Action

$$S = \int_{\mathcal{M}} f^3 \left(-\frac{1}{2} \mathcal{R}_4 + \frac{1}{2} \phi'^2 + V(\phi) \right) - \int_{\partial\mathcal{M}} f|_{\partial\mathcal{M}}^3 (\mathcal{K}_4 - T_4)$$

ϕ : Volume modulus, only dynamical field

Einstein frame metric

$$dr^2 + f(r)^2 d\Omega_3^2$$

Solutions to the equations of motion ($V = 0$)

$$\phi(f) = \phi_0 - \frac{\sqrt{6}}{2} \operatorname{arcsinh} \left(\frac{C}{\sqrt{6}f^2} \right)$$

Tunneling exponent on-shell

$$B = \pm \frac{2\pi^2}{\sqrt{6}} |C|$$

Deficit-angle

$$1 - \frac{\theta}{2\pi} = \frac{dR(x)}{dx} \Big|_{x=0} = \left(\frac{\sqrt{6}}{32} \right)^{1/2} \frac{R_{KK}^6}{\eta^2} \frac{1}{\sqrt{C}}$$

Critical bubble radius

$$\rho_0 = \frac{R_{KK}}{4 \left(1 - \frac{\theta}{2\pi}\right)} \left(\frac{R_{KK}}{\eta} \right)^3$$

Tunneling exponent on-shell

$$B = \frac{\pi^2 M_P^2 R_{KK}^2}{16 \left(1 - \frac{\theta}{2\pi}\right)^2} \left(\frac{R_{KK}}{\eta} \right)^4$$

Conclusions

- ▶ Explicit construction of an ETW brane for type IIB CY orientifold compactifications with $O3$ planes
- ▶ Expect a bubble of something solution for vacua with (at most) weakly broken SUSY
- ▶ Bubbles of nothing may be possible for stronger SUSY breaking in the bulk
- ▶ Generically: Expect a bubble of nothing or bubble of something
- ▶ Mechanism of effectively computing the decay/nucleation rate
