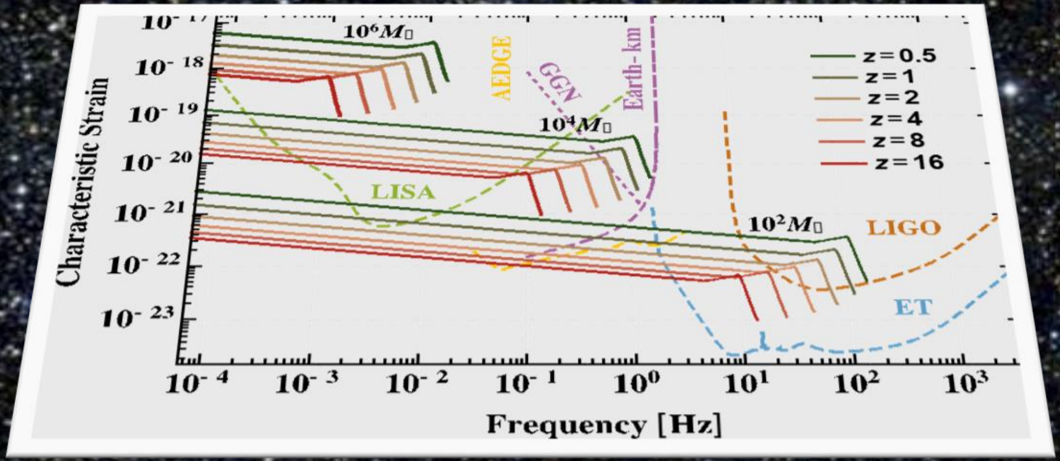
AEDGE AND STE-QUEST

Community Proposal for an ESA Road-Map for Cold Atoms in Space



AEDGE:
Atomic Experiment for Dark Matter and Gravity Exploration





Informal Workshop
CERN, July 22/23 2019

Organizers:
Kai Bongs(CA), Philippe Bouyer(CA), Oliver Buchmueller(PP),
Albert De Roeck(PP), John Ellis(PP, Theory), Peter Graham (CA, Theory),
Jason Hogan (CA), Wolf von Klitzing(CA), Guglielmo Tino(CA), and AtomQT
PP=Particle Physics
CA=Cold Atoms

AEDGE:
Atomic Experiment for Dark Matter and Gravity Exploration

With more than 130 participants the workshop was very well attended!

The full agenda can be accessed via:
https://indico.cern.ch/event/830432/timetable/

The main scope was to review the landscape of Cold Atom experiments on ground AND in space to eventually establish a roadmap for technology readiness for space.

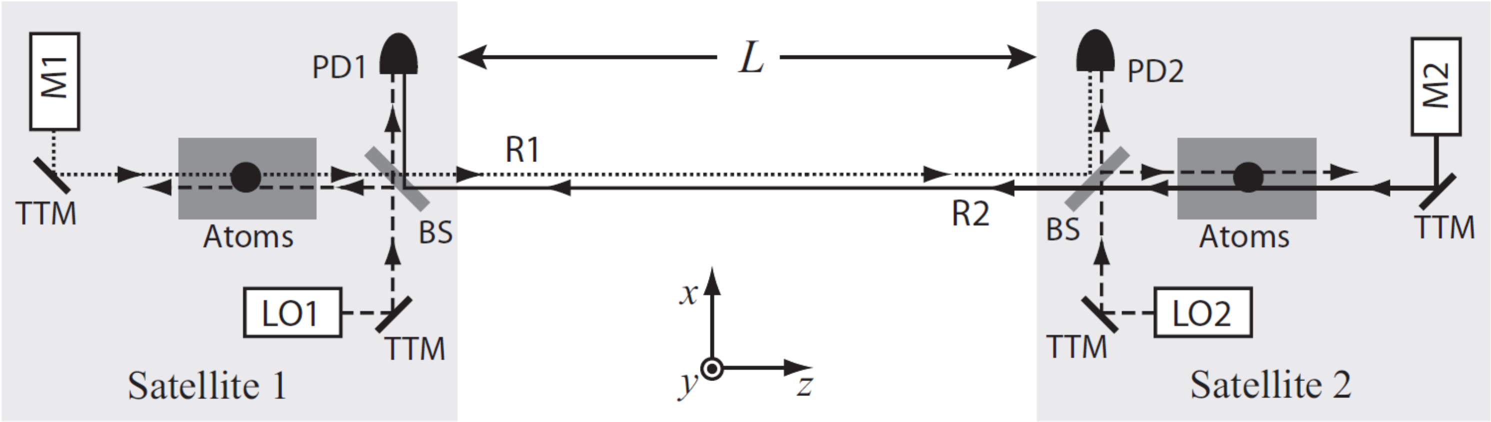
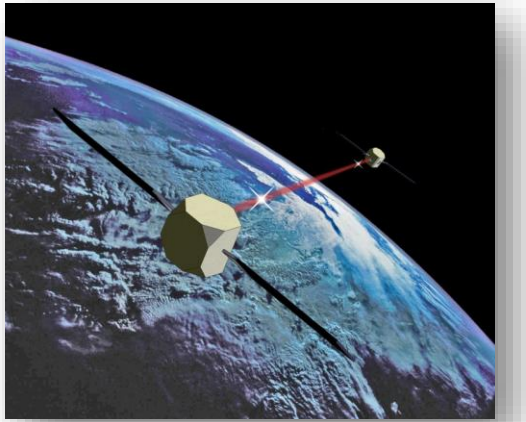
https://arxiv.org/abs/1908.00802

The paper is now published in EPJ Quantum Technology

Potential Mission Design





Using two cold-atom interferometers that perform a relative measurement of differential phase shift, a potential mission profile would be using a pair of satellites separated by a very long baseline L.

Assumed basic parameters:

- Pair of satellites in medium earth orbit (MEO)
- Satellite separation L = 4.4 x 10^7 m

Note: as Laser noise is common-mode suppressed only two satellites are required

A detailed mission outline is provided in: MAGIS collaboration, P. W. Graham et al **arXiv:1711.02225**

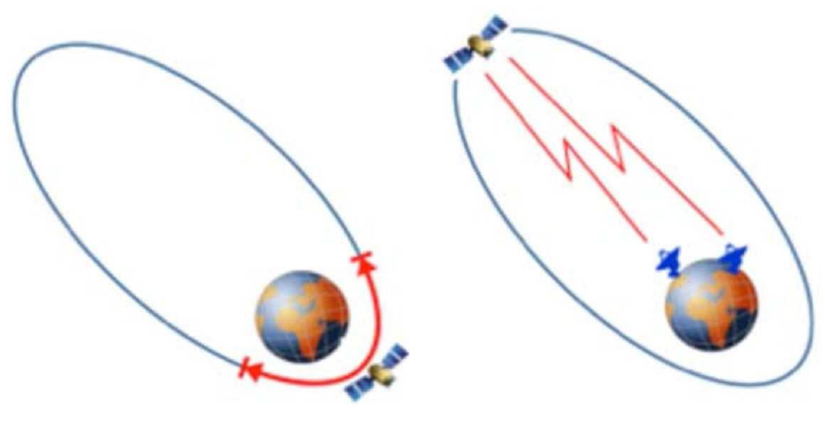
STE-QUEST: An M-class Cold Atom mission to probe gravity, dark matter and quantum mechanics

Science Goals: Equivalent Principal at 1E-17, Ultra-Light Dark Matter, Test of Quantum Mechanics



- Based on STE-QUEST proposals (M3, M4).
- Double atom interferometer with Rb and K "test masses" in non-classical states (quantum superpositions).
- Optimized for UFF test. Assume 700 km circular orbit.
- Apply recent results on controlling gravity gradient shifts by offsetting laser frequencies, thus relaxing atom positioning requirements by factor >100.
- **Reaches 1E-17 target after 18 months of operation.**

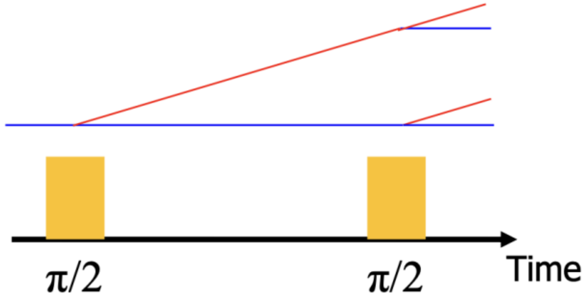
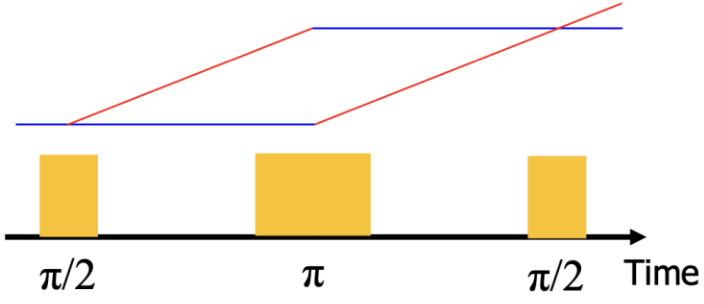
Ramsey sequence (clock)



$$\Delta\phi = \phi_1 - \phi_2 = (\omega - \omega_A)T + kx_1 - kx_2$$
$$= (\omega - \omega_A)T + kvT$$

- Measures velocity

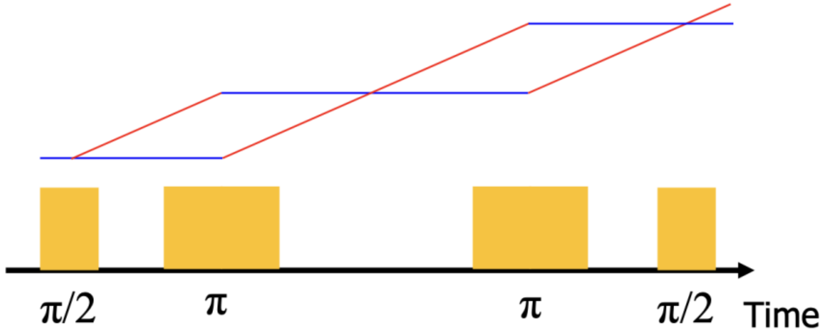
Mach-Zehnder



$$\Delta\phi = (\phi_1 - \phi_2) - (\phi_2 - \phi_3)$$
$$= kv_1T - kv_2T = kaT^2$$

- “Difference” of two Ramsey sequences
- Measures acceleration

“Double diamond”



$$\Delta\phi = ka_1T^2 - ka_2T^2 = k\,\delta a\,T^3$$

- Difference of two MZ loops
- Measures acceleration gradient (in space and/or time)

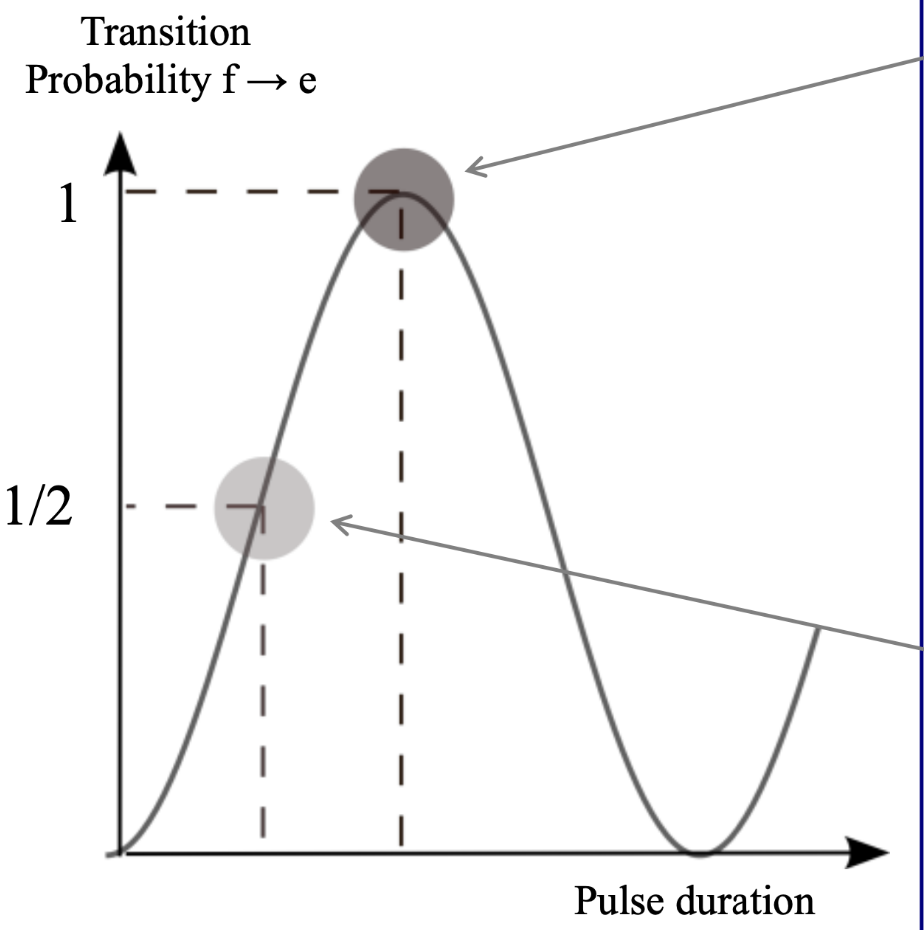
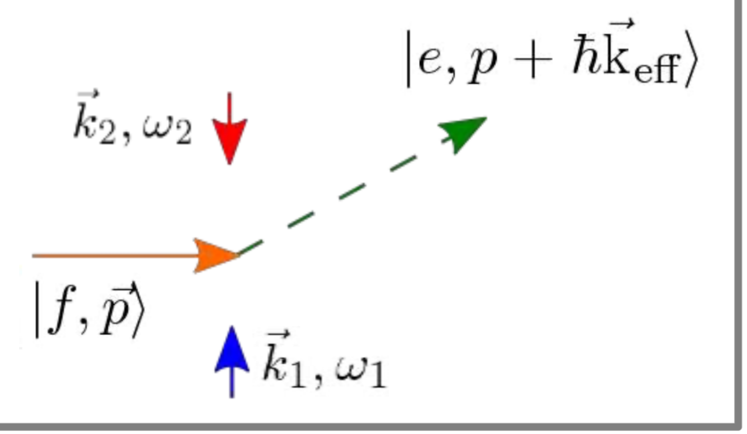
Dimopoulos et al, Phys.Rev.D78:042003,**2008**

Pi and Pi/2 Pluses – Rabi Oscillation

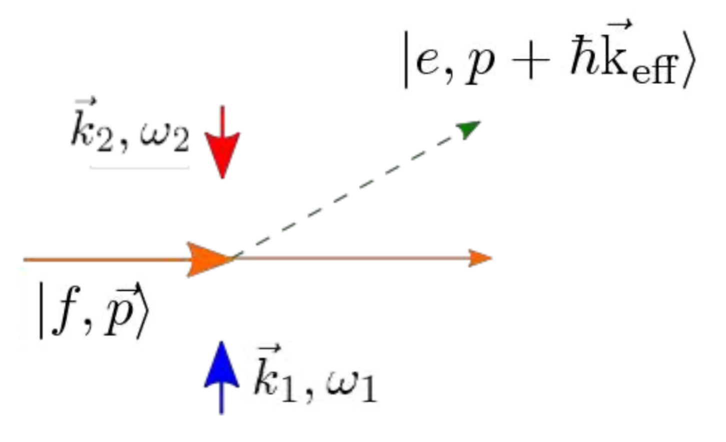
Rabi oscillation between |f> and |e>



"π" pulse = mirror

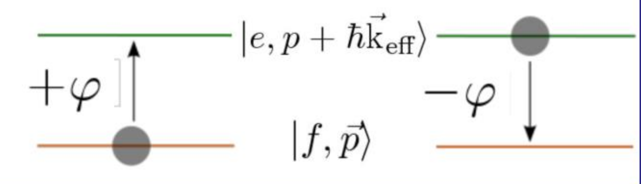


"π/2" pulse = beam splitter



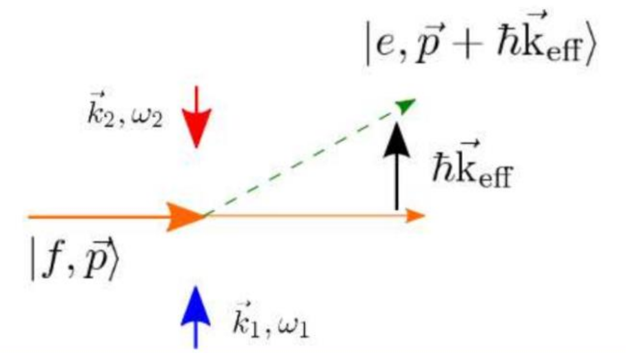
Imprint laser phase on atomic wave-function:

$$\varphi = \phi_1 - \phi_2 = \vec{k}_{\text{eff}} \cdot \vec{r}(t)$$



Momentum tranfser (~1 cm/s)

$$k_{\text{eff}} = k_1 + k_2$$



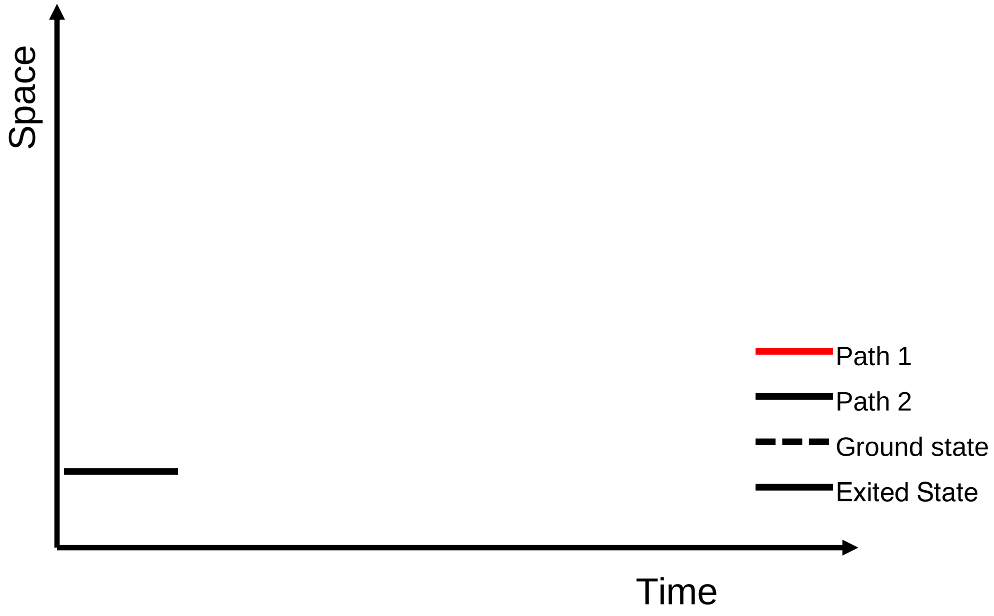
Mach-Zehnder Atom Interferometer – Phase shift

Assuming no other interactions like gravity, etc.

Atoms at rest:

At time before first Pulse:

$$\Phi_1 = 0, \quad \Phi_2 = 0$$



Mach-Zehnder Atom Interferometer – Phase shift

Assuming no other interactions like gravity, etc.

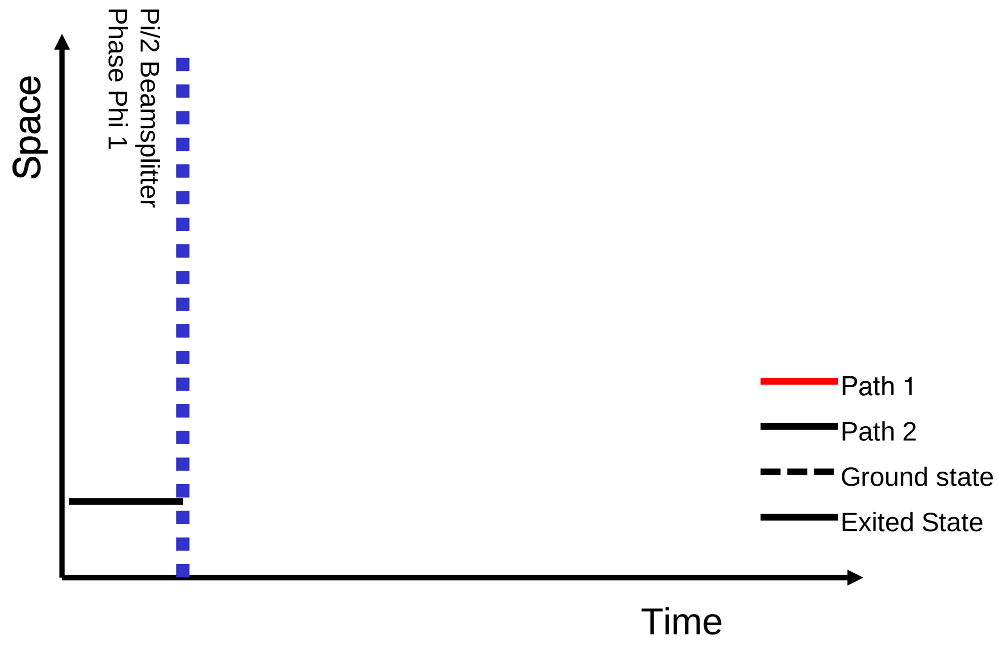
Atoms at rest:

At time before first Pulse:

$$\Phi_1 = 0, \quad \Phi_2 = 0$$

At time $T = 0$ of first $\pi/2$ Pulse:

$$\Phi_1 = \phi_1, \quad \Phi_2 = 0$$



Mach-Zehnder Atom Interferometer – Phase shift

Assuming no other interactions like gravity, etc.

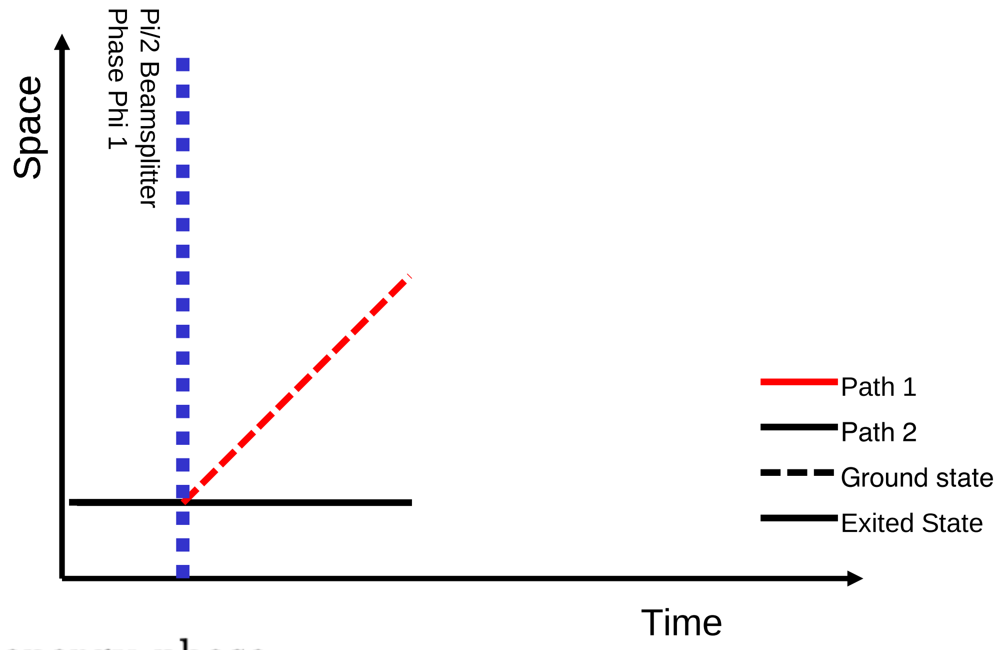
Atoms at rest:

At time before first Pulse:

$$\Phi_1 = 0, \quad \Phi_2 = 0$$

At time $T = 0$ of first $\pi/2$ Pulse:

$$\Phi_1 = \phi_1, \quad \Phi_2 = 0$$



At time $t = T$ just before the π mirror pulse $|1\rangle$ acquired the energy phase $-Et/\hbar = -\omega_a T$

$$\Phi_1 = \phi_1 - ET/\hbar, \quad \Phi_2 = 0$$

Mach-Zehnder Atom Interferometer – Phase shift

Assuming no other interactions like gravity, etc.

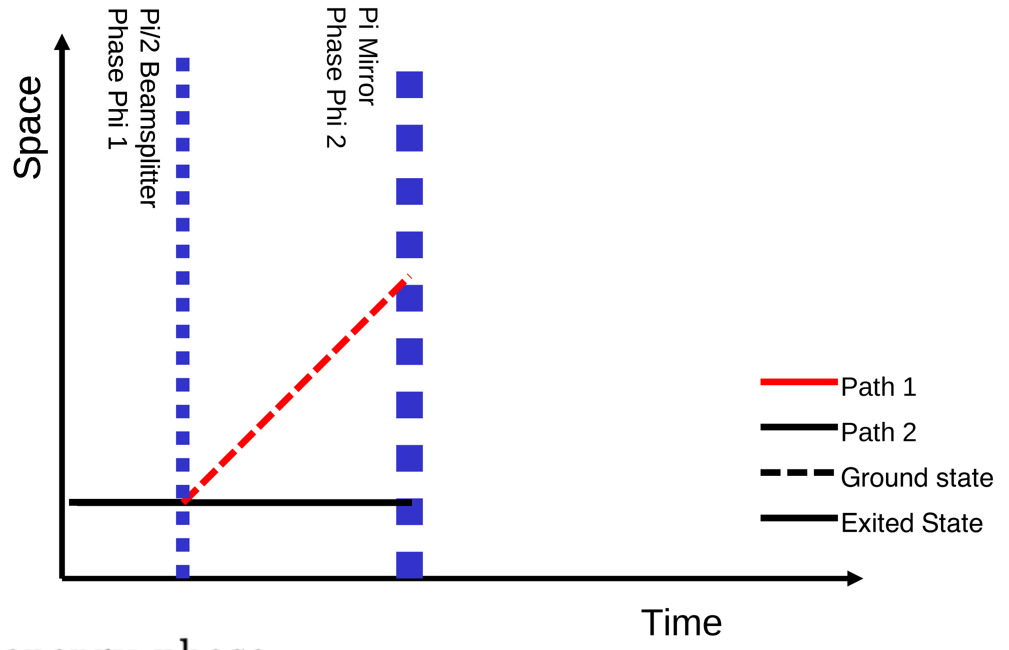
Atoms at rest:

At time before first Pulse:

$$\Phi_1 = 0, \quad \Phi_2 = 0$$

At time $T = 0$ of first $\pi/2$ Pulse:

$$\Phi_1 = \phi_1, \quad \Phi_2 = 0$$



At time $t = T$ just before the π mirror pulse $|1\rangle$ acquired the energy phase $-Et/\hbar = -\omega_a T$

$$\Phi_1 = \phi_1 - ET/\hbar, \quad \Phi_2 = 0$$

At time $t = T$ of the π Pulse:

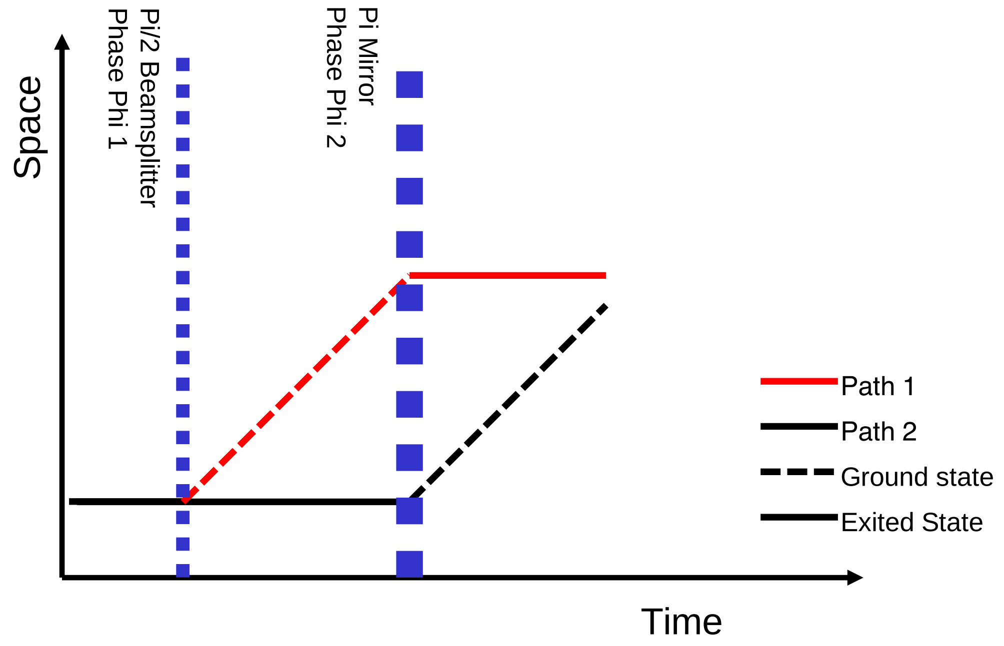
$$\Phi_1 = \phi_1 - ET/\hbar - \phi_2, \quad \Phi_2 = \phi_2$$

Mach-Zehnder Atom Interferometer – Phase shift

Assuming no other interactions like gravity, etc.

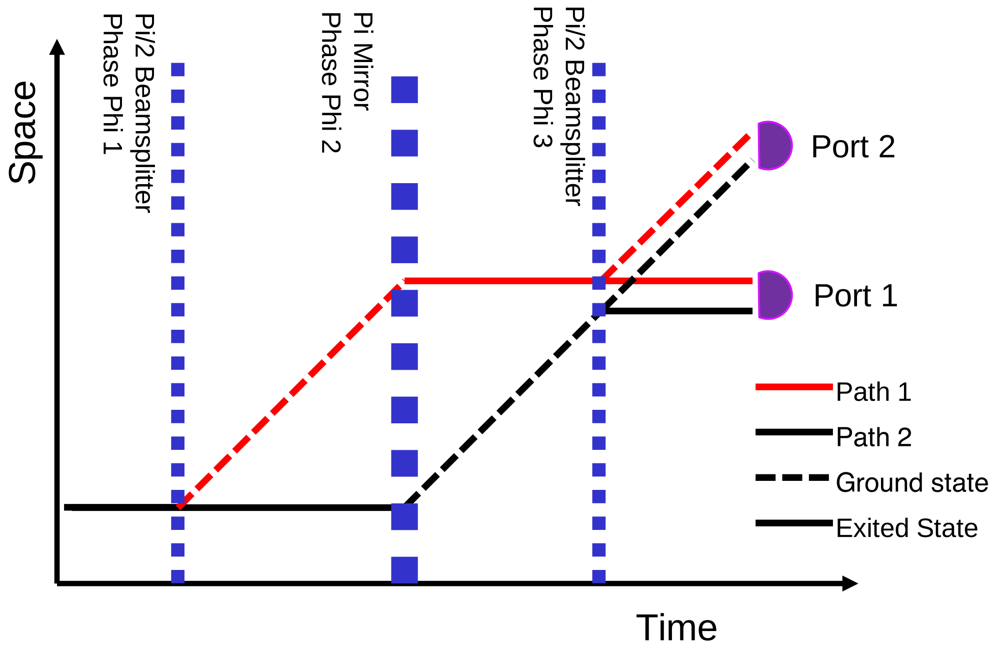
At time $t = 2T$ just before the next $\pi/2$ mirror pulse:

$$\Phi_1 = \phi_1 - ET/\hbar - \phi_2, \quad \Phi_2 = \phi_2 - ET/\hbar$$



Mach-Zehnder Atom Interferometer – Phase shift

Assuming no other interactions like gravity, etc.



At time $t = 2T$ just before the next $\pi/2$ mirror pulse:

$$\Phi_1 = \phi_1 - ET/\hbar - \phi_2, \quad \Phi_2 = \phi_2 - ET/\hbar$$

At time $t = 2T$ just after the next $\pi/2$ mirror pulse, we actually split in four components:

At $|0\rangle$ port:

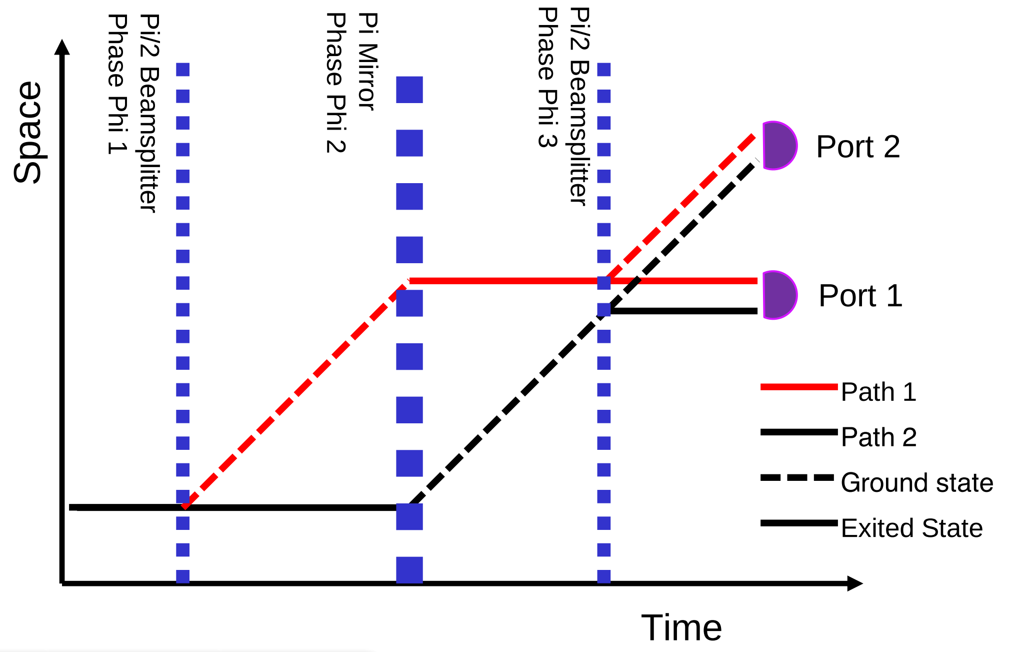
$$\Phi_1 = \phi_1 - ET/\hbar - \phi_2, \quad \Phi_2 = \phi_2 - ET/\hbar - \phi_3$$

At $|1\rangle$ port:

$$\Phi_1 = \phi_1 - ET/\hbar - \phi_2 + \phi_3, \quad \Phi_2 = \phi_2 - ET/\hbar$$

Mach-Zehnder Atom Interferometer – Phase shift

Assuming no other interactions like gravity, etc.



Therefore, the phase difference $\Delta\phi = \Phi_1 - \Phi_2$ is:

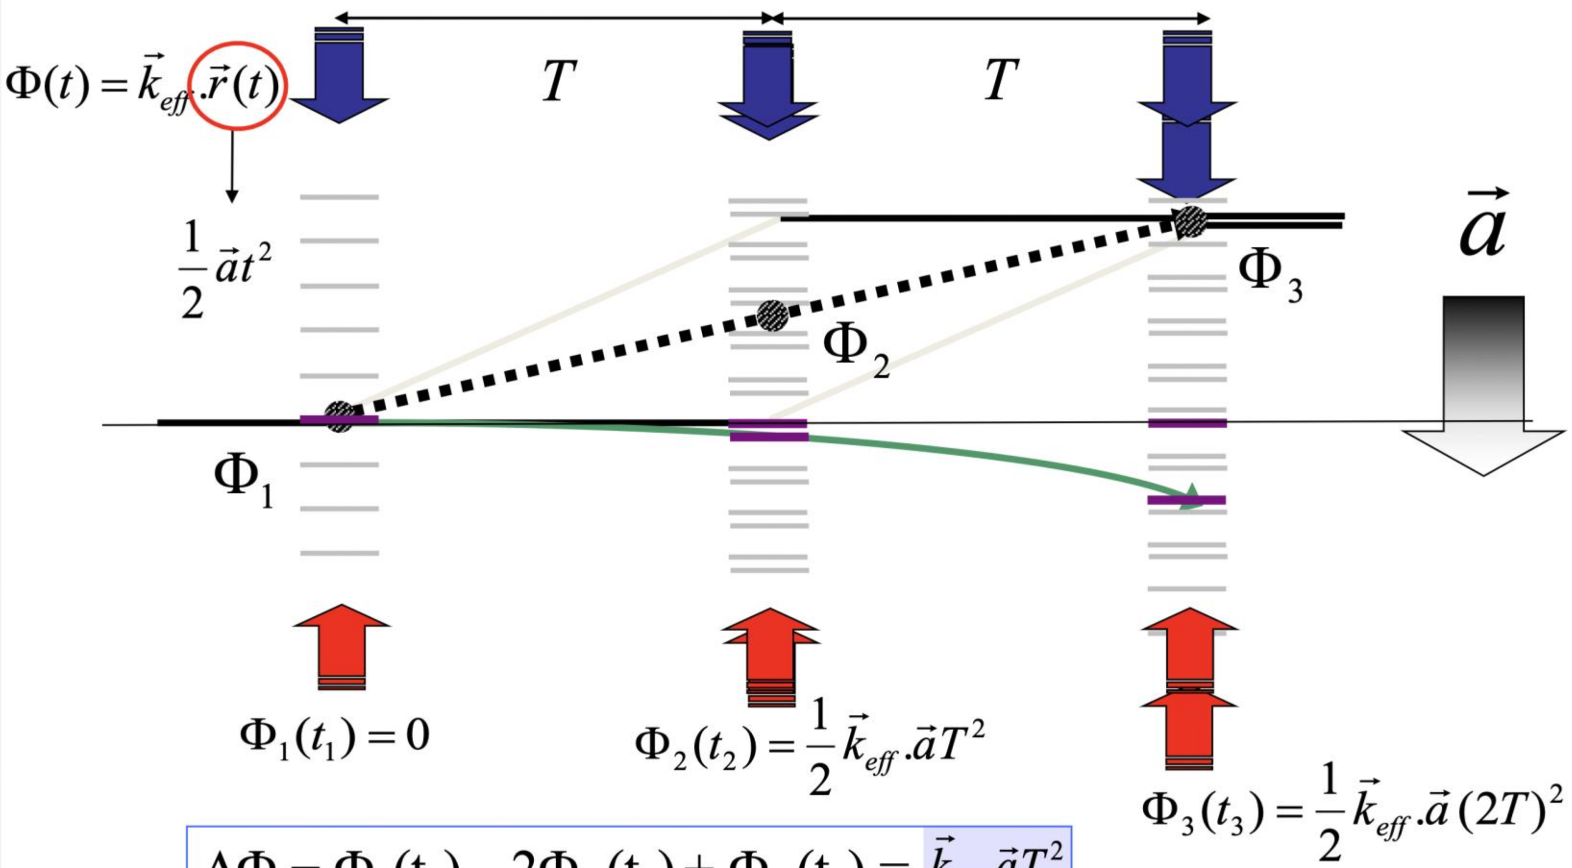
$$\Phi_1 - \Phi_2 = (\phi_1 - ET/\hbar - \phi_2) - (\phi_2 - ET/\hbar - \phi_3) = \phi_1 - 2\phi_2 + \phi_3$$

or

$$\Phi_1 - \Phi_2 = (\phi_1 - ET/\hbar - \phi_2 + \phi_3) - (\phi_2 - ET/\hbar) = \phi_1 + \phi_3 - 2\phi_2$$

MZ Acceleration Phase Shift

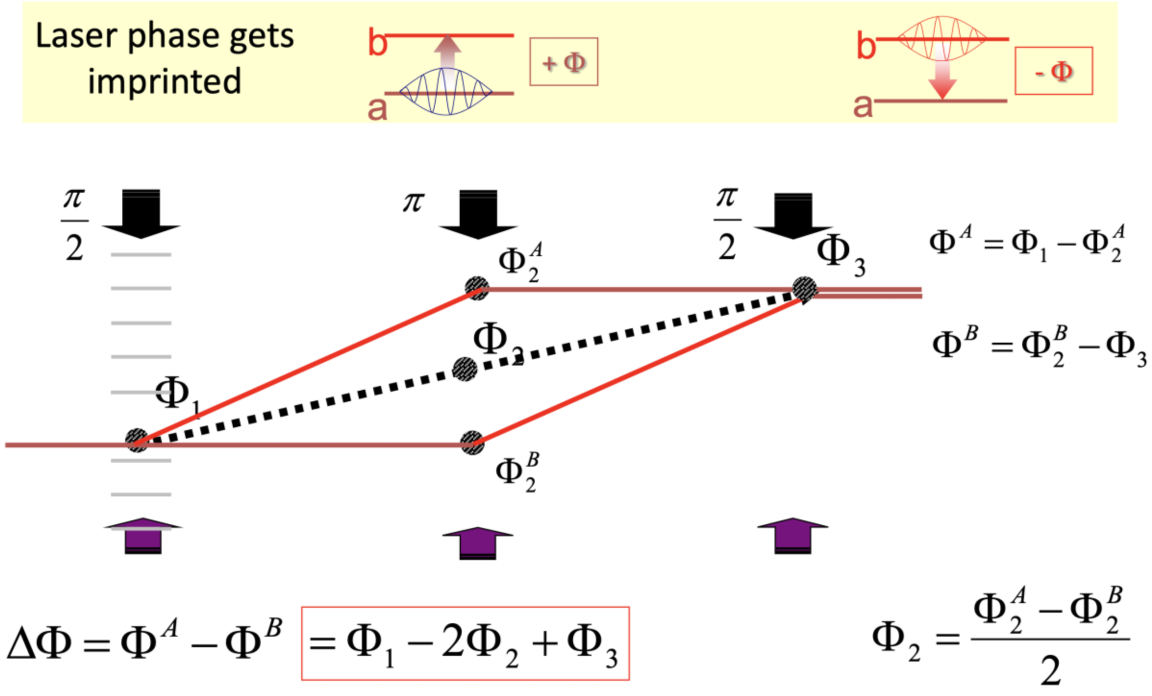
Acceleration phase shift

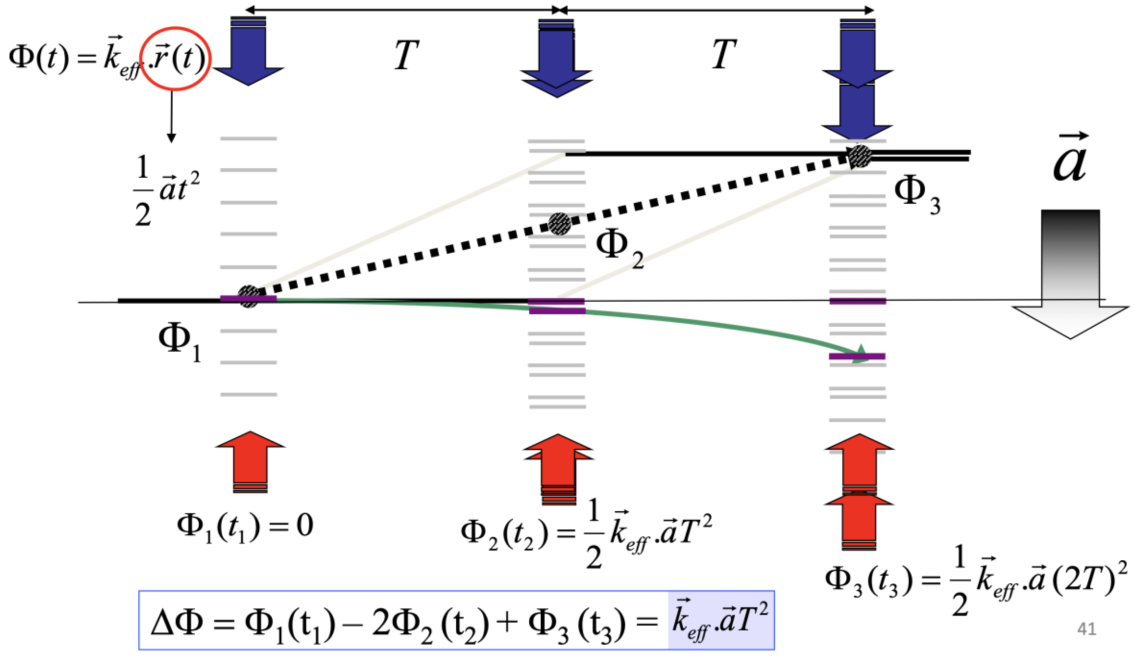


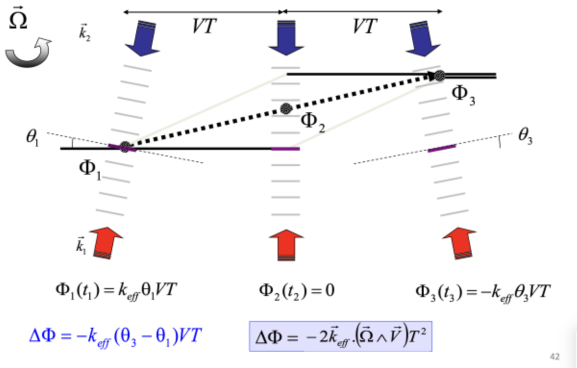
$$\Delta\Phi = \Phi_1(t_1) - 2\Phi_2(t_2) + \Phi_3(t_3) = \vec{k}_{eff}.\vec{a}T^2$$

41

Different Phase Shifts for Different Interactions







$$\Delta\Phi = \Phi_1^{eff} - 2\Phi_2^{eff} + \Phi_3^{eff}$$

$$\Phi_i^{eff}(t) = \vec{k}_i^{eff}\vec{r}_i(t)$$

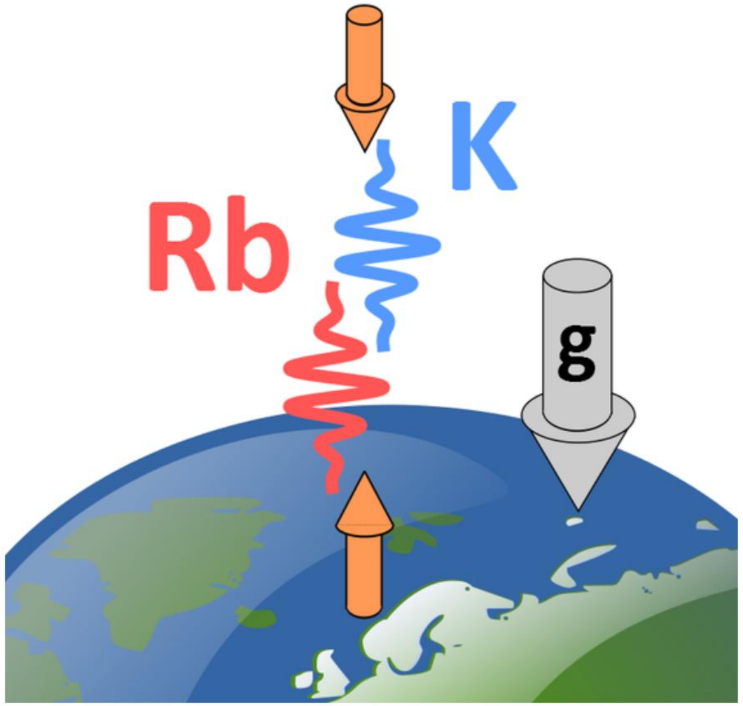
STE-QUEST

STE-QUEST (M-Class Mission Proposal)

STE-QUEST

Space Time Explorer and QUantum Equivalence principle Space Test

A M-class mission proposal in response to the 2022 call in ESA's science program



Core Team:

- Angelo Bassi, Department of Physics, University of Trieste, and INFN - Trieste Section, *Italy*
- Kai Bongs, Midlands Ultracold Atom Research Centre, School of Physics and Astronomy University of Birmingham, *United Kingdom*
- Philippe Bouyer, LP2N, Université Bordeaux, IOGS, CNRS, Talence, *France*

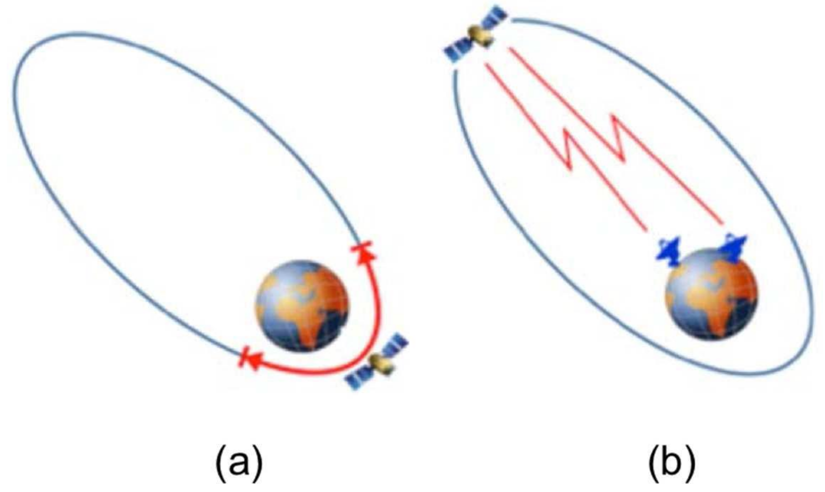
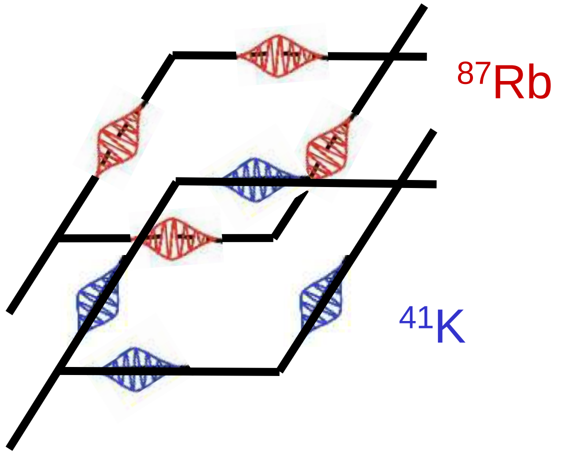
All are also core members of AION

STE-QUEST: An M-class Cold Atom mission to probe gravity, dark matter and quantum mechanics

Science Goals: Equivalent Principal at 1E-17, Ultra-Light Dark Matter, Test of Quantum Mechanics



- Based on STE-QUEST proposals (M3, M4).
- Double atom interferometer with Rb and K “test masses” in non-classical states (quantum superpositions).
- Optimized for UFF test. Assume 700 km circular orbit.
- Apply recent results on controlling gravity gradient shifts by offsetting laser frequencies, thus relaxing atom positioning requirements by factor >100.
- **Reaches 1E-17 target after 18 months of operation.**



Class	Elements	η	Year [ref]	Comments
Classical	Be - Ti	2×10^{-13}	2008	Torsion balance

STE-QUEST Workshop on May 17/18

STE-QUEST: An M-class Cold Atom mission to probe gravity, dark matter and quantum mechanics is now open at:

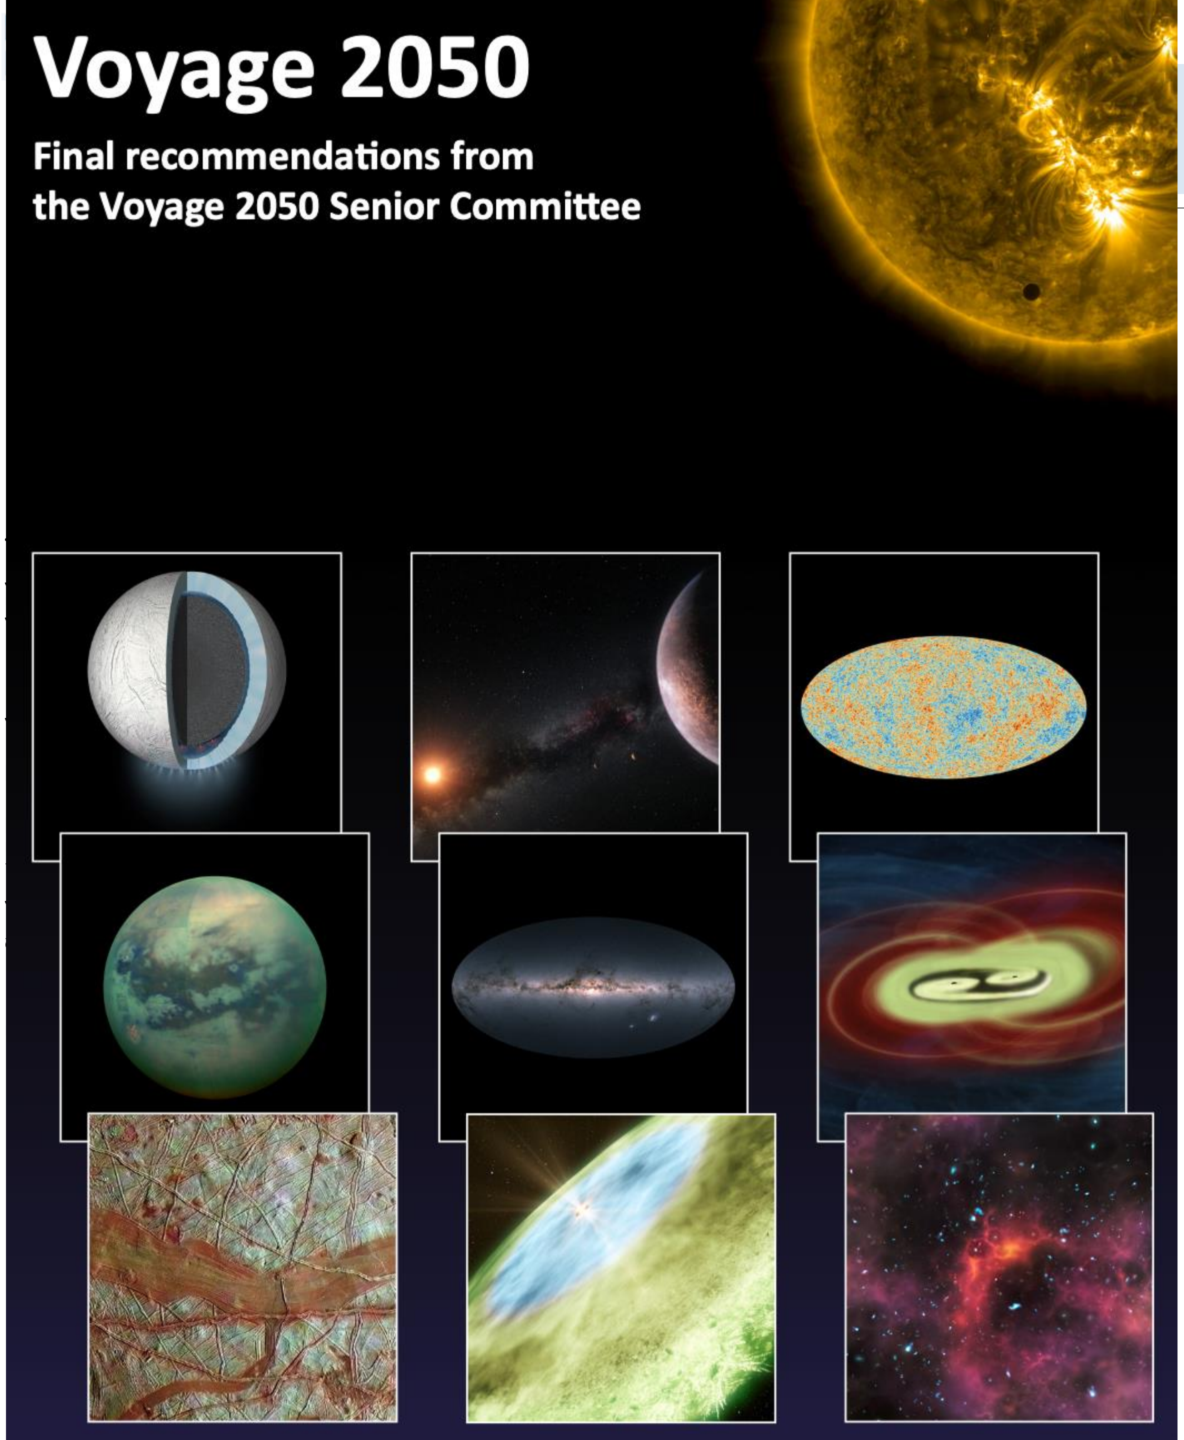
https://indico.cern.ch/event/1138902/registrations/

The workshop will take place as a virtual event on zoom on May 17/18.

https://indico.cern.ch/event/1138902/

- This workshop follows our Community Workshop & Roadmap for Cold Atoms in Space and is the next step in our community building process to define, develop and promote important milestones of our Community Roadmap, specifically the STE-QUEST M-class mission proposal now being considered by ESA.
- This event will bring together the cold atom, astrophysics, cosmology, and fundamental physics communities to discuss the science opportunities of this M-class mission proposal. Further information about the workshop scope is listed below.
- **Registering on the link provided above will enable you to attend the virtual workshop event and to keep informed about the continuing development of a full mission proposal that will follow it.**

ESA SENIOR RECOMMENDATIONS VOYGAE2050



AION

Large missions:

- ➢ Moons of the Giant Planets
- ➢ Exoplanets
- ➢ New Physical Probes of the Early Universe: Fundamental physics and astrophysics

Possible Medium missions:

… QM & GR (cold atoms?)

Technology development recommendations for Cold Atom Interferometry

- for gravitational wave detectors in new wavebands …, detectors for dark matter candidates, sensitive clock tests of general relativity, tests of wave function collapse ….
- must reach high technical readiness level, be superior to classical technologies
- start with atomic clocks, on free-flyer or ISS?

What M-mission to propose?

A coordinated three-fold response of the community to the Voyage 2050 recommendations:

- **A letter to ESA's Director of Science, Guenther Hasinger:**
  - ➢ to raise awareness in ESA that the community is prepared to organise itself and to work actively with ESA, as it shapes a roadmap for a Cold Atom technology in space development programme
- **A community workshop in September:**
  - ➢ This event brought together the cold atom, astrophysics, cosmology, fundamental physics, and earth observation communities to formulate a road-map for the development programme,.
- **A Workshop Summary and Road-map Document**
  - ➢ As input input to ESA and national space agencies on how to structure a Cold atoms in Space programme and what priorities could be established.

CERN AION100 SITE EXPLORATION WITH PBC

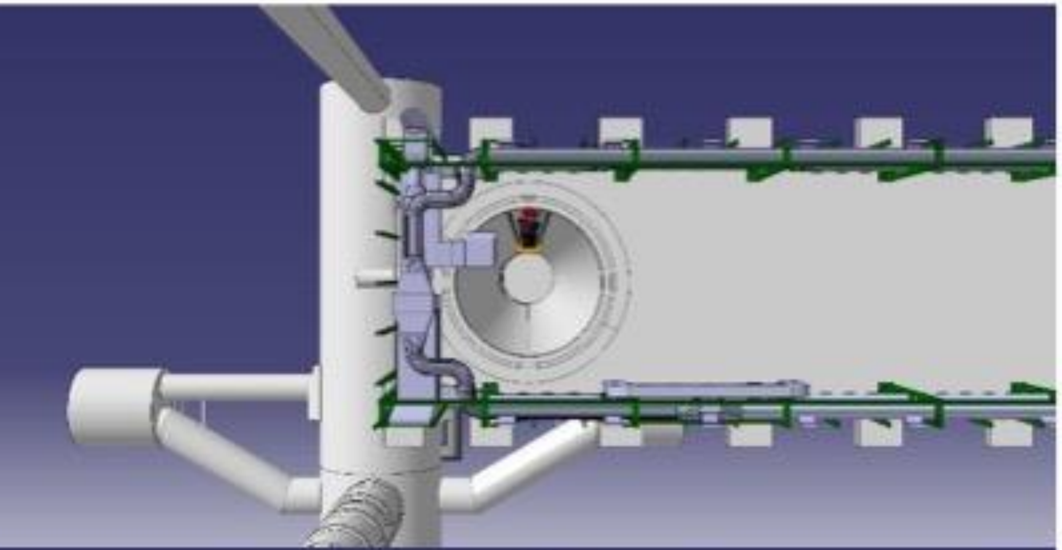
Introduction

EM Noise Levels

Slides from Sergio Calatroni (TE-VSC and PBC)

- **AION-100 experiment is an ion interferometer, proposed to be installed in the PX46 pit**
- **Feasibility study under way, with the support of the Physics Beyond Collider study - Technology Working Group. Aiming for official letter of intent at the end of the year.**
- **For info of other feasibility studies under way for AION-100: https://indi.to/RkZdN**
- **Need to measure EM background noise (1 mHz – 100 kHz) at the top (few meters below the steel lid) and at the bottom of PX46 during machine operation, using fluxgates up to 1-3 kHz, and 3D pick-up coils for the high frequency spectrum**
- **Choice of a closed plastic tube installed in the lid, after drilling, for hosting the probes**
- **Installation procedure approved by LMC: https://edms.cern.ch/document/2710516/1.0**
- **Many thanks to all services and people involved for the support: everybody was fully motivated to help**

AION-100



Location of AION-100

Drilling location

The tube (thanks to EN-MME)

PP plastic, closed at bottom
225 mm outer diameter
199,4 mm inner diameter
5000 mm length
Al flange for support

Installation (thanks to EN-ACE, EN-HE, EN-CV)

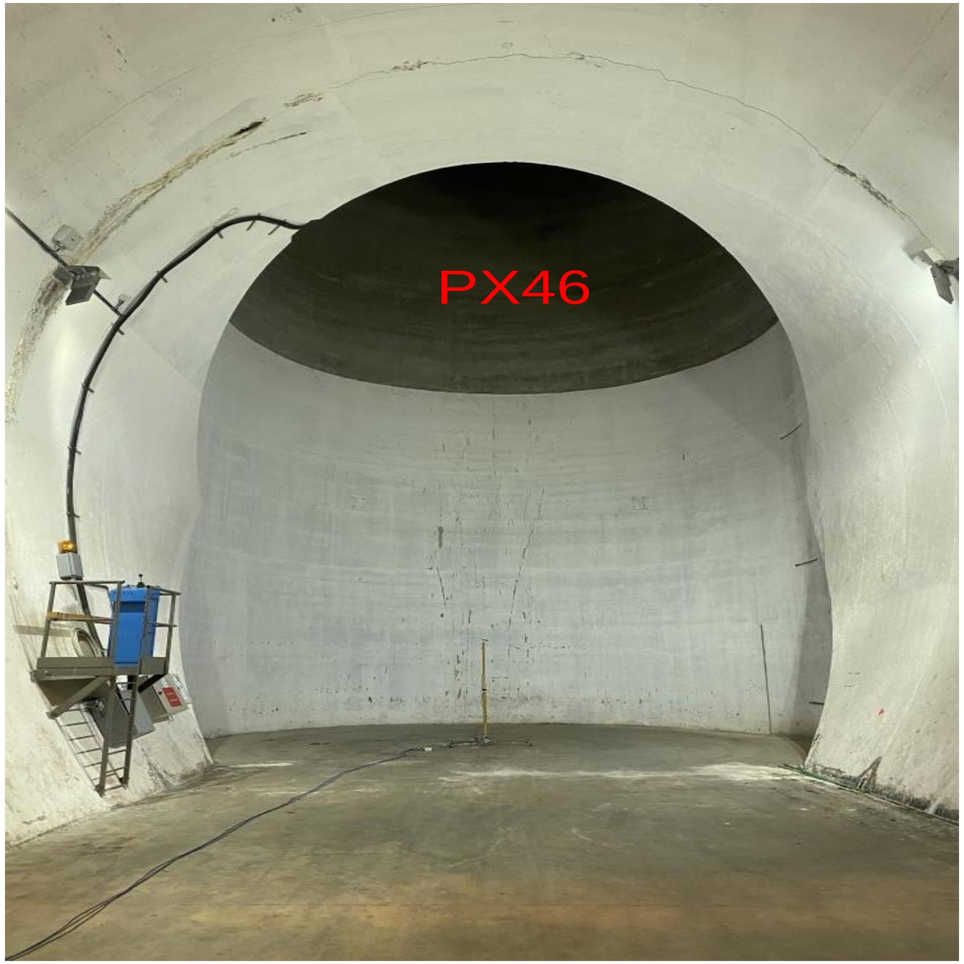
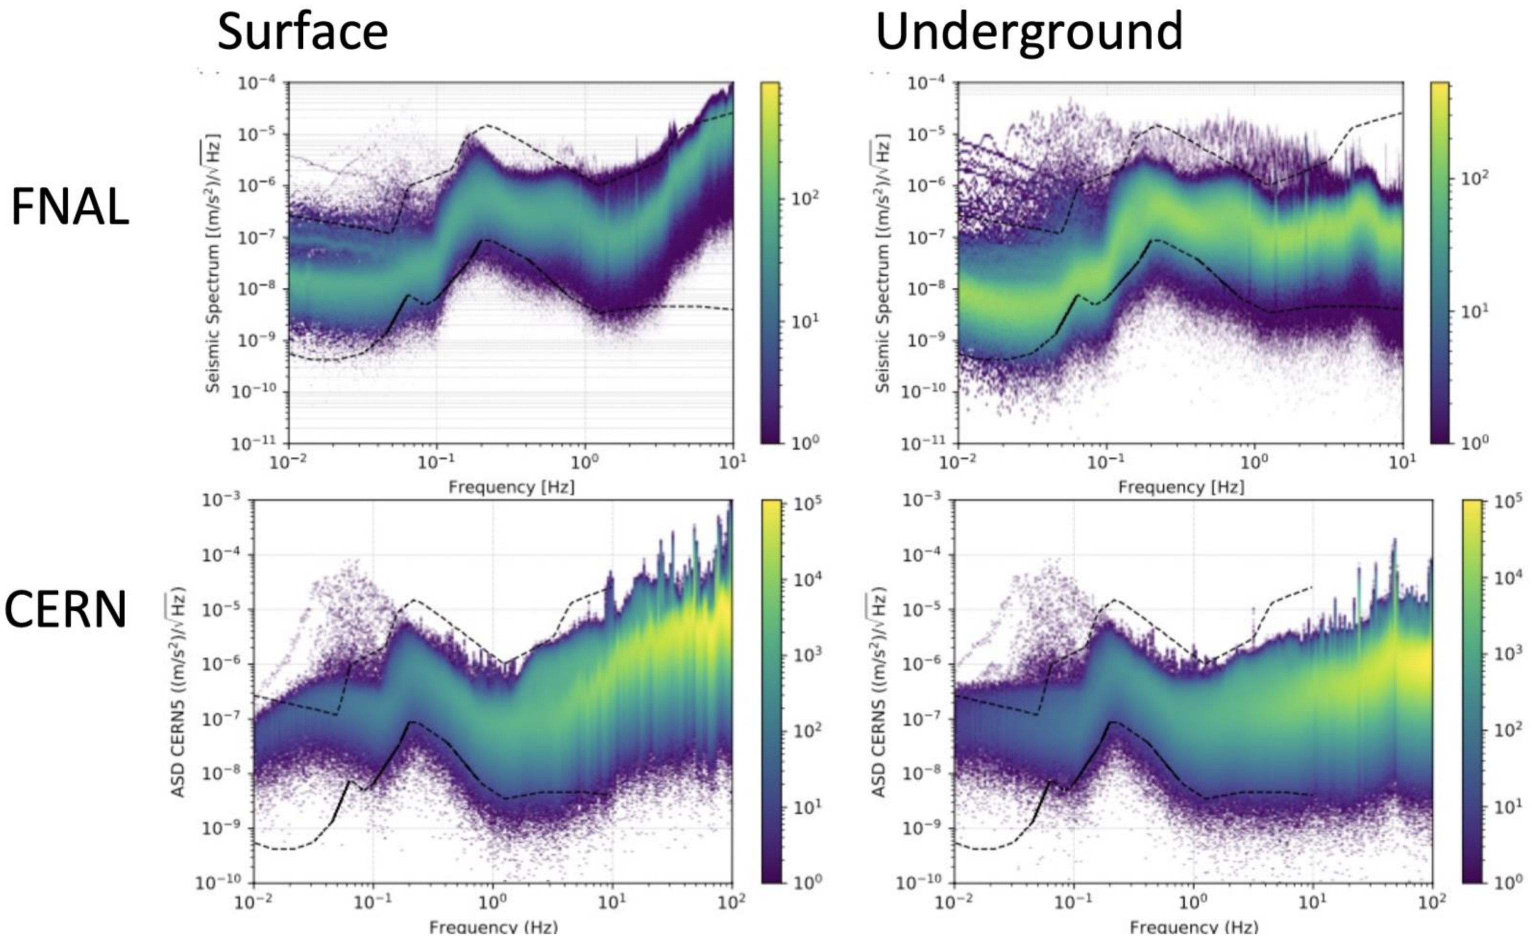
Measurement location at the bottom of the PX46 shaft, UX45 cavern

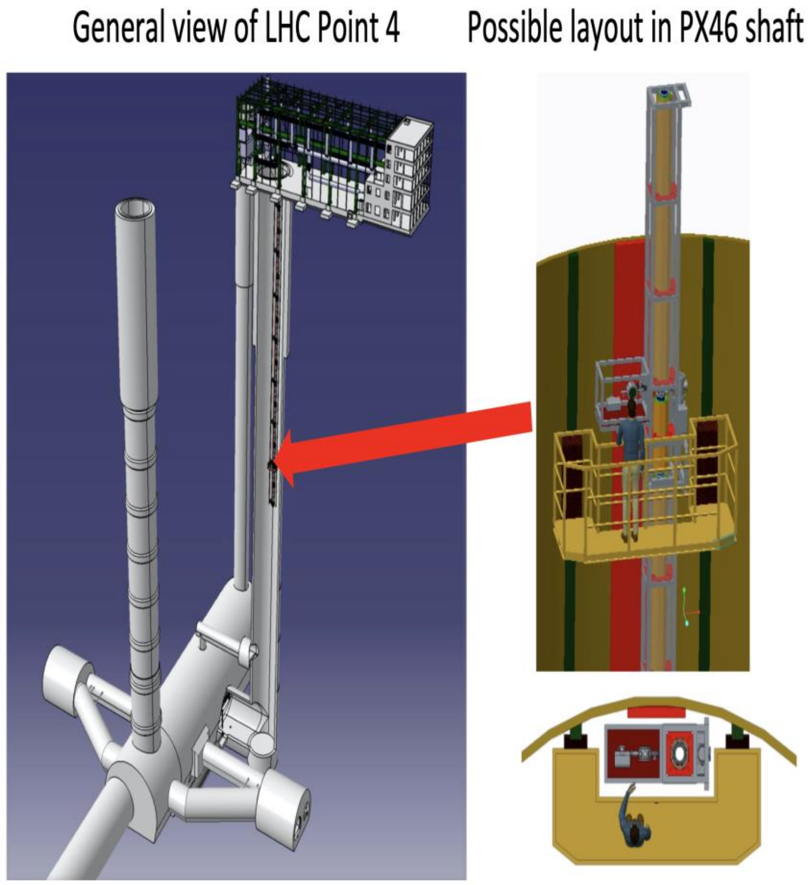


Imperial College London

AION

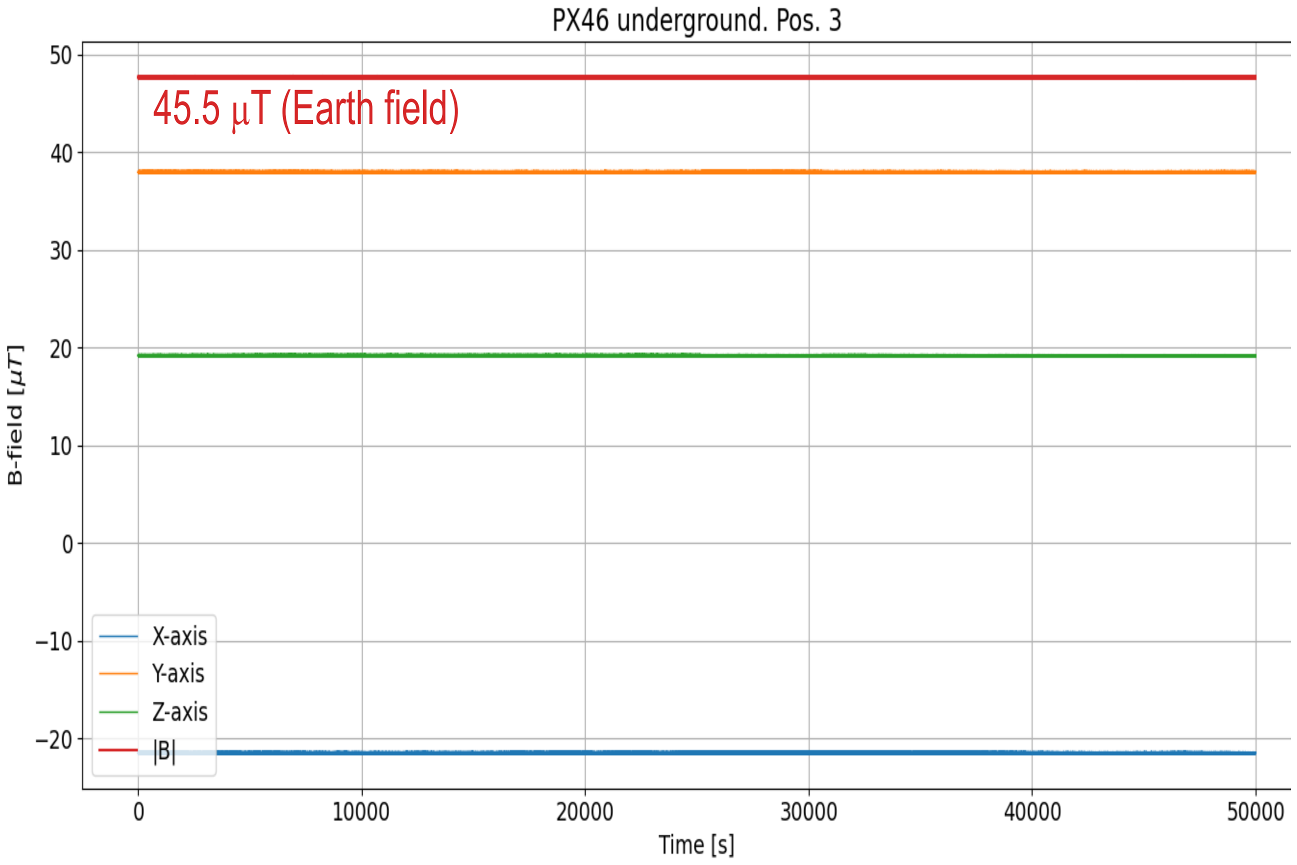
ATION-100 at CERN – Site Investigation





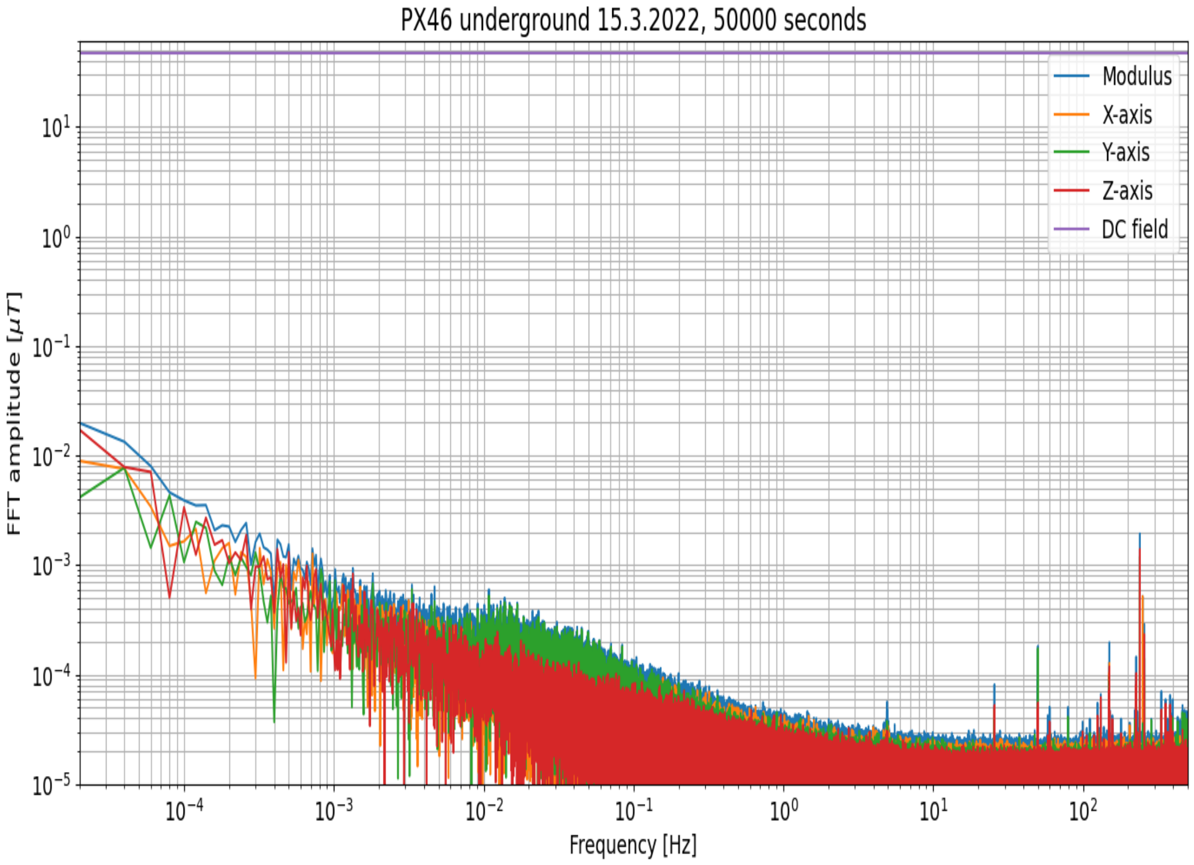
Spectrum similar to that measured at Fermilab for MAGIS

Location: bottom of the PX46 shaft. Systems in UX45 running



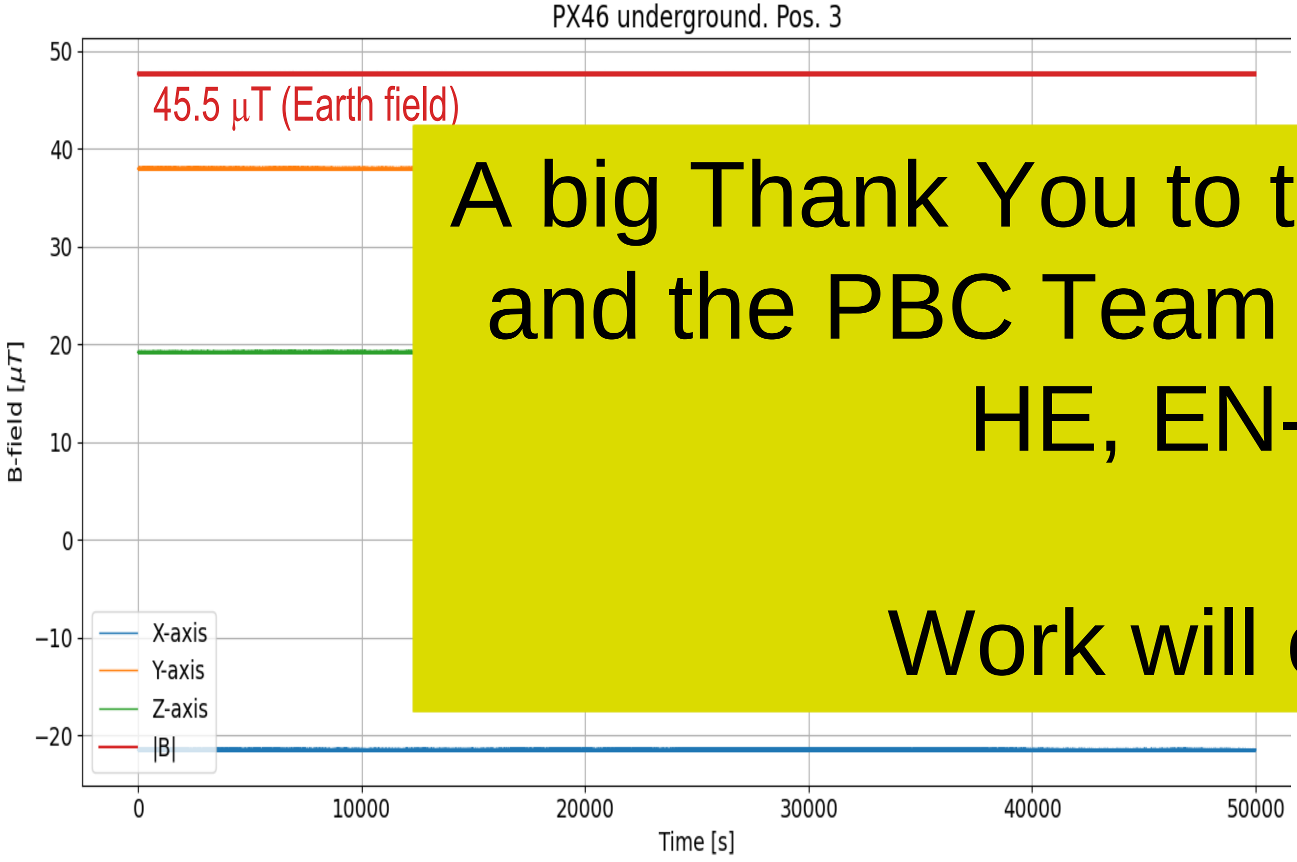
Location 3, wall of PX46. Quiet, Earth field for scale

Location: bottom of the PX46 shaft. Systems in UX45 running



Location 3, wall of PX46. Earth (DC) field for scale

Location: bottom of the PX46 shaft. Systems in UX45 running

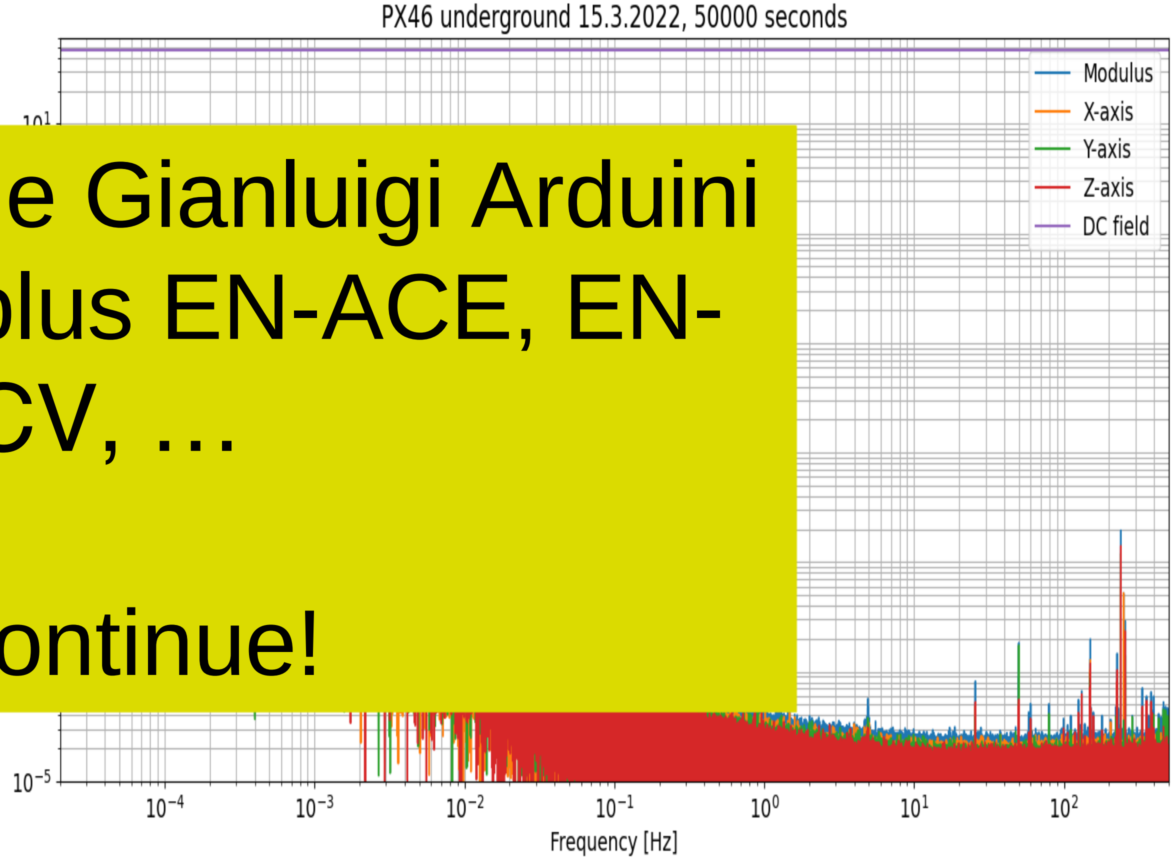


A big Thank You to the Gianluigi Arduini and the PBC Team plus EN-ACE, EN-HE, EN-CV, …

Work will continue!

Location 3, wall of PX46. Quiet, Earth field for scale

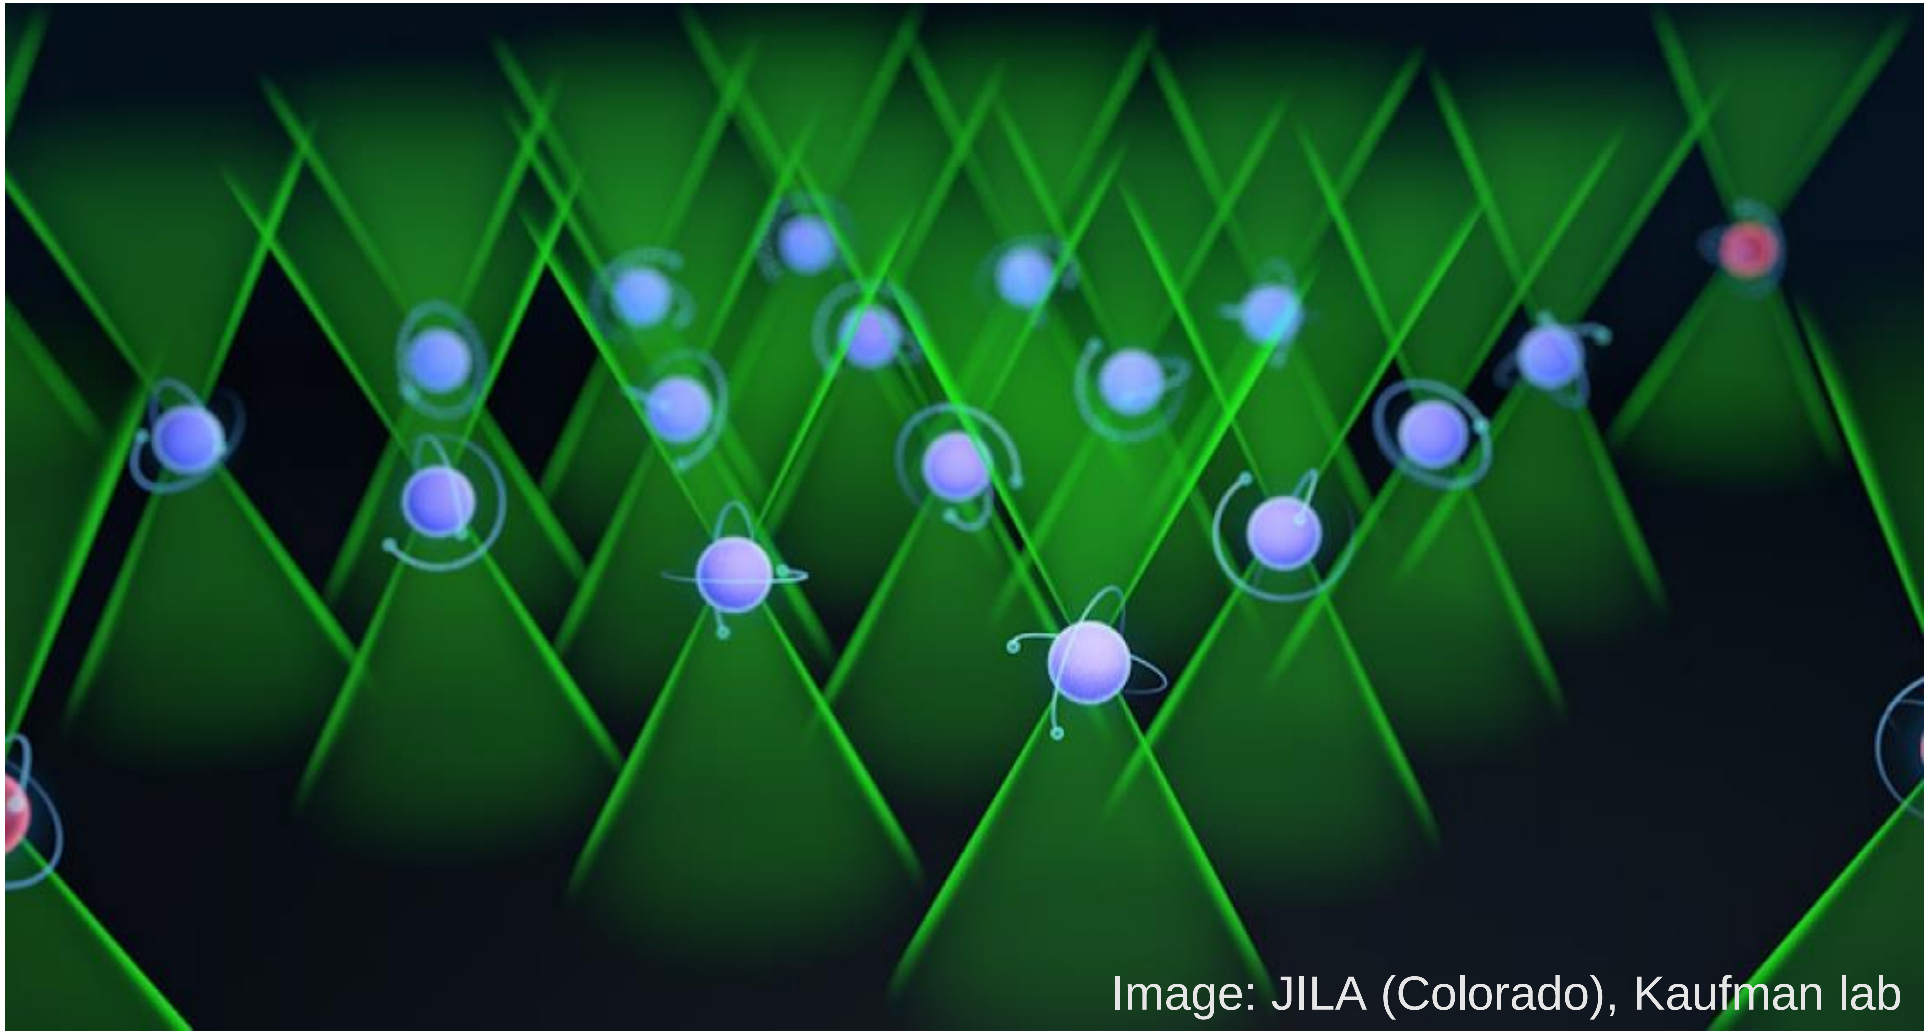
Location: bottom of the PX46 shaft. Systems in UX45 running



Location 3, wall of PX46. Earth (DC) field for scale

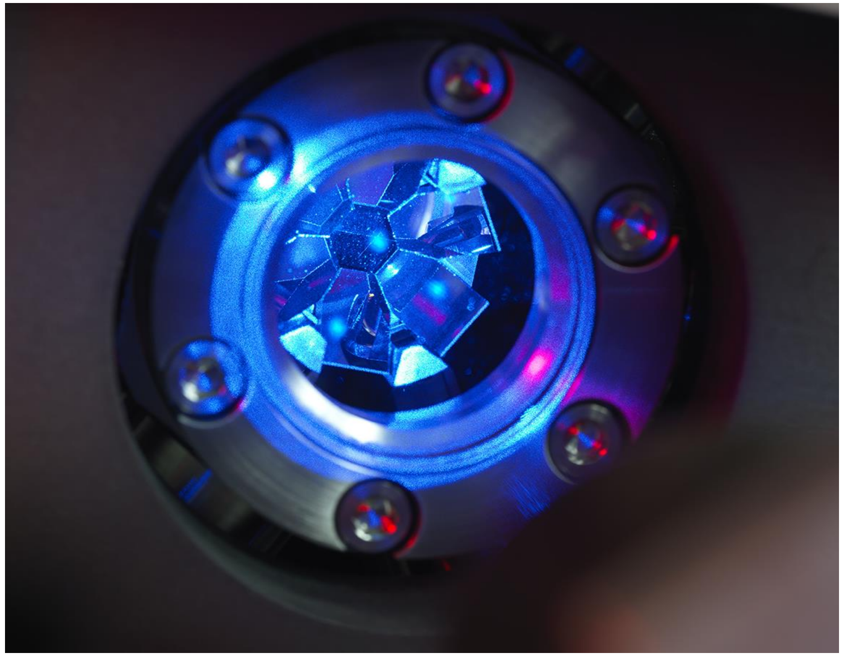
APPLICATIONS IN OTHER FIELDS, SUCH AS QUANTUM COMPUTING.

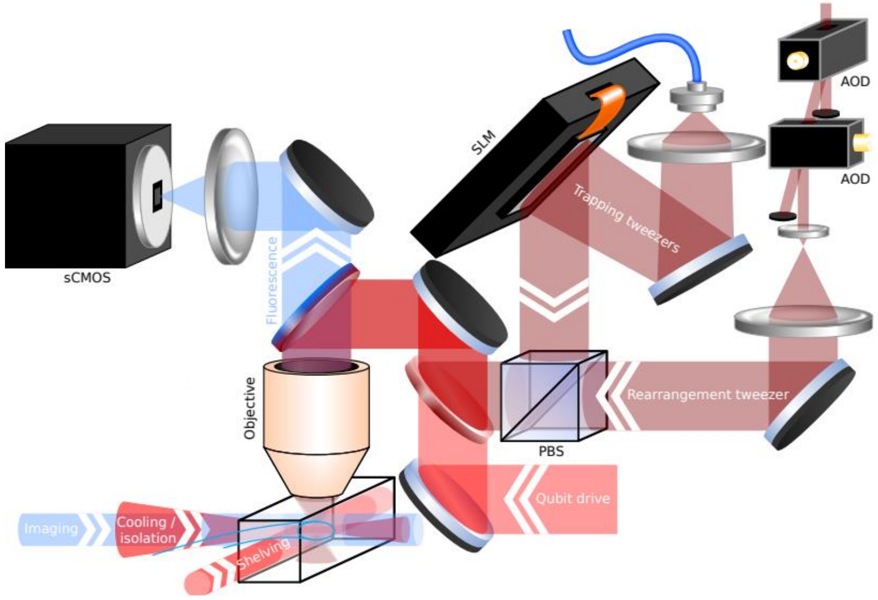
Quantum Computing & AION



Quantum Computing & AION

Existing AION cold Sr system (80%) + New tweezer array (20%) = Quantum computer

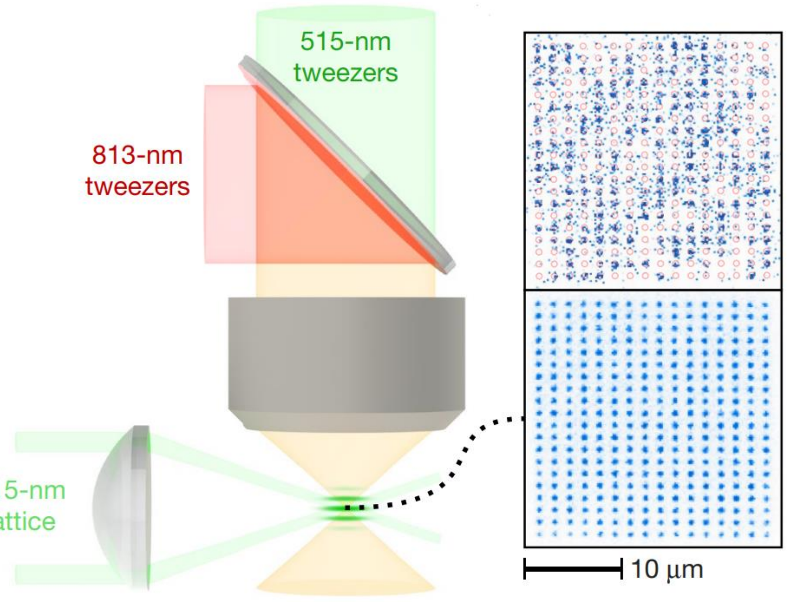




K. Barnes et al, https://arxiv.org/abs/2108.04790 (2021) – Atom Computing

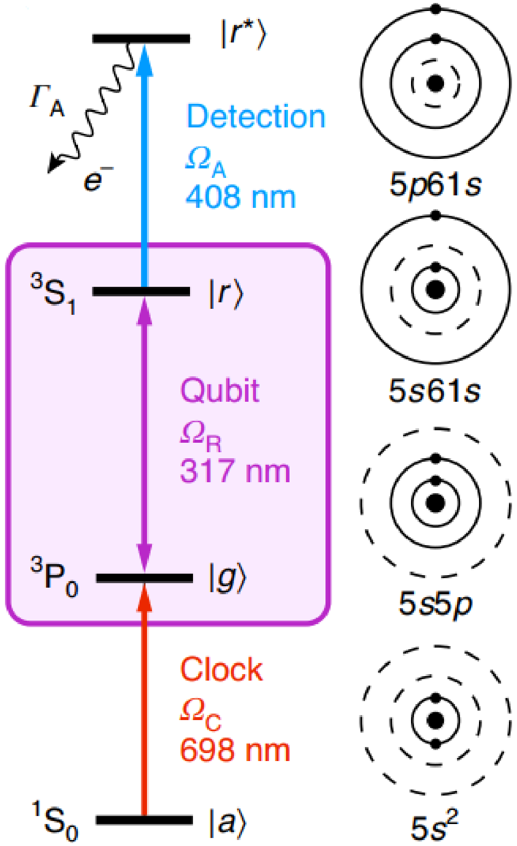
Quantum Computing & AION

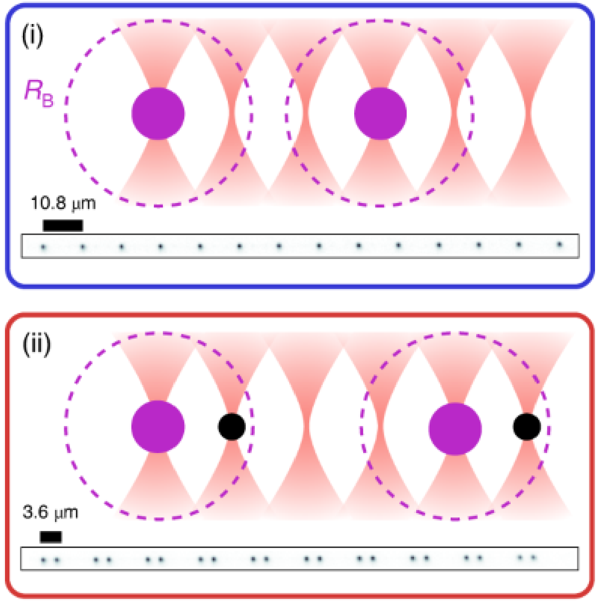
1 qubit = 1 Sr atom



A. W. Young et al, Nature 588, 408-413 (2020)
– JILA Colorado, Kaufman lab

Quantum logic gates (the hard bit!): Rydbergs

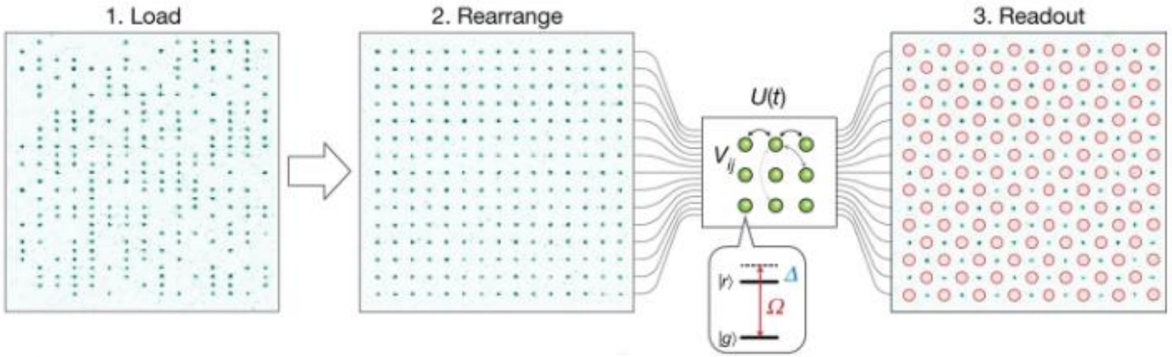




S. Madjarov et al. Nature Physics 16, 857-861 (2020)
– Caltec, Endres lab
99.9(2)% gate fidelity

Quantum Computing & AION

- Trapped-ion or superconducting qubits developed over ~ 20 years
- Tweezer array qubits started to emerge in the last ~ 10 years



Startups in neutral atom computing
https://atom-computing.com/ - $60M funding round, 2022
https://pasqal.io/about
https://coldquanta.com/core-technology/hilbert/
https://www.quera.com/
https://mobile.twitter.com/computingq

Why are we well placed to do this at Imperial?

- Atomic clocks → single qubit operations
- Squeezing → cavities to exchange atom vs photon qubits
- AION → robust, highly engineered Sr systems

Atoms in tweezers – some recent academic results:

S. Ebadi et al, Nature 595, 227-232 (2021) – Harvard, Lukin lab
A. W. Young et al, Nature 588, 408-413 (2020) – JILA, Kaufman lab
S. Madjarov et al. Nature Physics 16, 857-861 (2020) – Caltec, Endres lab
P. Scholl et al, Nature 595, 233-238 (2021) – CNRS, Bronwaes lab

Why Space?

One important argument in favour of Space (vs Earth) is interrogation time T of the atoms in free fall conditions.

To better understand this, it is useful to look at the short-term sensitivity to acceleration of an Atom Interferometer:

$$\delta g = \frac{\delta\phi}{nkT^2} \qquad [\mathrm{m/s^2/\sqrt{Hz}}]$$

where $\delta\phi$ is the atom-phase-resolution of the interferometer, n is the number of Large Momentum Transfer pulses, k is the effective wave-number of the atomic transition and T is the interrogation time between interferometer pulses.

On Earth, many interferometry experiments are limited by their free-fall interrogation times T, achieved through launching or dropping atom clouds at some limited distance above the floor. In space this limitation is removed, leading to potentially large improvements in performance.

Example:
Taking AION-10 goal as reference, we are planning to demonstrate that AION-10 can reach on earth with an interrogation time T ~1s a dg of about 5.7x1E-13 in 2024. In space, we estimate we could reach T~20sec and, thus, reach 3.9x1E-14 (factor ~15 better).

Why Atom Interferometry in Space?

$$\Delta g = \frac{1}{kT^2\sqrt{N}}$$

GRACE reference: ONERA Superstar Accelerometer: 10^{-10} m/s^2

T=100ms N=10^6	T=1s N=10^6	T=10s N=10^6	T=1s N=10^6 100 pulses	T=1s N=10^8 1000 pulses
6 10^{-9} m/s^2	6 10^{-11} m/s^2	**6 10^{-13} m/s^2**	6 10^{-13} m/s^2	3 10^{-14} m/s^2

Large T → large sensitivity

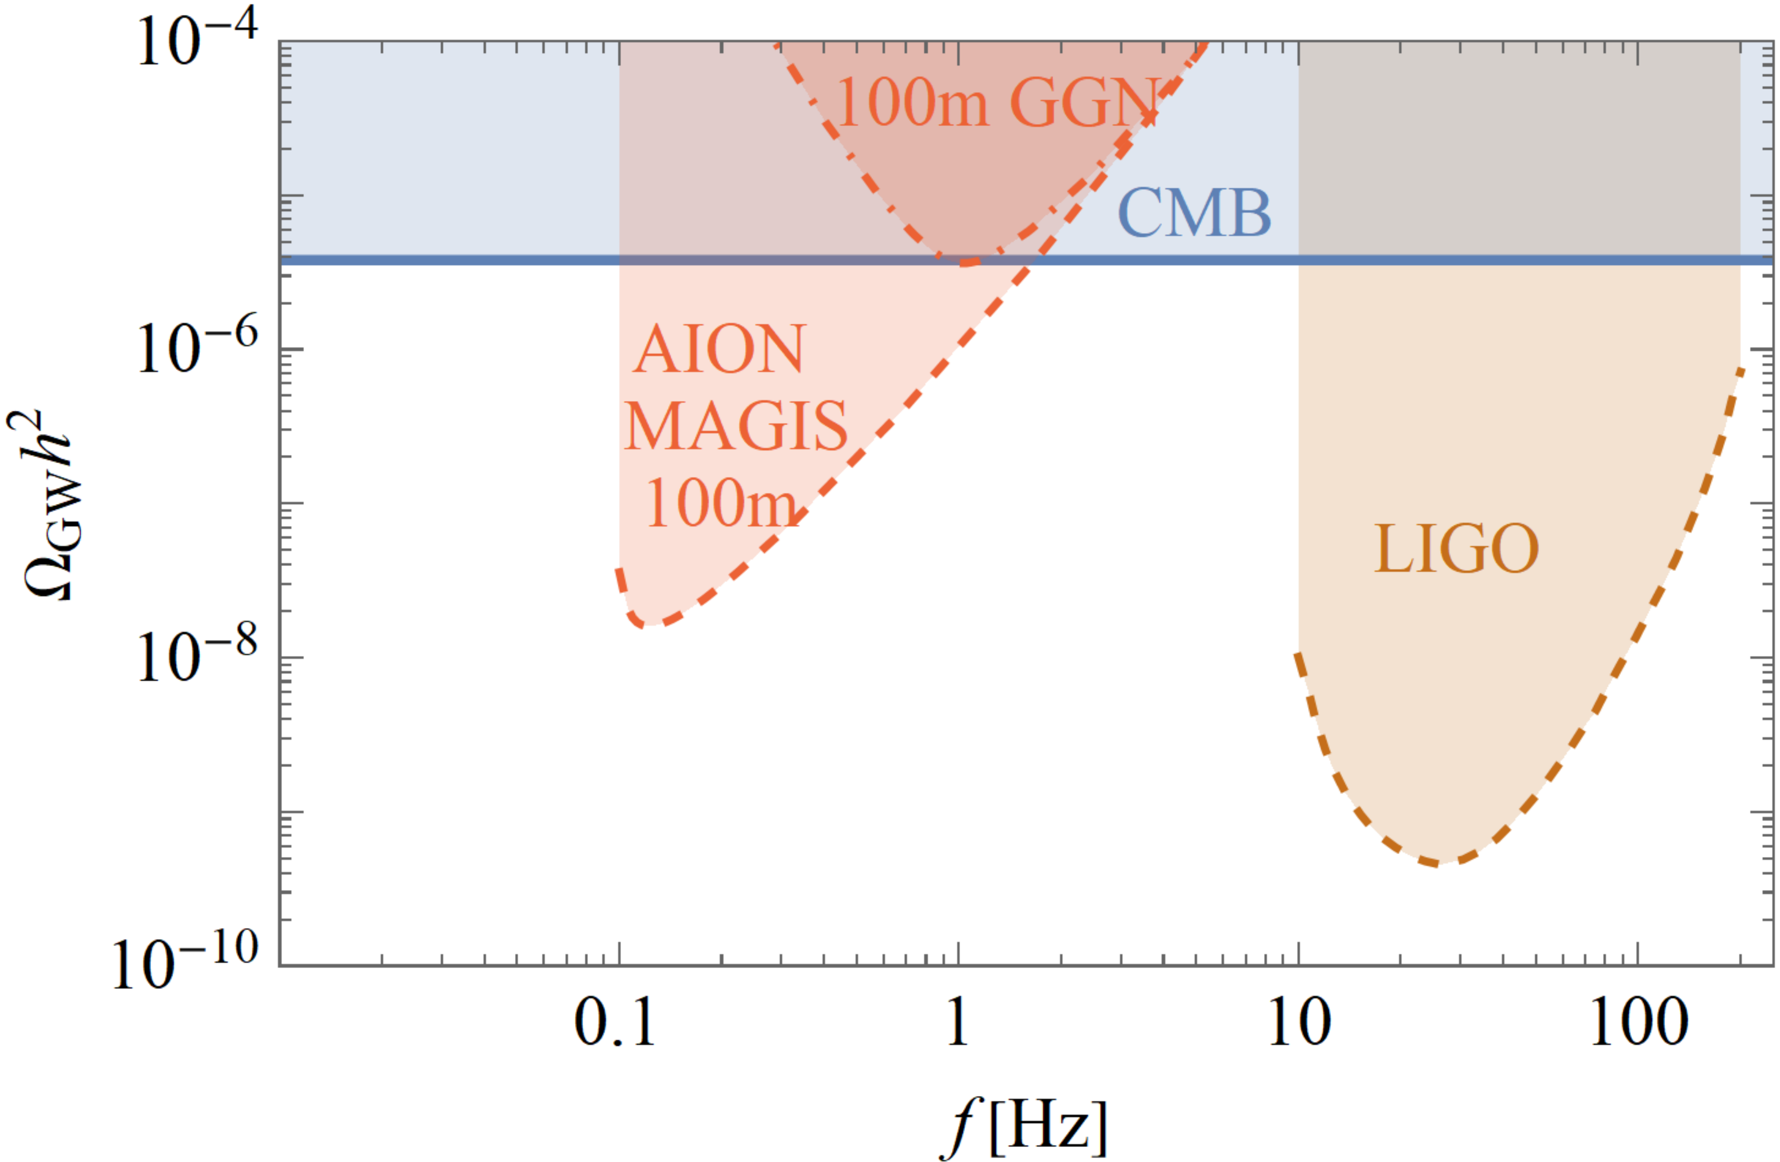
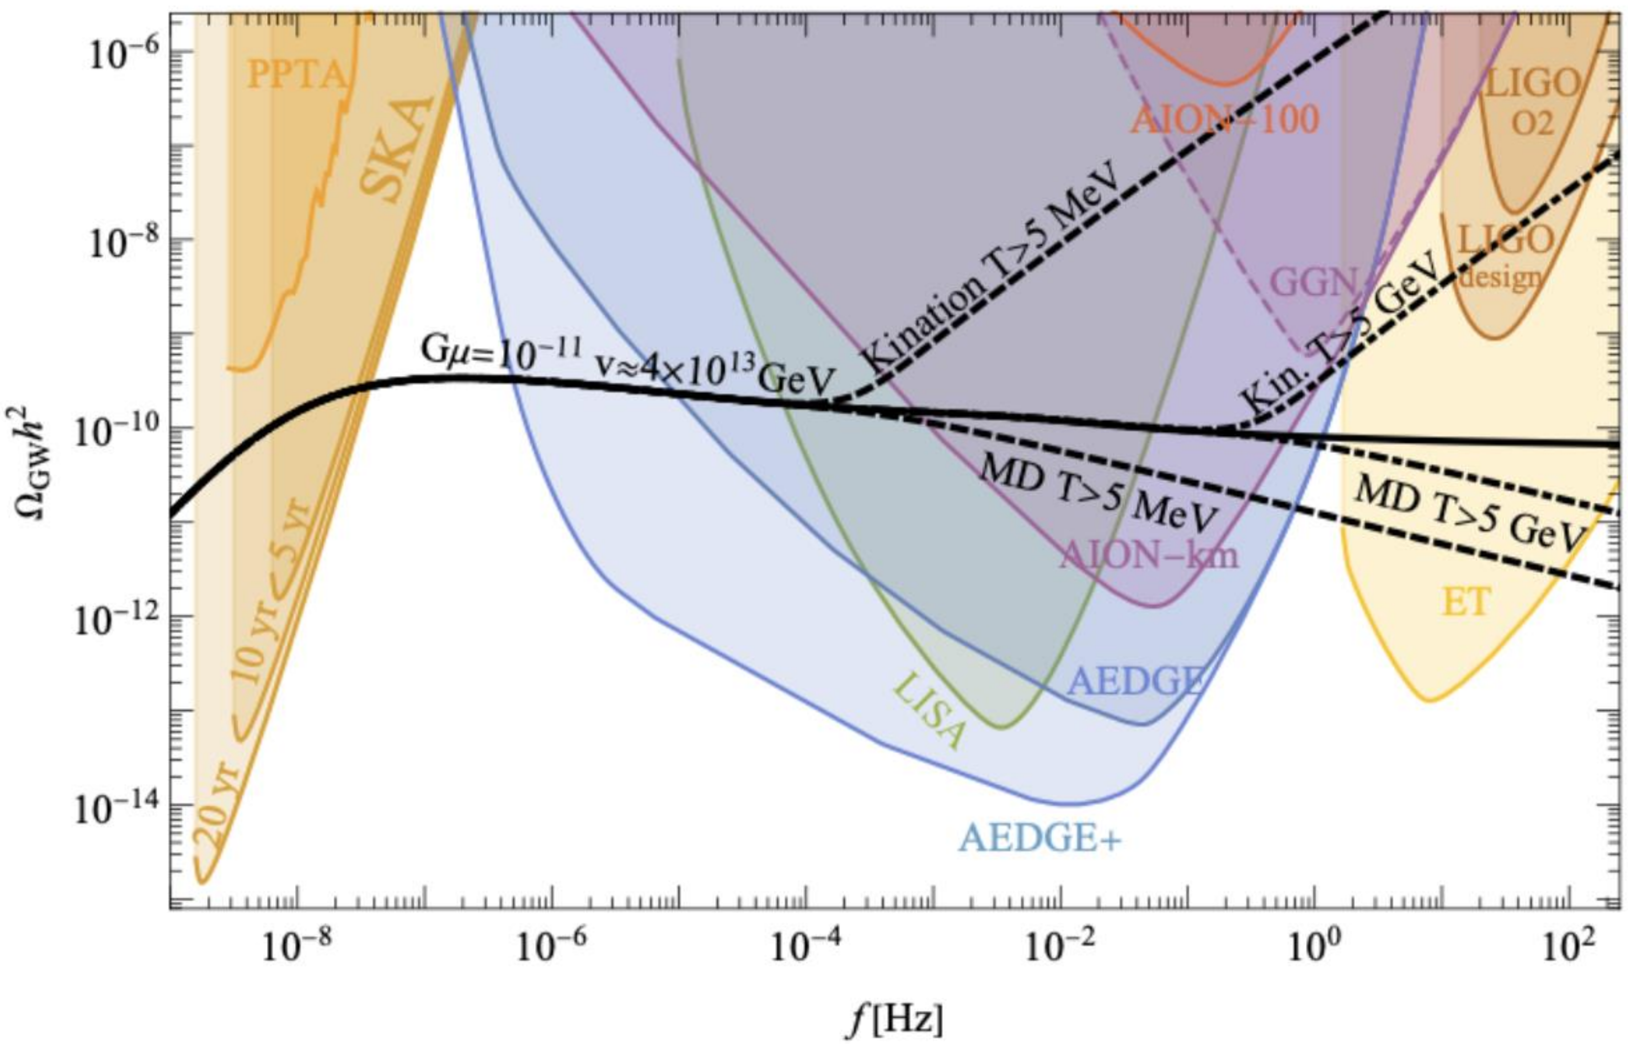
Need to find a solution to fill it

AION Collaboration (Badurina, OB,…, John Ellis et al): arXiv:1911.11755

Badurina, OB, John Ellis, Lewicki, McCabe & Vaskonen: arXiv:2108.02468

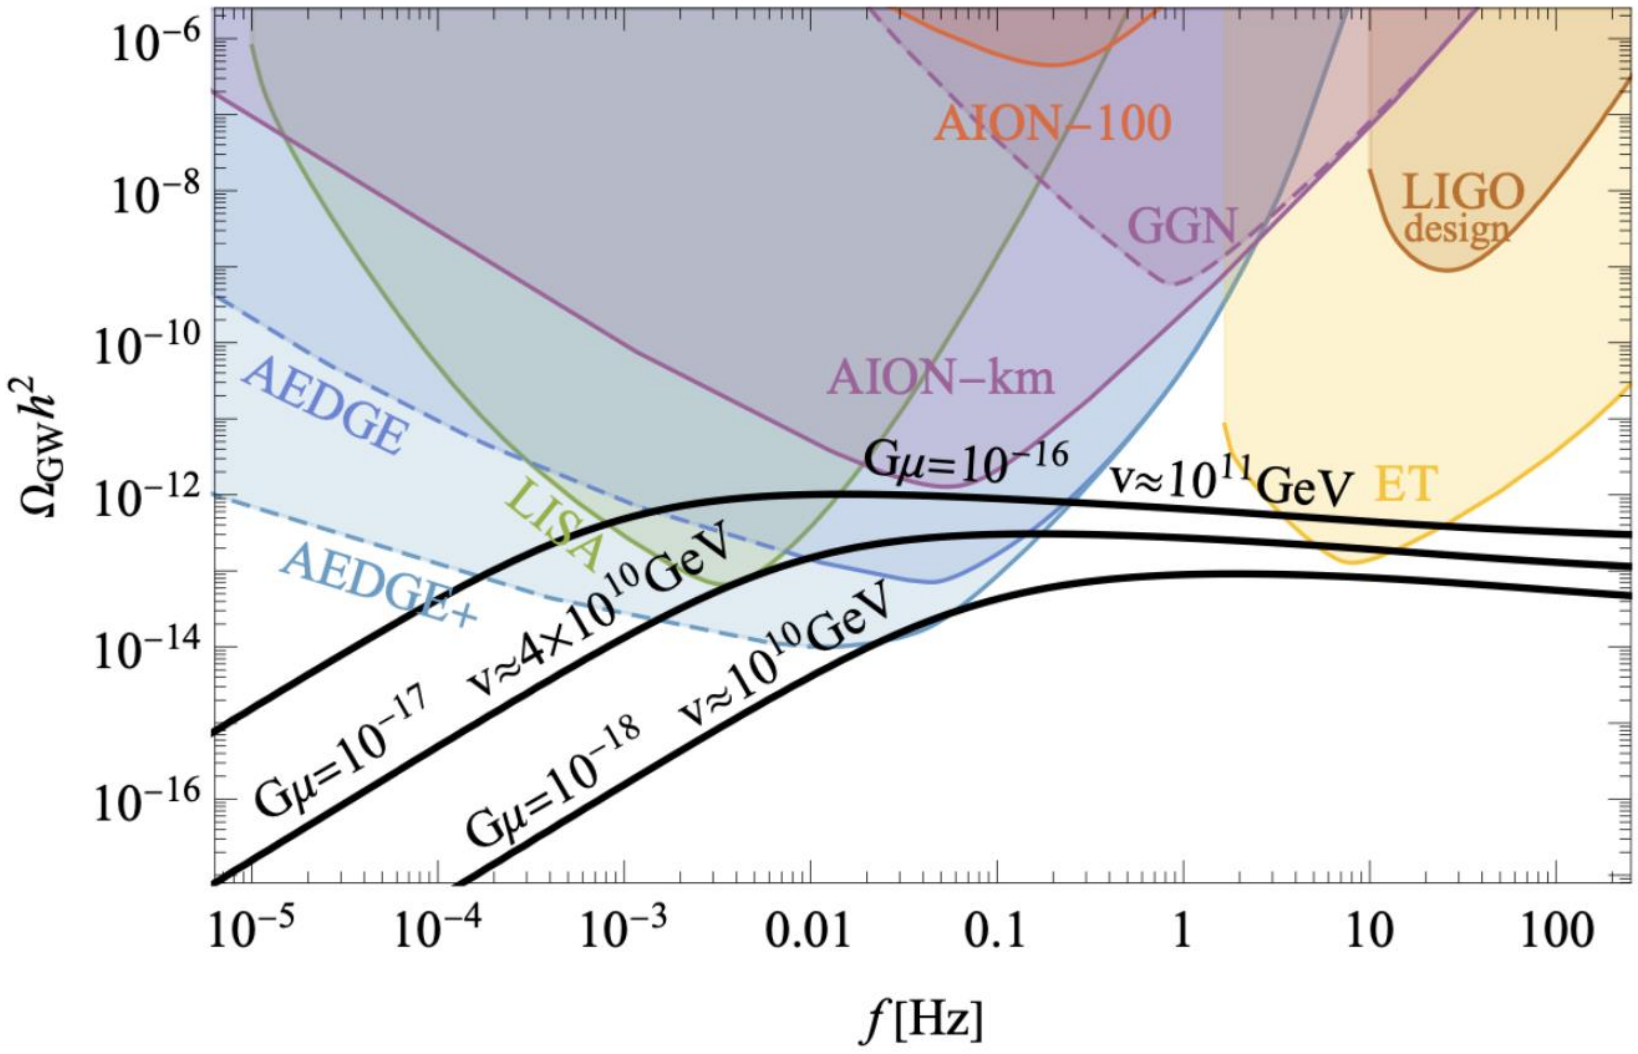
The GW Experimental Landscape: 2030ish





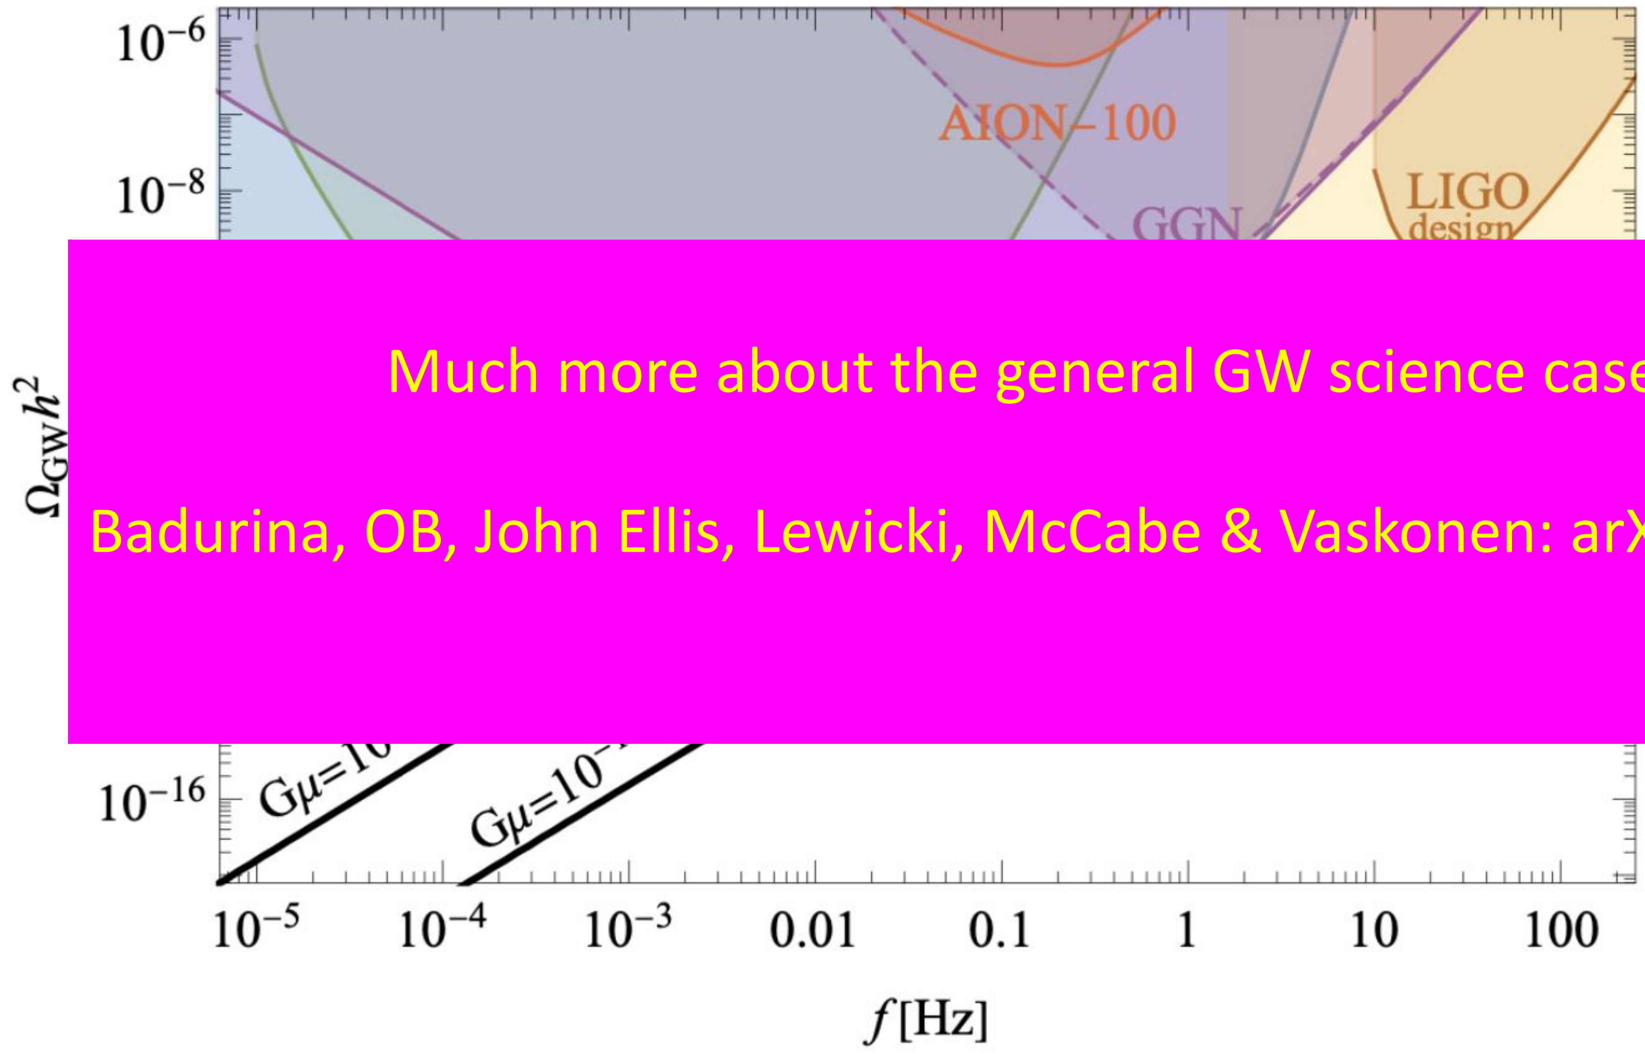
Comparison of the Ω sensitivities to PI spectra of AION-100, AION-km, AEDGE and AEDGE+,
LIGO, ET, Pulsar Timing Arrays (PTAs) and SKA.

Sensitivities of cosmic string measurements to modifications of the cosmological expansion rate. Kination or matter dominance (MD) at temperatures T > 5 *MeV or* 5 *GeV.*



Different experiments sensitive to different values of cosmic string tension

Sensitivities to the cosmic strings with tension Gμ of AION-100 and -km, AEDGE and AEDGE+, LIGO, ET and LISA.



Much more about the general GW science case in:

Badurina, OB, John Ellis, Lewicki, McCabe & Vaskonen: arXiv:2108.02468

Different experiments sensitive
es of cosmic
nsion

Sensitivities to the cosmic strings with tension Gμ of AION-100 and -km, AEDGE and AEDGE+, LIGO, ET and LISA.

Earth Observation Progress

Requirements & Objectives

Threshold requirements

Spatial resolution	Equivalent water height		Geoid	
	Monthly field	Long-term trend	Monthly field	Long-term trend
400 km	5 mm	0.5 mm/yr	50 μm	5 μm/yr
200 km	10 cm	1 cm/yr	0.5 mm	0.05 mm/yr
150 km	50 cm	5 cm/yr	1 mm	0.1 mm/yr
100 km	5 m	0.5 m/yr	10 mm	1 mm/yr

Target objectives

Spatial resolution	Equivalent water height		Geoid	
	Monthly field	Long-term trend	Monthly field	Long-term trend
400 km	0.5 mm	0.05 mm/yr	5 μm	0.5 μm/yr
200 km	1 cm	0.1 cm/yr	0.05 mm	5 μm/yr
150 km	5 cm	0.5 cm/yr	0.1 mm	0.01 mm/yr
100 km	0.5 m	0.05 m/yr	1 mm	0.1 mm/yr

Fundamental Physics Part

Tests of Weak Equivalence Principle (Universality of Free Fall)

Class	Elements	η	Year [ref]	Comments
Classical	Be - Ti	2×10^{-13}	2008 [200]	Torsion balance
	Pt - Ti	1×10^{-14}	2017 [179]	MICROSCOPE first results
	Pt - Ti	(10^{-15})	2019+	MICROSCOPE full data
Hybrid	^{133}Cs - CC	7×10^{-9}	2001 [204]	Atom Interferometry
	^{87}Rb - CC	7×10^{-9}	2010 [205]	and macroscopic corner cube
Quantum	^{39}K - ^{87}Rb	5×10^{-7}	2014 [206]	different elements
	^{87}Sr - ^{88}Sr	2×10^{-7}	2014 [207]	same element, fermion vs. boson
	^{85}Rb - ^{87}Rb	3×10^{-8}	2015 [208]	same element, different isotopes
	^{85}Rb - ^{87}Rb	3.8×10^{-12}	2020 [209]	≥ 10 m towers
	^{85}Rb - ^{87}Rb	(10^{-13})	2020+ [210]	
	^{170}Yb - ^{87}Rb	(10^{-13})	2020+ [211]	
	^{41}K - ^{87}Rb	10^{-17}	2035+	STE-QUEST-like mission
Antimatter	$\overline{\mathrm{H}}$ - H	(10^{-2})	2020+ [212]	under construction at CERN
