# Positron-Emission Tomography (PET)

**PET is used on:**

- **Humans by doctors for disease diagnosis (a typical dose is 8 mSv)**

- **On small animals by pharmaceutical companies for drug design (a typical dose is ~ Gy)**

**The concept of emission and transmission tomography was introduced by David E. Kuhl, Luke Chapman and Roy Edwards in the late 1950s.**

A good PET description:

- ❖ G. Muehllehner, J.S. Karp, *Phys. Med. Biol.* **51** (2006) R117-R137
- ❖ T.K Lewellen, *Phys. Med. Biol.* **53** (2008) R287-R317

# PET tracers

Usually cyclotrons are used to generate commonly used PET isotopes

Commonly used tracers:

- water
- ammonia
- glucose and glucose analogues
- oxygen

FDG (fluorodeoxyglucose), as a glucose analogue, is taken up by high-glucose-using cells such as brain, kidney, and cancer cells.

# PET modalities

- PET (dose ~ 8 mSv)
  - gives only functional/physiological information
  - poor/missing anatomical information
- PET-CT (dose ~ 16 mSv)
  - gives anatomical information
  - helps PET reconstruction
  - but higher dose, due to the X-rays (~ 16 mSv)
- PET-MRI (dose ~ 8 mSv)
  - gives anatomical information
  - soft tissue is visible on MRI
  - MRI gives additional morphological information
  - the dose is the same as in PET
  - but high magnetic field (affects PMTs)

# PET - physical limitations & problems

**“Intrinsic” limitations are:**

- **positron range in the medium**
- **photons non-collinearity**

# PET - physical limitations & problems

Random coincidences

Scattered photons

Parallax error

Time resolution

Energy resolution

Spatial resolution

- ❖ B.J. Pichler, H.F. Wehrl, M.S. Judenhofer, *J. Nucl. Med.* **49/2** (2008) 5-23
- ❖ N.E. Bolus et al., *J. Nucl. Med. Technol.* **37/2** (2009) 63-71

For small animal PET the random coincidence and spatial resolution are the main limitations

# Resistive-Plate Chambers (RPC)

❖ R. Santonico and R. Cardarelli , *Nucl. Instr. Meth.* **A187**, 377-380 (1981)

# RPC-PET

❖ P. Fonte, A. Smirnitski, M.C.S. Williams, *NIM A* **443**, 201-204 (2000)

❖ A. Blanco et al., *Nucl. Instr. Meth.* **A508**, 88-93 (2003)

# RPCs – a journey from fundamental research to applications

# Scintillator-based vs RPC-based PET

- High price
  - Higher sensitivity for scattered photons
  - Energy measurement
  - Parallax error
  - Time resolution  $> 200$  ps
  - Spatial resolution  $\sim 2$ -3 mm
  - PMT, APD, ...
  - FOV 16-25 cm
- Much cheaper
  - Sensitivity decreases with E
  - Practically no parallax error
  - Time resolution  $\sim 30$  ps\* , even 20 ps, Williams et al. Nucl. Instr. Meth. A 594 (2008) 39-43
  - Spatial resolution  $\sim 300$   $\mu$ m
  - No need of PMTs
  - Not affected by magnetic fields
  - Large area  $\rightarrow$  large FOV  $\sim 1$  m
  - Main problem: to increase the efficiency for 511 KeV photons

\*The quoted resolution is for charged particles and is not so good for gammas, but **WHY ?**

- ❖ C. Lippmann et al., Nucl.Instr. Meth. A 602 (2009) 735-739
- ❖ L. Lopez et al., Nucl.Instr. Meth. A 573 (2007) 4-7.
- ❖ A. Blanco et al., Nucl. Instr. Meth. A 508 (2003) 70-74.

# PET ToF

Without ToF:  
 $\Delta Z = \text{LOR} (\sim 70 \text{ cm})$

With ToF:  
 $\Delta Z = C \cdot (t_2 - t_1) / 2$

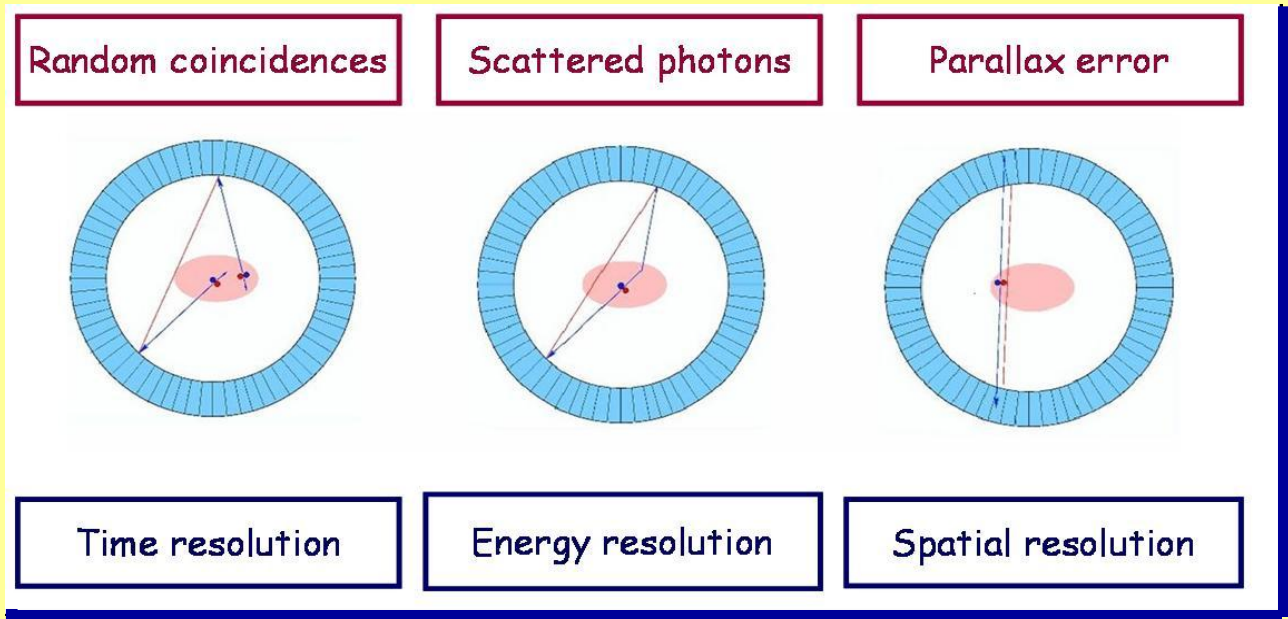

if  $\Delta t \sim 100 \text{ ps} \Rightarrow$   
 $\Delta Z \sim 2 \text{ cm}$

**RPC**

## PET - ToF

- ~20 times lower dose
- faster acquisition (to study the dynamics of the physiological processes)
- no complicated reconstruction
- (almost) no random coincidence
- (partial) Compton suppression by ToF

# RPC PET R&D @ Sofia University

- Two main goals:
  - To increase the efficiency for 511 keV photons
  - To suppress Compton scattered photons
- Photon spectrum simulation (*done*)
- GEANT simulation of different RPC designs (*done*)
- GEANT simulation of multigap RPC (*done*)
- Prototype building and tests (*in progress ...*)

- ❖ N. Ilieva et al., *API Conf. Proc.* **1203**, 820-825, (2010)
- ❖ G. Georgiev et al., RPC2012 proceedings (2012)

# RPC-PET: design & optimization

- ❖ *The simulations are performed, using Geant4 [www.geant4.org/geant4](http://www.geant4.org/geant4)*
  - *Compton scattering, photo-effect*
  - *multiple scattering, ionization, Bremsstrahlung*
- ❖ *Detector „basic unit“:*
  - two glass plates, 2 mm*
  - gas gap 300  $\mu\text{m}$*
- ❖ *Gas composition (for material budget):* 85%  $\text{C}_2\text{H}_2\text{F}_4$  + 5%  $\text{i-C}_4\text{H}_{10}$  + 10%  $\text{SF}_6$
- ❖ *Two designs are considered:*
  - *Gas-Converter (GC)*
  - *Gas-Converter-Insulator (GCI)*

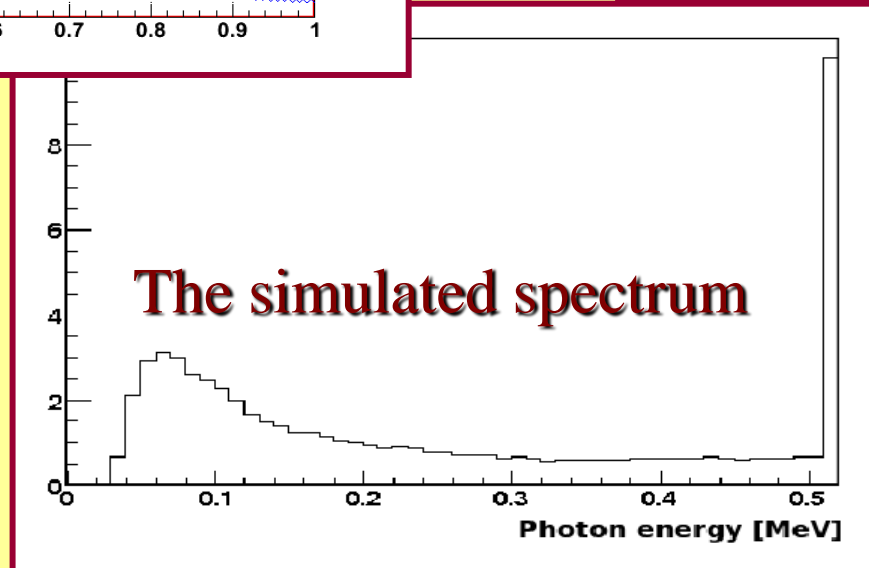

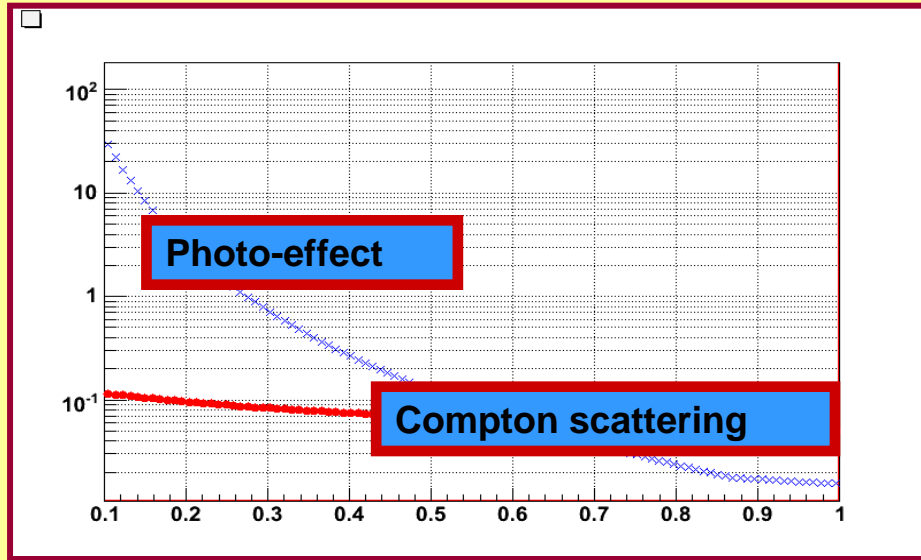

# Photon propagation in the human body

Ca	1.4 %
P	1.1 %
K	0.2 %
S	0.2 %
Na	0.1 %
Cl	0.1 %

## Electron yield in the gas

- Successful photons conversion : at least one interaction within the converter has lead to the ejection of an electron into the gas gap:
  - photon interaction in the converter
  - electron propagation to the gas

$$\frac{dN}{dx} = kN_{\gamma} - sN$$

$$N = a(1 - e^{-x/b})$$

$$N = a(e^{-x/c} - e^{-x/b})$$

$k$  photon interaction coefficient

$N_{\gamma}$  number of photons at  $x$

$s$  electron interaction coefficient

$N$  number of electrons, entering the gas

$C$  photon attenuation coefficient

Thin converter; **a** is max e yield;  
saturation  $\longrightarrow$  95% yield thickness

# Gas - converter design

Maximal electron yield (0.3 ÷ 0.38) %

Signal strips

insulator

Gas gap

gamma

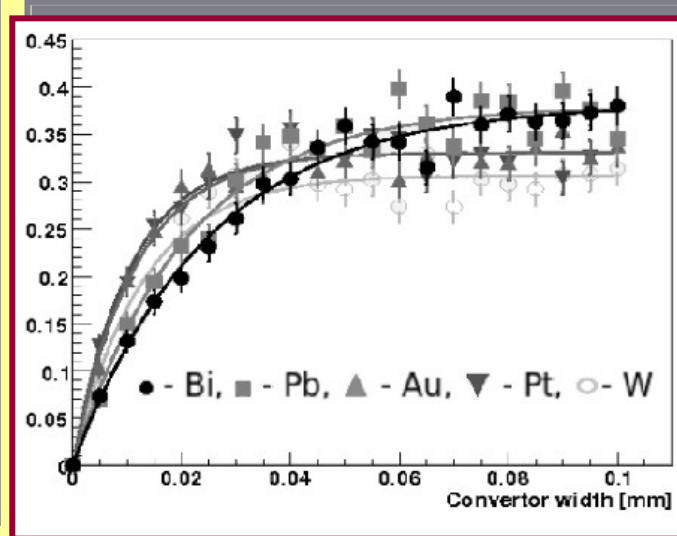

Converter

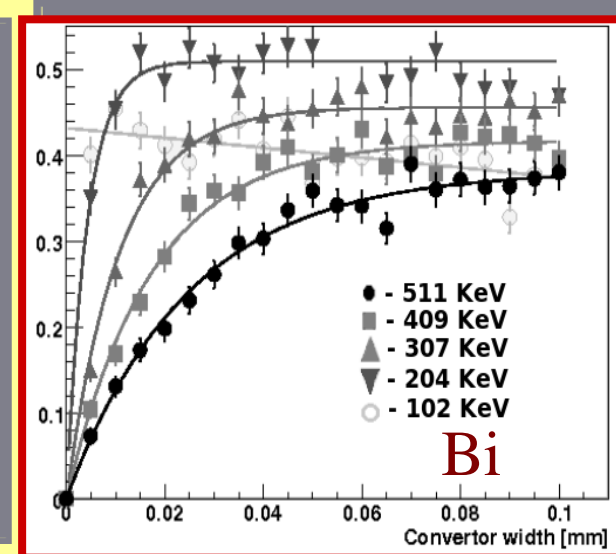

# Gas - converter design

$e^-$  yield for 5 different converter materials (% from the initial photon number)

$e^-$  yield and ejected electrons for 5 different converter materials. (% from the initial photon number)

***BUT*** higher sensitivity for ***scattered*** in the body photons !

# Gas - insulator - converter design

Maximal electron yield for 511 *KeV* photons

$(0.315 \pm 0.005) \%$

~ 0.17% lower than in *GC* design

95% level

$(40.7 \pm 3.0) \mu\text{m}$

Signal strips

Gas gap

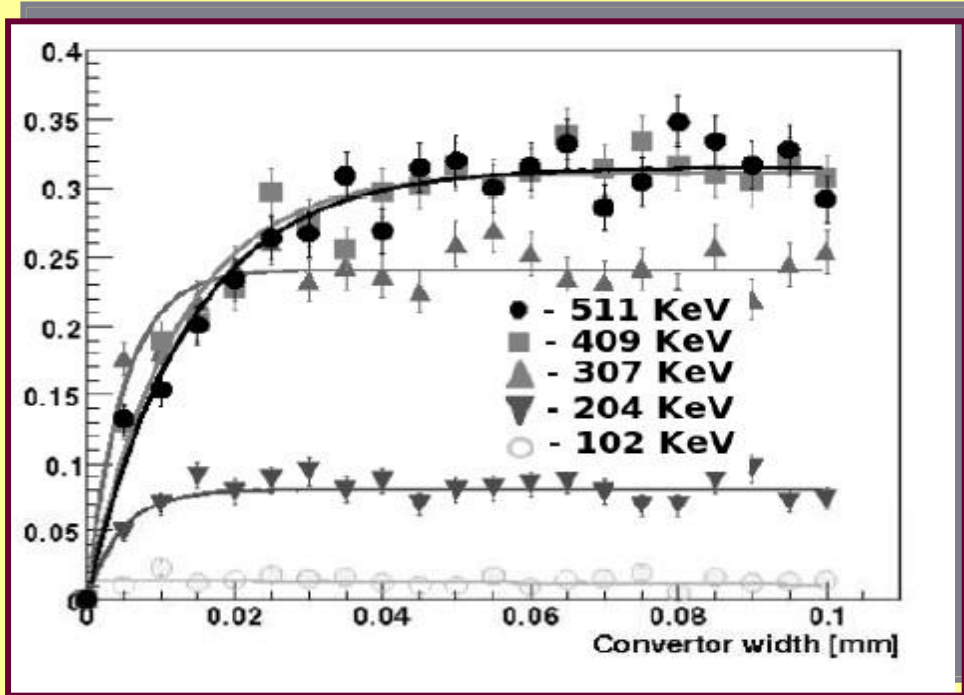

gamma

Converter

# Gas - insulator - converter design

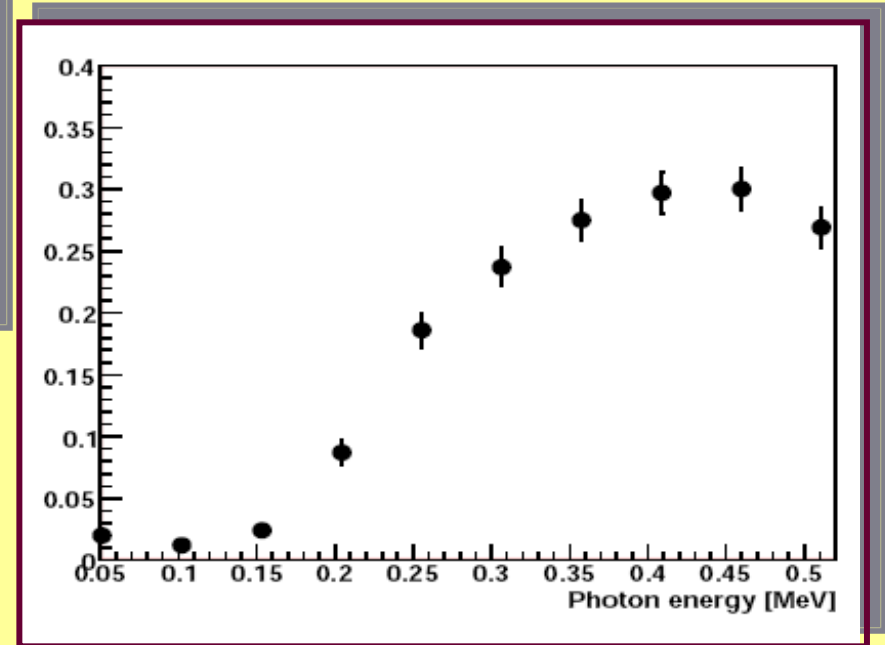

$e^-$  yield / photon energy /  $40 \mu\text{m}$

$e^-$  yield / converter width

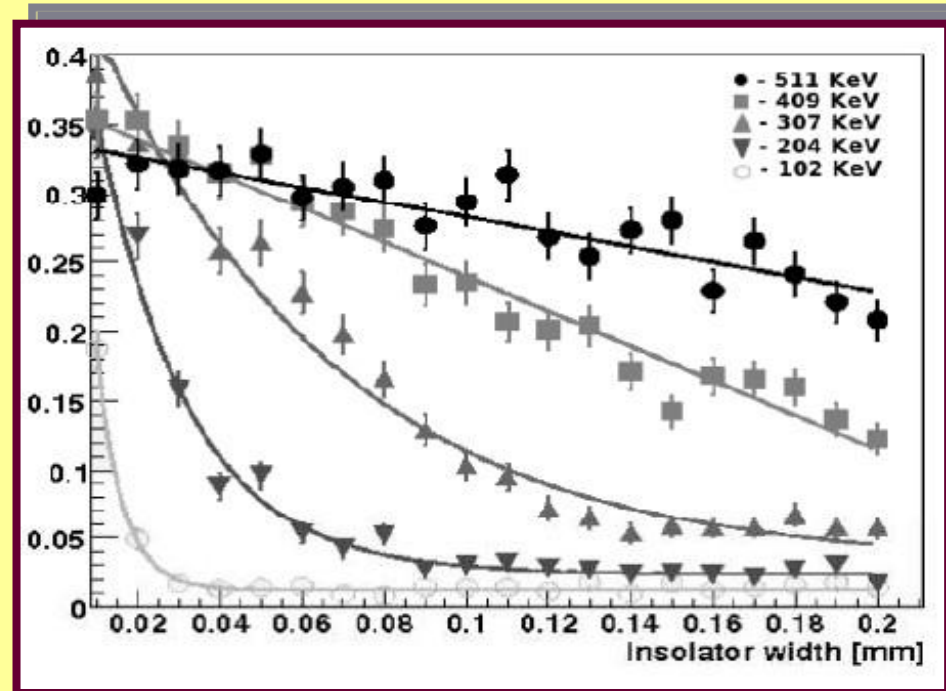

$40 \mu\text{m}$

# Gas - insulator - converter design

$e^-$  yield / insulator width

$100 \div 200 \mu m$

# Gas - insulator - converter design

Insulator 0.05 mm

Insulator 0.1 mm

Insulator 0.15 mm

Insulator 0.2 mm

0.1 mm insulator:

511 KeV -26% reduction

307 KeV -68% reduction

yield ~ 3:1

0.2 mm insulator:

511 KeV -40% reduction

307 KeV -90% reduction

yield ~ 5:1

The reduction is in  
Comparison to GC design.

# Multi-gap GIC design

$$N = \sum_i a_0 e^{-(i-1)x/c} (e^{-x/c} - e^{-x/b})$$

max yield 511 KeV ~ 43%,  
95% level - at  $381 \pm 13$  gaps

- 100 gaps provide sufficient
- amplification
  - lower-energy photons suppression

A typical PET scintillator has efficiency ~ 20-25%

# Multi-gap GIC design

Max yield for 511 KeV:

$(23.8 \pm 0.4)\%$

converter Bi, 50  $\mu\text{m}$

glass 50  $\mu\text{m}$

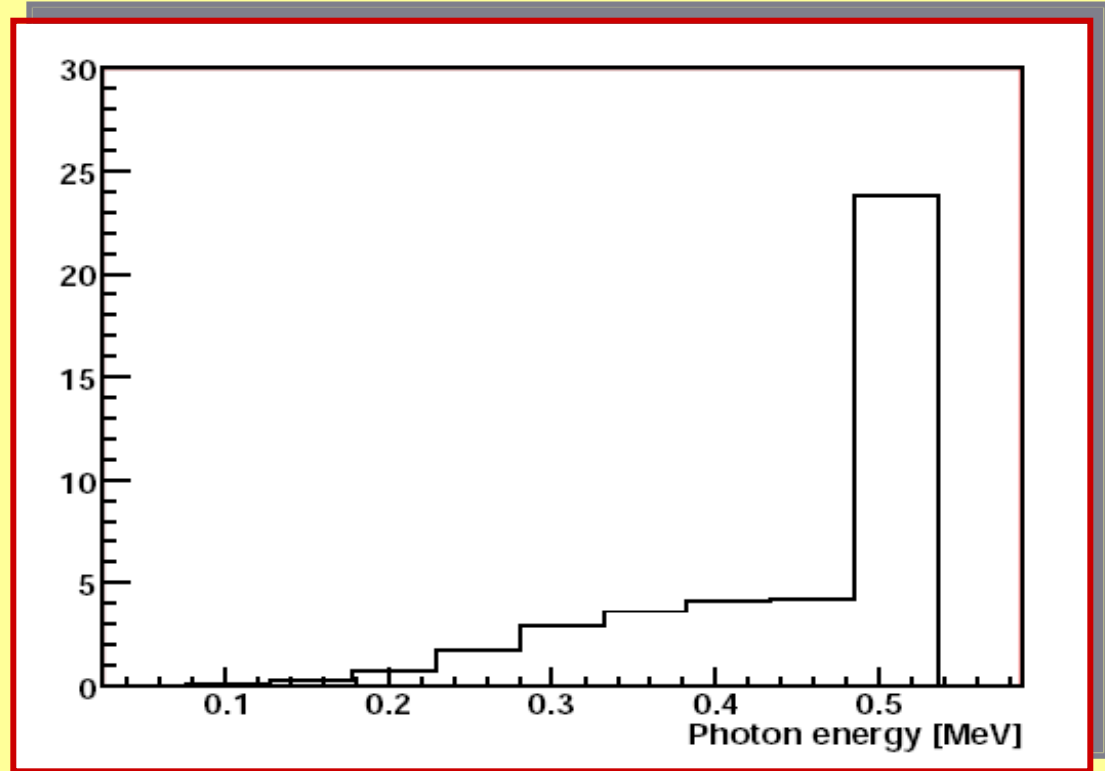

Highest sensitivity for 511 KeV

511 / 307  $\sim$  2:1

# Multi-gap GIC design

86% from the registered photons have energies  $> 383 \text{ KeV}$

## Our prototypes ...

RPCs in an avalanche mode.

	small prototype	full scale prototype
number of gaps	6	6
gas gap	$200 \mu m$	$200 \mu m$
glass thickness	$150 \mu m$	$100 \mu m$
dimensions	$120mm \times 70mm$	$350mm \times 70mm$

Electrodes should have “exact” resistivity, very smooth surface, etc.  
So one needs to be very careful with the materials for the electrodes.

## Our prototypes ...

Our prototypes are made out of **FLOATING GLASS**

**HV electrodes  
formation  
(small  
prototypes  
120x70 mm)**

**Strips layout  
and  
construction  
of small  
prototypes  
(120x70 mm)**

# Cosmic muons

$s(x)=a/(1+\exp(-b*(x-v_0)))$  — green line  
Fit margins — black line  
Average(Q) — magenta line

$a=0.292443\pm 0.00327193$   
 $b=0.00118609\pm 6.75155e-05$   
 $V_0=11301.6\pm 25.2419$

# The efficiency

The measured efficiency  $> 29 \%$

The measured efficiency = (**RPC efficiency**) $\times$ (Geometrical Acceptance)

The Geometrical acceptance is  $\sim 30 \%$ ,

so the **RPC efficiency** is  $> 95 \%$

Only an ADC is used (no dedicated front-end electronics, amplifiers, etc. !!!)

## Conclusions

- Model investigations towards the design of an RPC-based PET detector is performed

Multi-gap Gas-Insulator-Converter design. In the multi-gap GIC design, the yield increases with the number of gaps. For 100 gaps the RPC efficiency seems to be comparable with the typical PET scintillator efficiency.

Optimized in the context of PET purposes parameters:

100 gaps; 50  $\mu\text{m}$  Bi converter between 50÷100  $\mu\text{m}$  glass plates

the electron yield in the gas increases to 24%

sensitivity 511  $\text{KeV}$  photons / 307  $\text{KeV}$  photons  $\sim$  2:1;

About 86% of the registered in the PET process photons are with energies above 380  $\text{KeV}$ .

- First few detector prototypes are ready and are under study.
- The efficiency for muons is very high as expected (95+%), even without dedicated front-end electronics. Tests with photons are the next step.

This work is supported by Bulgarian National Science Fund  
(contract DO 02-183/2008).

# Дози при PET

При PET се налага излагане на пациента на действието на йонизиращо лъчение.

Пълната доза е малка, обикновено около **7 mSv**.

За сравнение:

- средногодишната доза, дължаща се на фонова радиация във Великобритания е **2.2 mSv**
- **0.02 mSv** е дозата при Рентгенова снимка на гръдния кош
- **8 mSv** за СТ (компютърна томография) на гръден кош
- **2-6 mSv** на година за въздушен персонал (пилоти и стюардеси)
- **7.8 mSv** от фонова радиация в областта Cornwall във Великобритания
