

# Design of radiation hard thermal interface material for CMS Phase II Inner Tracker

Mentee: Brendan Ricketts (Tuskegee University)

Mentor: Souvik Das (Purdue University)

---

# Overview

1. LHC
2. CMS Detector
3. Phase II Pixel Detector Upgrade
4. Thermal Interface Material (TIM)
5. Progress already Done
6. Simulation of two-size mixture of spheres
7. SAND33 Materials
8. Making SAND33 samples
9. Experimental Apparatus at Purdue
10. Testing SAND33 and Collecting Data
11. Data Analysis of SAND33\_5 samples
12. Data Analysis of SAND33 samples

# Large Hadron Collider

- Hadron – subatomic particle
- Switzerland & France
- Protons collide with each other at 13.6 TeV
- 27 km long

# CMS Detector

## CMS DETECTOR

Total weight : 14,000 tonnes  
Overall diameter : 15.0 m  
Overall length : 28.7 m  
Magnetic field : 3.8 T

STEEL RETURN YOKE  
13,500 tonnes

SILICON TRACKERS  
Pixel (100x150  $\mu\text{m}$ ) - 1m<sup>2</sup> - 66M channels  
Microstrips (80x180  $\mu\text{m}$ ) - 200m<sup>2</sup> - 9.6M channels

SUPERCONDUCTING SOLENOID  
Niobium titanium coil carrying -18,000A

MUON CHAMBERS  
Barrel: 250 Drift Tube, 480 Resistive Plate Chambers  
Endcaps: 540 Cathode Strip, 576 Resistive Plate Chambers

PRESHOWER  
Silicon strips - 16m<sup>2</sup> - 137,000 channels

FORWARD CALORIMETER  
Steel + Quartz fibres - 2,000 Channels

CRYSTAL  
ELECTROMAGNETIC  
CALORIMETER (ECAL)  
~76,000 scintillating PbWO<sub>4</sub> crystals

HADRON CALORIMETER (HCAL)  
Brass + Plastic scintillator ~7,000 channels

The CMS Detectors is an complex apparatus with layers of sub-detectors

# Phase II Pixel Detector Upgrade

Cross section of  
Inner tracker

The CMS Phase II Pixel Detector made up of silicon detectors will emit 60 kW of heat

# Thermal Interface Material (TIM)

Exploded Dee

Materials that heat encounters

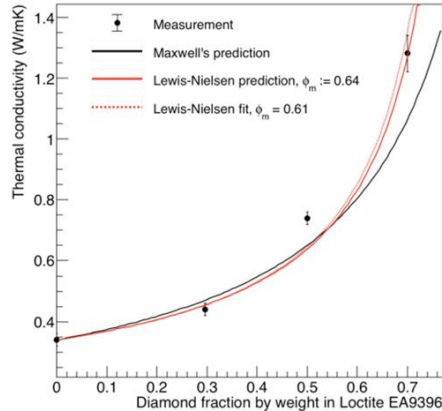

**TIM adhesive is an important step in heat extraction to Stay away from thermal Runaway. We Want to see if we can make it better with a bimodal distribution of diamond!**

# Progress already Done

- Loctite EA9396 also survives radiation according to CERN's maxrad database
- It has low viscosity and is used for aerospace applications

Material	Thermal Conductivity	Thermal Conductivity after 1.5 Grad
Loctite EA9396	$0.34 \pm 0.02$ W/mK	
Loctite EA9396 + 30% 20 um	$0.44 \pm 0.02$ W/mK	
Loctite EA9396 + 50% 20 um	$0.74 \pm 0.02$ W/mK	
Loctite EA9396 + 70% 20 um	<b><math>1.28 \pm 0.06</math> W/mK</b>	<b><math>1.14 \pm 0.09</math> W/mK</b>

# Simulation of two-size mixture of spheres

2D random loose packing

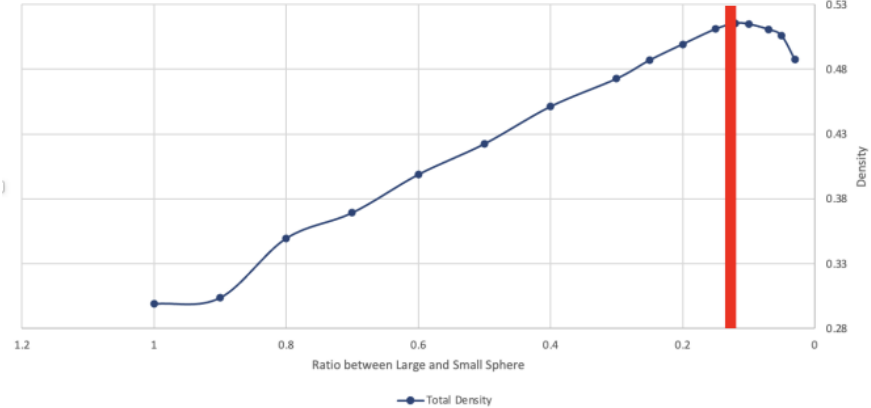

3D random loose packing

Georgia Nissen,  
REU student

- Georgia Nissen and Souvik found through computer simulations that random loose packing of spheres maximizes when radius of small sphere is  $\sim 12\%$  the radius of the large sphere
- Therefore, I began preparing such samples for experimental measurements of thermal conductivity

R	Radius(S)	Radius(L)	Num(S)	Num(L)	Density(S)	Density(L)	Density(T)	Change

Density v Ratio of 0.05 Large Sphere - Seed 1

Maximum Packing Fraction achieved at radius ratio of 12%

# SAND33 Materials

LOCTITE EA 9396 AERO Part A and B

Synthetic Diamond Powder Left 2.4 um  
right is 20 um

# Making SAND33 samples Pt 1

Me mixing Part A and Part B of the Resin

Me Mixing the Resin with the 2.4 and 20 um Diamonds

# Making SAND33 Samples Pt 2

Result of Mixing the all of the Materials

Me putting the Newly made glue in between two sapphire dics to test the samples

The Finished Samples

# Experimental Apparatus at Purdue

Spring clamp to ensure equal pressure at thermal interfaces

Resistive heating element

Six equidistant thermistors placed at the center of copper rods and sealed with thermal grease to create two flux-meters

Test material

Hygrometer

Peltier element

Copper cooling block

Circulating chiller water

Silica gel

Humidity mitigating box to prevent condensation

How do we **mitigate convective and radiative losses** from the sample?

- Ensure heat flow entering sample is equal to heat flow exiting sample. Requires tweaking heater voltage and Peltier voltage with realtime estimation of the fluxes
  - Residual difference of  $\sim 5\%$  is one of the dominant uncertainties

How do we **eliminate contact conductance** from our measurements?

- By carrying out four or more independent measurements with varying sample thicknesses
- By using the same amount of thermal grease between sample and flux-meters across all measurements
- By using the same force across all measurements

# Testing SAND33 and Collecting Data

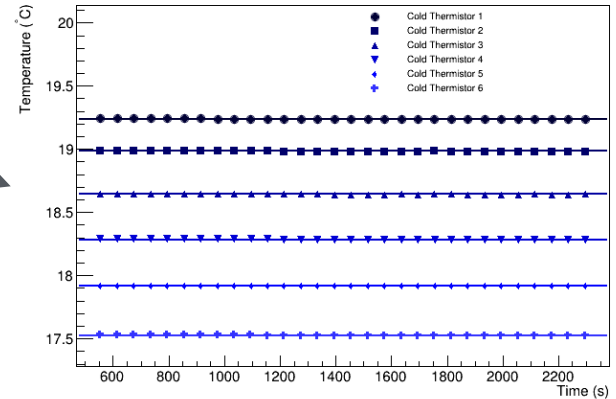

SAND33\_3 being tested in Apparatus

We are trying to get the slope of the hot and cold curves as even as possible

# Data Analysis of SAND33\_5 samples Pt 1

Temperatures measured at the flux meters for SAND33\_5.  
Graphs to the right is an expanded graph of the stable window

SAND33\_5 has a thickness of  $253 \pm 10$  um of material

# Data Analysis of SAND33\_5 samples Pt 2

Gradient of temperature in hot flux meter

Gradient of temperature in cold flux meter

Heat flow through sample,  $I = 9.6 \pm 0.3$  W

Temperature difference across the sample,  $\Delta T = 5.0 \pm 0.1$  C

Therefore, thermal resistance of the sample,  $R = \Delta T/I = 0.52 \pm 0.02$  K/W

# Data Analysis of SAND33 samples

Inferred thermal conductivity  $k = 1.06 \pm 0.10$  W/mK

**No appreciable improvement detected. More careful studies may be needed!**

Thank you for listening!!!
