

Flavour physics at future colliders

Sophie Renner, Workshop on Future Accelerators, Corfu 2023

Particle physics after the LHC...

Option 1: something new

Option 2: *SM* still reigns

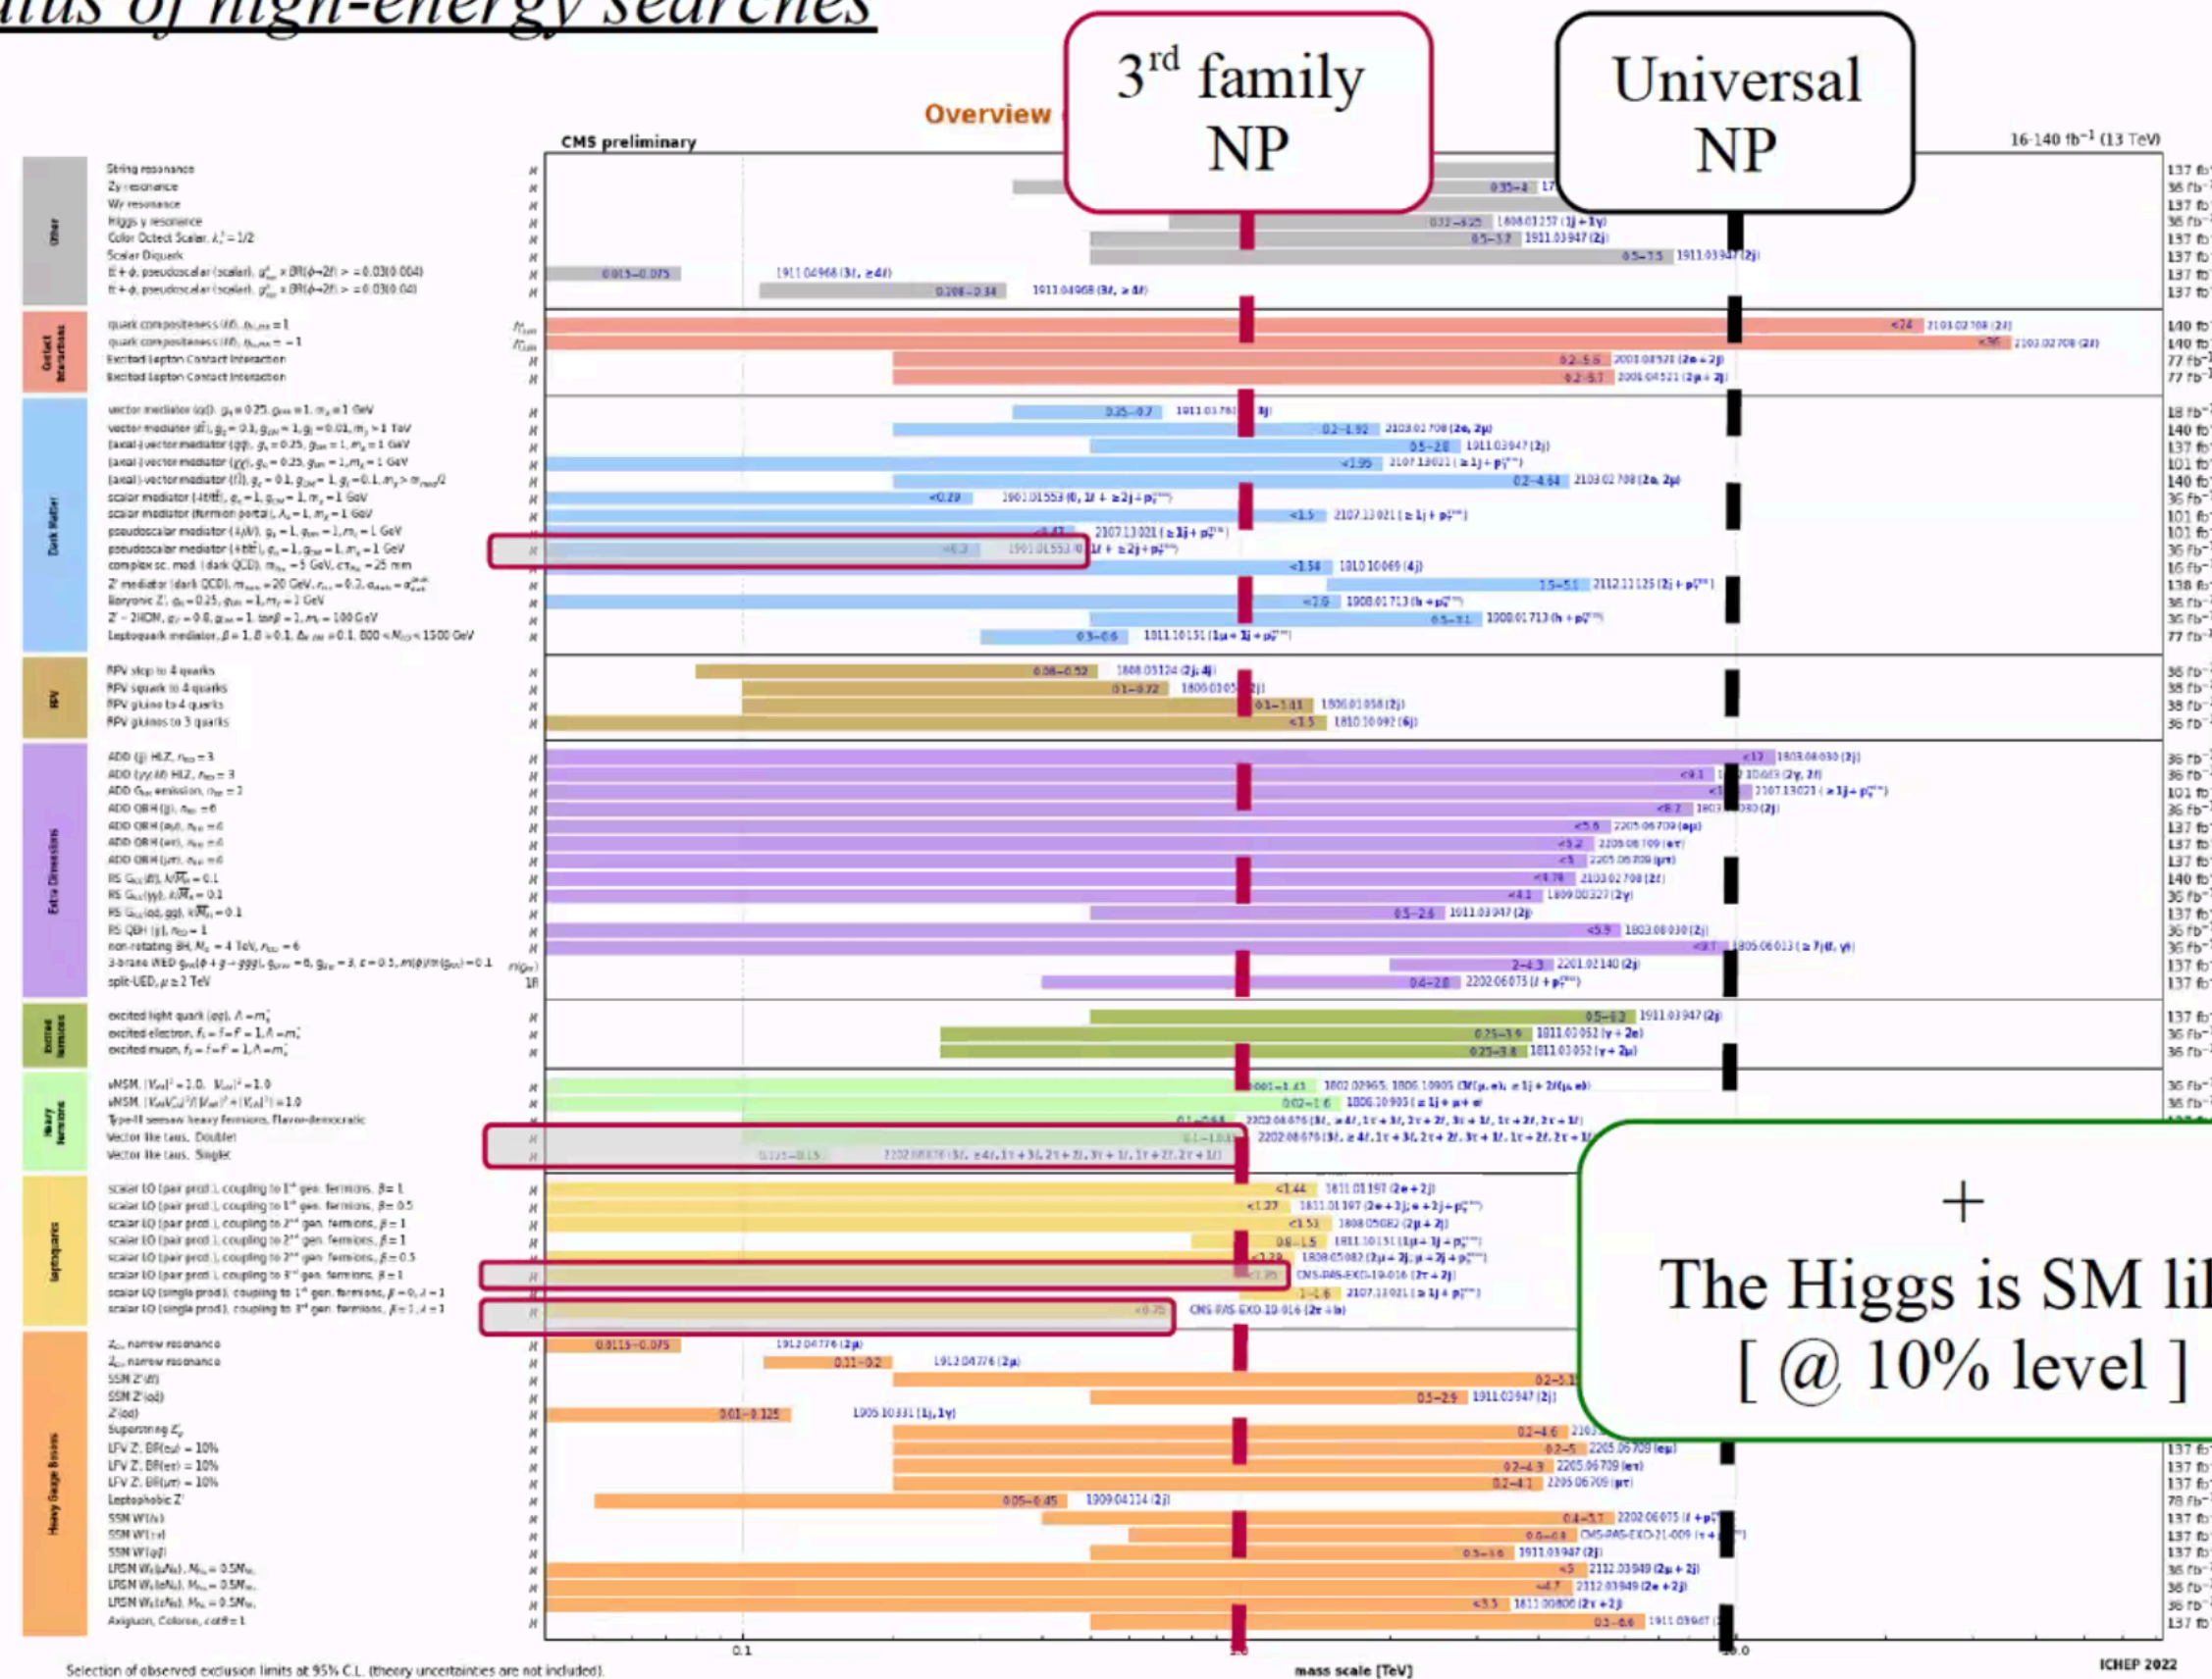

Is there still space for TeV-ish new physics? - where to look?

Best case scenario: flavourful physics

G. Isidori – Decoding flavor hierarchies

CERN – 29th March 2023

► Status of high-energy searches

If BSM physics couples differently to different flavours, bounds change

In particular, lowest bounds if NP couples only to 3rd family

At LHC: PDF suppression
Low energy: 3rd generations
less precisely measured

Is the third generation special?

Not just a convenient way to lower the scales...

Hierarchy problem

Light top partners/stops

Connection to *SM* flavour structure, e.g. flavour-dependent gauge interactions

Origin of Yukawas

Davighi, Tooby-Smith 2201.07245

Fuentes-Martin, Isidori, Lizana, Selimovic, Stefanek, 2203.01952

Davighi, Isidori 2303.01520, ...

B anomalies

What this means for a future collider

Points to some aims for a new collider:

- ★ Testing the Yukawa sector Higgs couplings to fermions, CKM tests
- ★ Searching for new flavour changing interactions involving 3rd generation fermions
- ★ Searching for new flavour-conserving interactions involving 3rd generation fermions

Examples of how FCC-ee addresses each of these and what it might mean for BSM

FCC-ee is a flavour factory

FCC Snowmass report, 2203.06520

Numbers for decays of $5 \times 10^{12} Z^0$ s:

Lenz & Monteil, 2207.11055

Particle species	B^0	B^+	B_s^0	Λ_b	B_c^+	$c\bar{c}$	$\tau^-\tau^+$
Yield ($\times 10^9$)	310	310	75	65	1.5	600	170

$O(10^{11})$ B mesons

About 15 times larger than Belle II dataset

Combines the advantages of B factories and LHCb: highly boosted particles in a clean environment

(I will focus on FCC-ee, but similar numbers are projected for CEPC)

Status of flavour physics at start of FCC-ee

HL-LHC and Belle II will have completed their runs

Possible unitarity triangle after LHCb HL-LHC

Bediaga et al, 1808.08865

FCNC highlights

Belle II will measure $B \rightarrow K^{(*)} \bar{\nu} \nu$ to 10%

$B_{s,d} \rightarrow \mu^+ \mu^-$
at LHC

The Standard Model Effective Field Theory

Approximate the effects of all possible heavy particles by writing down all possible new interactions between SM particles

$$\mathcal{L}_{\text{SMEFT}} = \frac{1}{\Lambda^2} \sum_i C_i O_i + \mathcal{O}\left(\frac{1}{\Lambda^4}\right)$$

Operators are suppressed by BSM scale

Λ

Different classes of operators built from SM fields...

$$X^3 \quad H^6 \quad H^4 D^2 \quad \psi \bar{\psi} H^2 D \quad \psi \bar{\psi} H^3 \quad \psi \bar{\psi} X H \quad X^2 H^2 \quad \bar{\psi}^2 \psi^2$$

$$X = B_{\mu\nu}, G_{\mu\nu}^A, W_{\mu\nu}^I$$

$$\psi = Q, u, d, L, e$$

Parameters of the theory are contained in the Wilson coefficients

The search for new physics can be translated into searches in Wilson coefficient space

SMEFT in 2040

Projected fit to top-containing operators

De Blas et al, 2206.08326

Lighter shade: single-parameter fit
 Darker shade: marginalised fit

Some operators are only constrained to below 1 TeV, even after HL-LHC

Other types of flavoured operators have not been systematically studied (even using current data)

Bellafronte, Dawson,
 Giardino
 2304.00029

Yukawas and CKM

Higgs couplings to fermions

Projected precision (%):

FCC Snowmass report, 2203.06520

Collider	HL-LHC	FCC-ee _{240→365}	FCC-ee + HL-LHC	FCC-INT	FCC-INT + HL-LHC	
Int. Lumi (ab ⁻¹)	3	5 + 0.2 + 1.5	–	30	–	
Years	10	3 + 1 + 4	–	25	–	
FCC-ee matters most	g_{Hbb} (%)	5.1	0.69	0.64	0.48	0.48
	g_{Hcc} (%)	SM	1.3	1.3	0.96	0.96
	$g_{H\tau\tau}$ (%)	1.9	0.74	0.66	0.49	0.46
FCC-hh matters most	$g_{H\mu\mu}$ (%)	4.4	8.9	3.9	0.43	0.43
	g_{Htt} (%)	3.4	–	3.1	1.0	0.95

In the SMEFT at dim 6, each of these decays is modified by a single operator:

$\mathfrak{5} : \psi^2 H^3 + \text{h.c.}$	
Q_{eH}	$(H^\dagger H)(\bar{l}_p e_r H)$
Q_{uH}	$(H^\dagger H)(\bar{q}_p u_r \tilde{H})$
Q_{dH}	$(H^\dagger H)(\bar{q}_p d_r H)$

$$\longrightarrow \frac{v^2}{2\sqrt{2}} (v + 3h + \dots) \bar{q}_L u_R$$

These operators can be generated at tree level in some models, e.g. 2HDM

\implies test of the Yukawa sector

V_{cb} at FCC-ee

?

$$|V_{cb}|^{\text{incl.,2022}} = (42.16 \pm 0.51) \cdot 10^{-3}$$

$$|V_{cb}|^{\text{excl.,PDG}} = (39.5 \pm 0.9) \cdot 10^{-3}$$

Discrepancy between inclusive and exclusive determinations of V_{cb}

With $B_c \rightarrow \tau^+ \nu$ decays

Amhis, Hartmann, Helsen, Hill, Sumensari 2105.13330
Zheng et al, 2007.08234 (CEPC study)

No form factors, just a decay constant

But need to know B_c fraction

With W decays

Precision depends on tagging of b and c jets

Estimated achievable precision 0.4% Marie-Helene Schune, FCC-ee workshop 2020

Similar story for V_{ub}

With top decays

Harrison & Vladimirov, 1810.09424

Even more direct measurements of e.g. V_{ts}

'CKM' in the SMEFT

In the absence of some symmetry forbidding it (e.g. R-parity), new physics can enter at tree level in observables from which the CKM is extracted

Possible SMEFT effects in CKM fits must be carefully propagated through Descotes-Genon et al., 1812.08163

Or do a bespoke CKM fit in which SMEFT effects cancel (only possible with flavour assumptions)

Aoude, Hurth, SR, Shepherd, 2003.05432

e.g.

All three of these operators contribute to $b \rightarrow c \ell \bar{\nu}$
 But only one contributes to $W \rightarrow \bar{b}c$

Easier to isolate new physics with more observables
 Possibility of combined CKM + SMEFT fits?

Flavour and EW precision

Flavour and EW precision

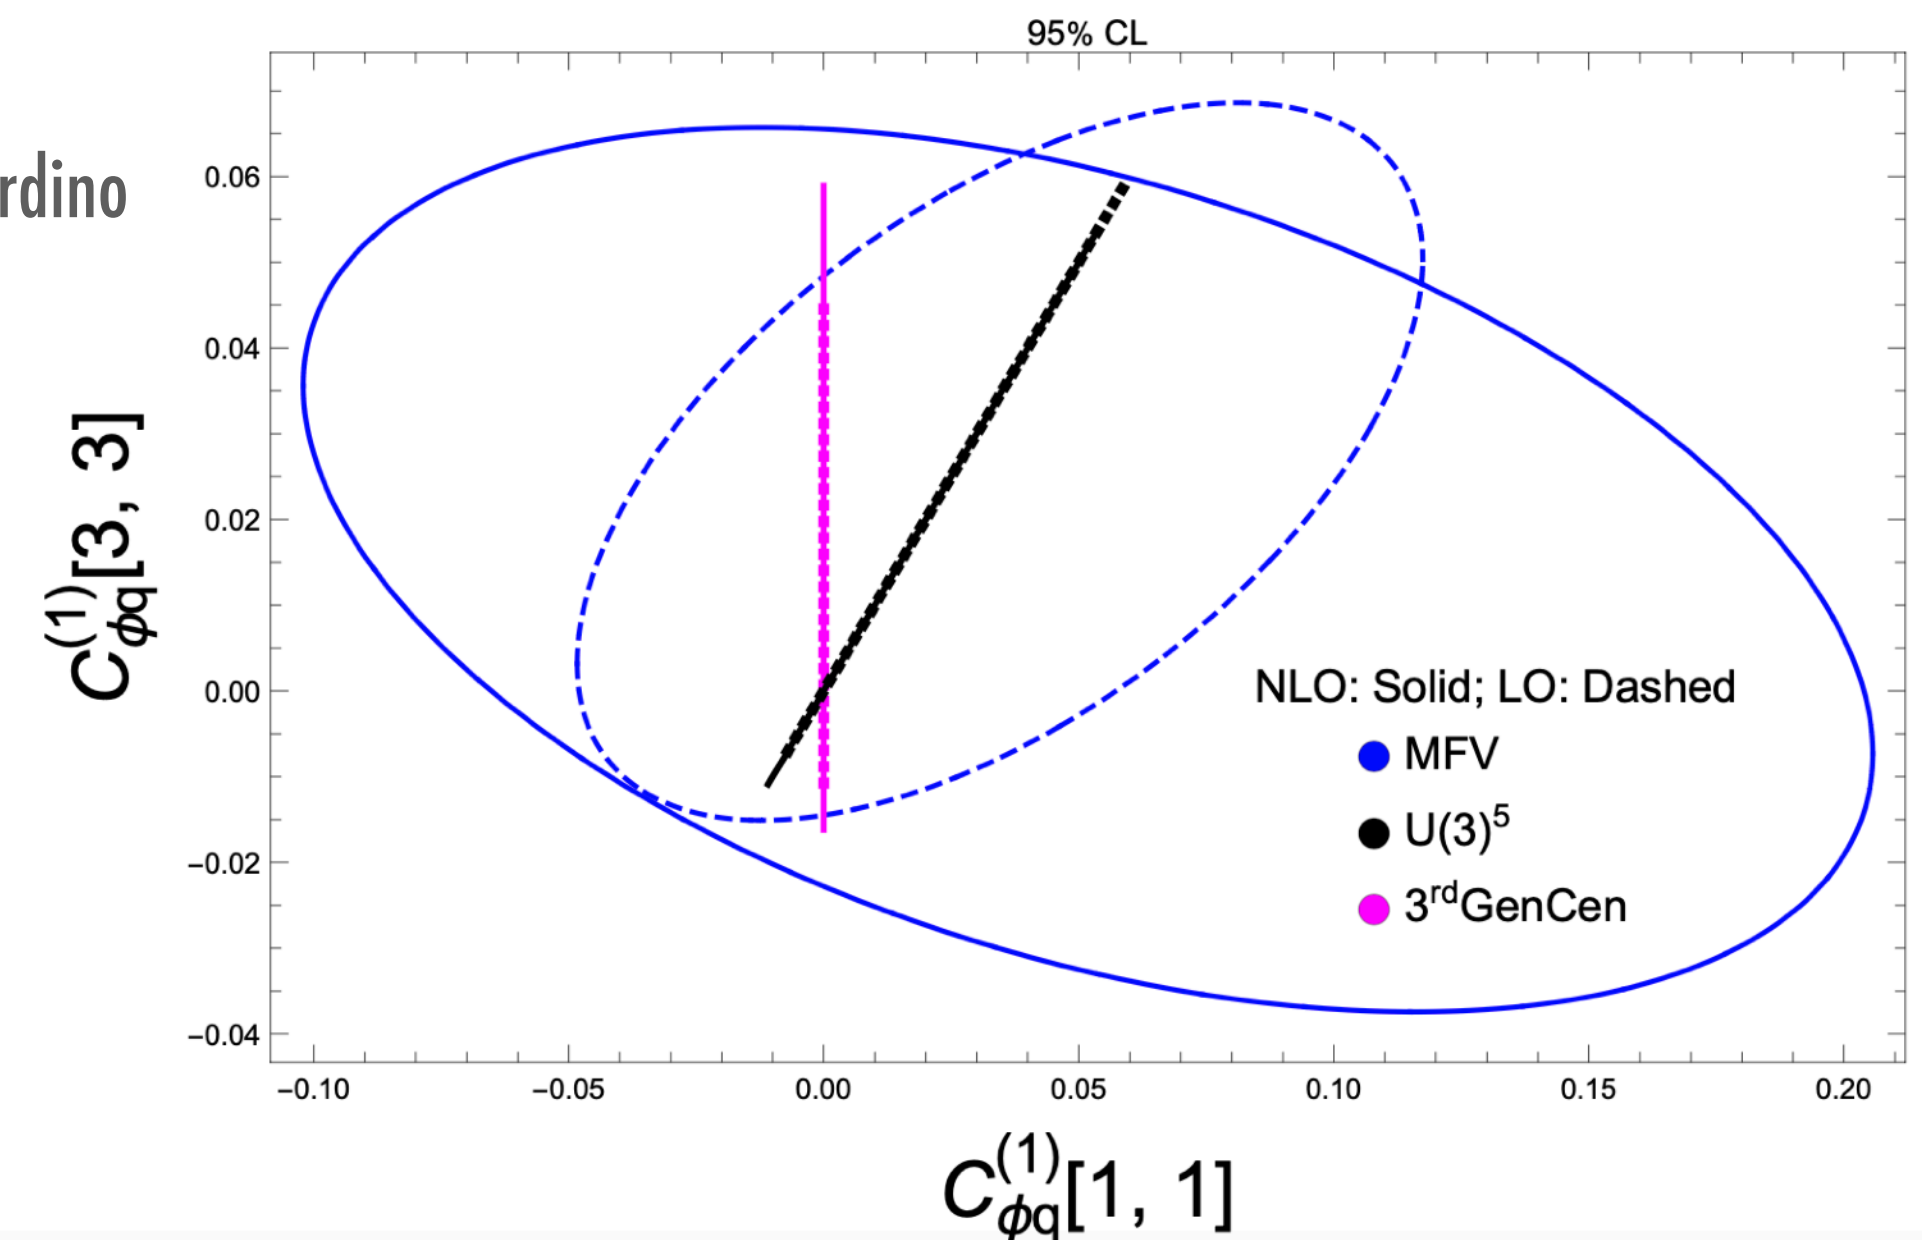

For Z pole measurements, flavour matters

4-lepton operators

Bellafronte, Dawson, Giardino

Z-quark operators

Bounds from EW precision on flavour of BSM?

Liu, Wang, Zhang, Zhang, Gu 2205.05655

Individual bounds

	$c_{\varphi t}$	$c_{\varphi Q}^{(-)}$	c_{tW}	c_{tB}
Electroweak	0.233	0.286	0.438	0.36
LHC data	2.275	1.22	0.06	0.145

LEP outperforms LHC on some top operators

Flavoured decays involving τ s

B decays into τ s after Belle II and HL-LHCb

$$B \rightarrow K \tau^+ \tau^-$$

SM branching ratio: $(1.44 \pm 0.15) \times 10^{-7}$ HPQCD, 1306.0434

Current limits: 5 orders of magnitude above SM

After Belle II: $BR \leq 10^{-4} - 10^{-5}$

$$B_s \rightarrow \tau^+ \tau^-$$

Bobeth, 1405.4907

$\text{Br}(B_s \rightarrow \tau^+ \tau^-)_{\text{SM}} = (7.73 \pm 0.49) \times 10^{-7}$

$\text{Br}(B_s \rightarrow \tau^+ \tau^-)_{\text{EXP}} \leq 6.8 \times 10^{-3}$ LHCb, 1703.02508

Ho, Jiang, Kwok, Li, Liu 2212.02433

$B \rightarrow K^{(*)} \tau^+ \tau^-$ at FCC-ee

Can't be well studied at LHCb or Belle II

$\mathcal{O}(10^3)$ reconstructed $B \rightarrow K^* \tau^+ \tau^-$ events
Can measure τ polarization observables

Kamenik, Monteil, Semkiv, Silva, 1705.11106

e.g.

Likely that new physics that speaks only to the third generation should show up here

$B \rightarrow K^{(*)} \tau^+ \tau^-$ in the SMEFT

$$O_{lq}^{(1)ijkl} = (\bar{L}^i \gamma_\mu L^j) (\bar{Q}^k \gamma^\mu Q^l)$$

$$O_{lq}^{(3)ijkl} = (\bar{L}^i \gamma_\mu \tau^I L^j) (\bar{Q}^k \gamma^\mu \tau^I Q^l)$$

$$O_{qe}^{ijkl} = (\bar{e}^i \gamma_\mu e^j) (\bar{Q}^k \gamma^\mu Q^l)$$

$$R_D^{(*)} \propto C_{lq}^{(3)}$$

$$B \rightarrow K^{(*)} \bar{\nu} \nu \propto C_{lq}^{(1)} - C_{lq}^{(3)}$$

$$B \rightarrow K^{(*)} \tau^+ \tau^- \propto C_{lq}^{(1)} + C_{lq}^{(3)}$$

Can have large $R_D^{(*)}$ without disagreement with $B \rightarrow K^{(*)} \bar{\nu} \nu$ if

$$C_{lq}^{(1)} = C_{lq}^{(3)}$$

If the anomalies in $R_D^{(*)}$ persist, expect large deviations in $B \rightarrow K^{(*)} \tau^+ \tau^-$ and $B_s \rightarrow \tau^+ \tau^-$

If not, these observables combined will constrain the relevant operators to $O(10 \text{ TeV})$

Lepton flavour universality tests

All the tests of LFUV can be tests of the same physics

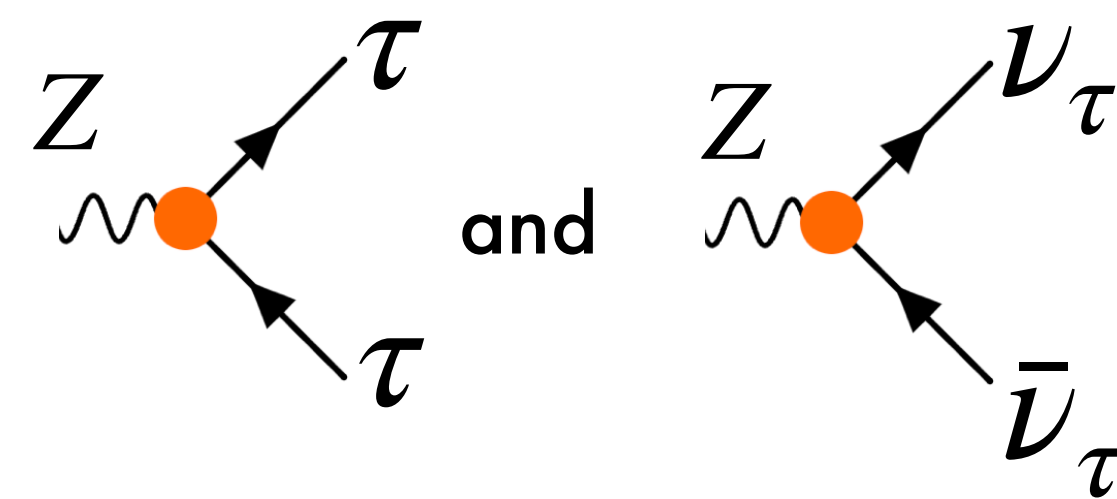

Tau decays

Z decays

B decays

$$O_{\phi l}^{(1,3)}$$

$$(\phi^\dagger D_\mu \tau^a \phi)(\bar{L}^3 \gamma^\mu L^3)$$

$$O_{ll}$$

$$(\bar{L}^2 \gamma_\mu L^2)(\bar{L}^3 \gamma^\mu L^3)$$

Lepton flavour violation at FCC-ee

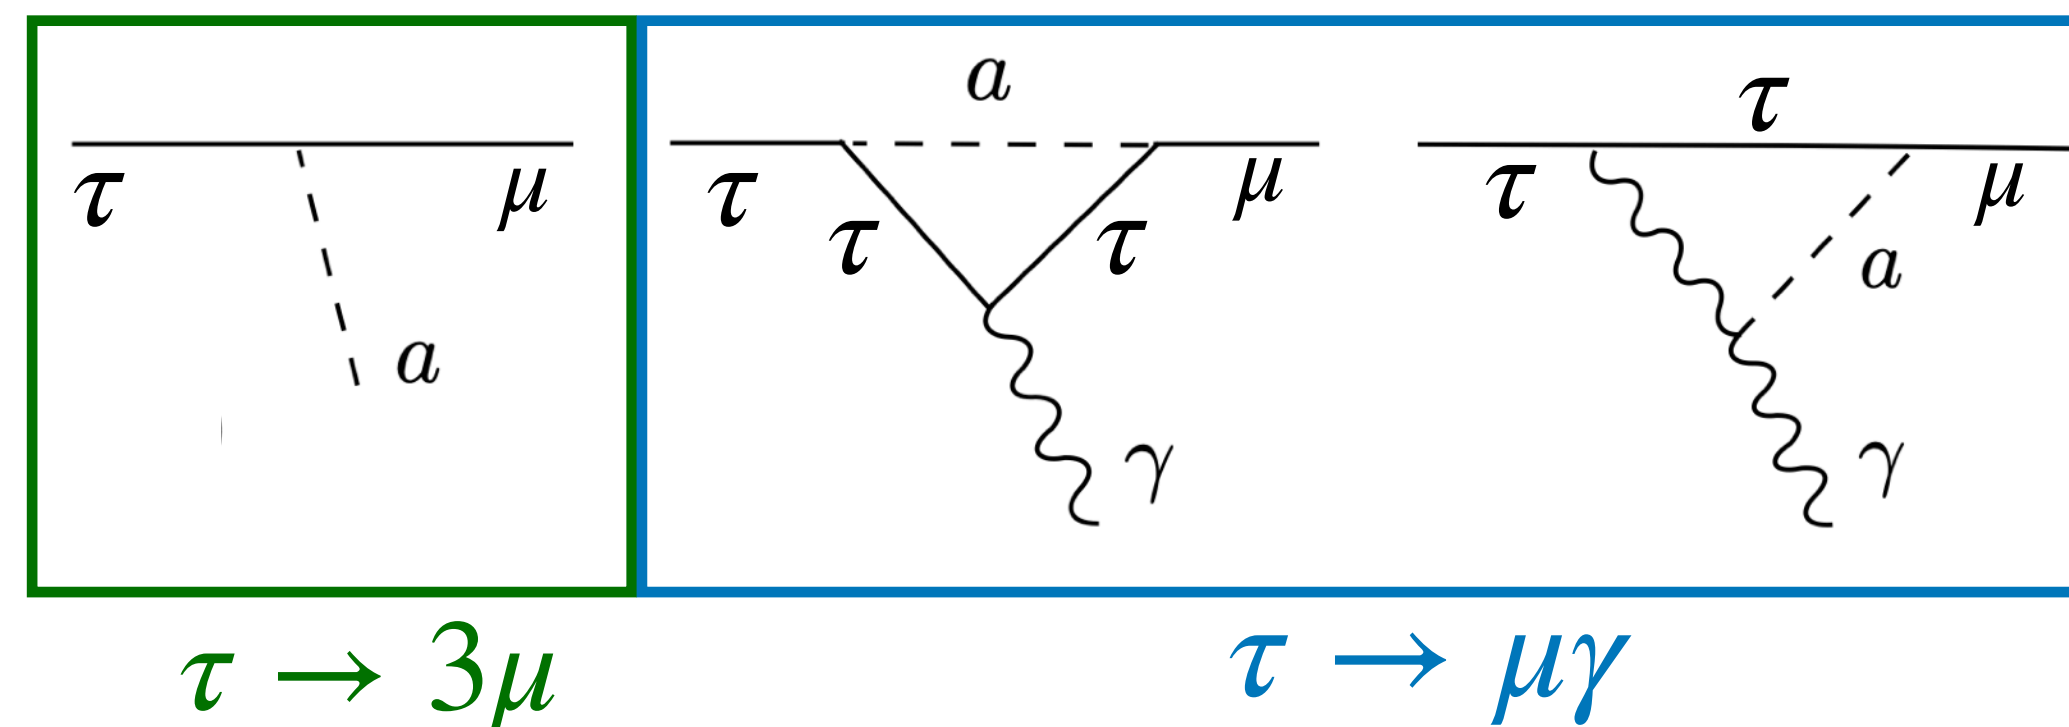

FCC Snowmass report, 2203.06520

Decay	Present bound	FCC-ee sensitivity
$Z \rightarrow \mu e$	0.75×10^{-6}	$10^{-10} - 10^{-8}$
$Z \rightarrow \tau \mu$	12×10^{-6}	10^{-9}
$Z \rightarrow \tau e$	9.8×10^{-6}	10^{-9}
$\tau \rightarrow \mu \gamma$	4.4×10^{-8}	2×10^{-9}
$\tau \rightarrow 3\mu$	2.1×10^{-8}	10^{-10}

In SMEFT, if you have $Z \rightarrow \tau \mu$, then you generate $\tau \rightarrow 3\mu$ and $\tau \rightarrow \mu \gamma$

With light new physics, can get a resonant enhancement of $\tau \rightarrow 3\mu$

From FCC-ee to FCC-hh

A measured non-zero value of SMEFT Wilson coefficient(s) could provide a no-lose theorem for FCC-hh

Measure $\frac{C_i}{\Lambda^2} = x \implies$ at energies $E \lesssim \frac{4\pi}{\sqrt{x}}$, amplitude violates unitarity

If not, any new physics at FCC-hh will have to pass stringent indirect tests, à la S, T parameters of LEP: informs search strategies

Summary

After the LHC, questions will still remain about the third generation of fermions and about the Yukawa sector of the SM

FCC-ee provides multiple lines of attack to close in on these, including:

- *Flavour factory* via copious b, c mesons and τ s produced at the Z pole
- *Measurements of Higgs couplings to fermions*
- *Precision Z pole and W pole measurements*
- *Top precision*

All of these play an important role, and their combination will help understand flavour in the SM and beyond
