CERN

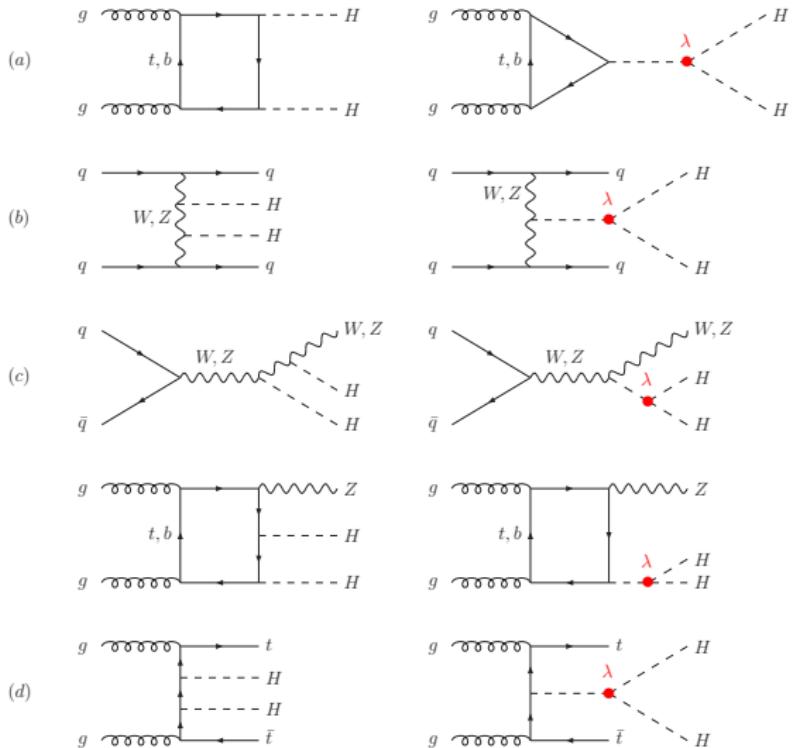

# Introduction

---

# Double Higgs production at the LHC

## Production processes

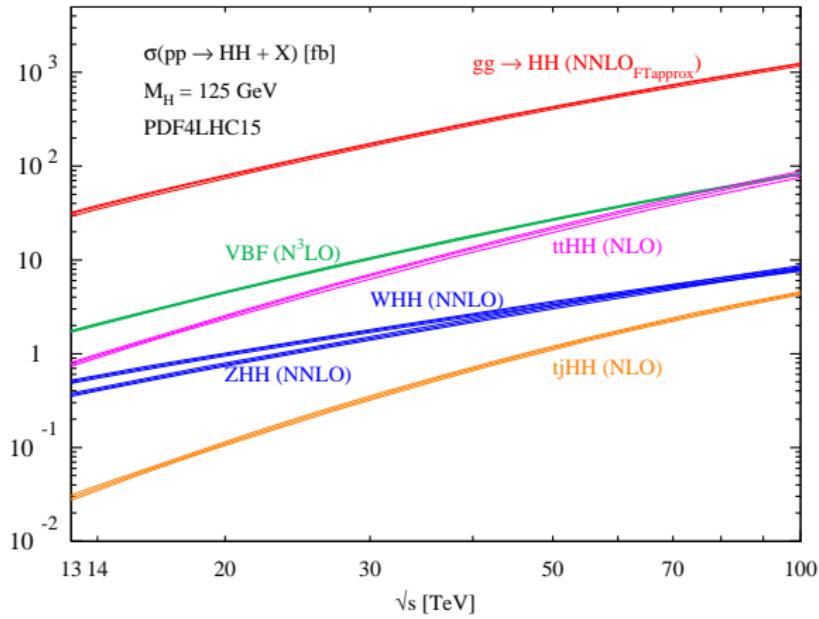

- (a) gluon fusion
- (b) VBF
- (c) double-Higgs strahlung
- (d) top quark associated production

[D] Micco et al., Rev.Phys. 5 (2022) 100045]

# Production channels

- Gluon fusion is the dominant production process

[Di Micco et al., Rev.Phys. 5 (2020) 100045]

# Theoretical status of $ggHH$ calculations

## Available results

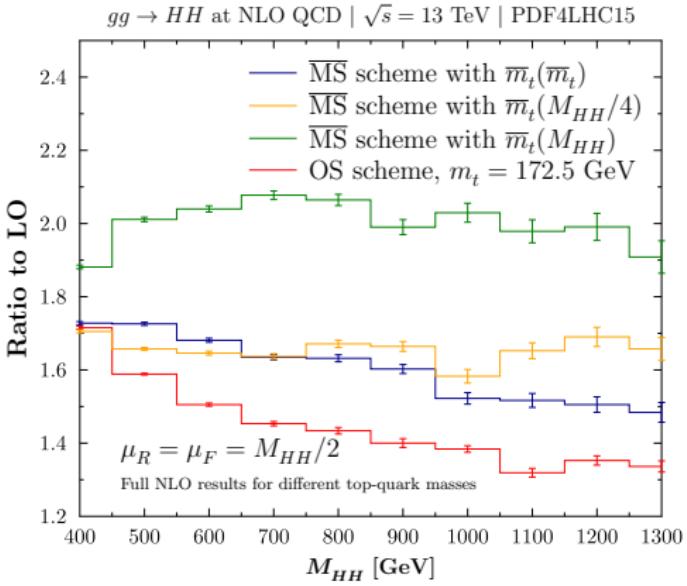

- NLO in the  $m_t \rightarrow \infty$  limit [Dawson et al. PRD58 (1998) 115012]
- Full NLO [Borowka et al., PRL17 (2016) 012001; Baglio et al., EPJC79 (2019) 6, 459; Baglio et al., JHEP 04 (2020) 181]
- NNLO in the  $m_t \rightarrow \infty$  limit [de Florian et al, PRL111 (2013) 201801]
- NNLL in in the  $m_t \rightarrow \infty$  [Shao et al., JHEP07 (2013) 169; de Florian et al, JHEP09 (2015) 053]
- NNLO FTa [Grazzini et al, JHEP05 (2018) 059]
- Differential NNLO in the  $m_t \rightarrow \infty$  [De Florian et al., JHEP09 (2016) 151]
- Approximate NNLO QCD[JHEP 09 (2021) 161]
- Virtual corrections for NNLO in the  $m_t \rightarrow \infty$  limit [De Florian et al., PLBB724 (2013) 306; Grigo et al., NPB888 (2014) 17]
- 2-loop matrix elements using HE expansion [Davies et al., JHEP 03 (2018) 048; Davies et al.,JHEP 01 (2019) 176]
- 2-loop matrix elements using  $p_T$  expansion, combination with HE expansion [Bonciani et al., PRL121 (2018), 16200; Bellafronte et al., JHEP 07 (2022) 069]
- 2-loop matrix elements using small mass expansion [Xu et al., JHEP 01 (2019) 211; Want et al., , PRD104 no. 5, (2021)]
- Monte Carlo full NLO [Heinrich et al., JHEP08 (2017) 088; Jones et al., JHEP02 (2018) 176; Heinrich et al., JHEP10 (2020) 021]
- Top scheme uncertainties [Baglio et al., PRD 103 (2021) 5, 056002]

...

# Impact of the choice of the top mass scheme

## Top scheme uncertainty

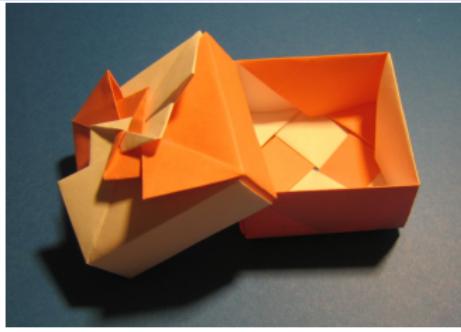

- Uncertainty due to the renormalization scheme choice of the top mass
- First shown in [Baglio et al., EPJC79 (2019) 6, 459]
- More in depth studied in [Baglio et al., PRD 103 (2021) 5, 056002]

# Yet another Monte Carlo

## Our goal

- Currently available Monte Carlo event generator in the POWHEG-BOX is based around the 2-loop results of Borowka et al., PRL17 (2016) 012001, which are implemented using a series of interpolation grids (to account for modified trilinears etc.) matched with the HE expansion
- Fixed values of the input parameters; no possibility of changing the top mass scheme;
- Develop a new MC event generator based around the  $p_T$  and HE expansions
- Allow to vary the input parameters; implement renormalization scheme dependence

# The 2-loop amplitudes: transverse momentum expansions

## $p_T^H$ expansion

- The  $gg \rightarrow HH$  amplitude can be written as

$$A^{\mu\nu} = \frac{G_F}{\sqrt{2}} \frac{\alpha_s(\mu_R)}{2\pi} \delta_{ab} T_F \hat{s} [A_1^{\mu\nu} F_1 + A_2^{\mu\nu} F_2]$$

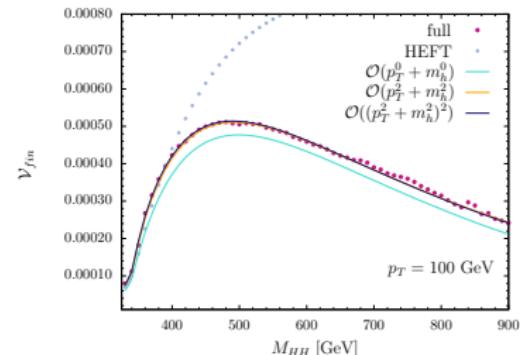

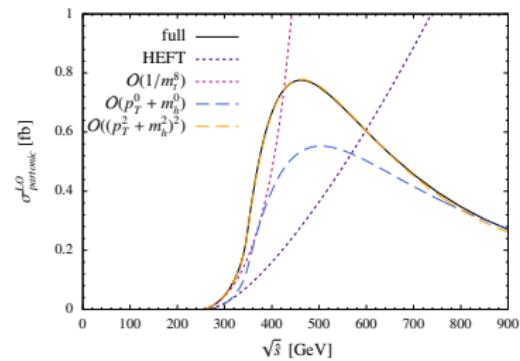

- The transverse momentum can be written in terms of Mandelstam variables

$$(p_T^H)^2 = \frac{\hat{t}\hat{u} - m_h^4}{\hat{s}}$$

- Rewritten as

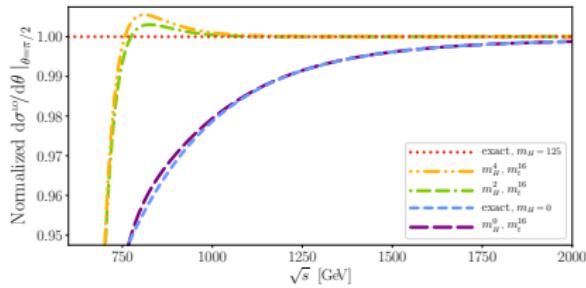

$$(p_T^H)^2 = \frac{\hat{t}\hat{u} - m_h^4}{\hat{s}}$$

- Expand in  $(p_T^H)^2/s' \ll 1$  and  $m_h^2/s' \ll 1$  where  $s' = \hat{s}/2$
- Very good description up to  $\hat{s} < 750$  GeV.

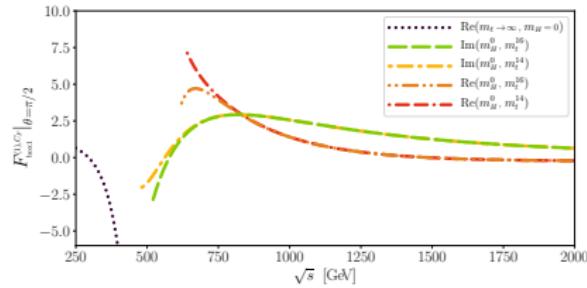

# The 2-loop amplitudes: high-energy expansion

- High-energy expansion of the two loop form factors
- Valid down to around 700 GeV
- Complementary range with respect to the  $p_T^H$  expansion

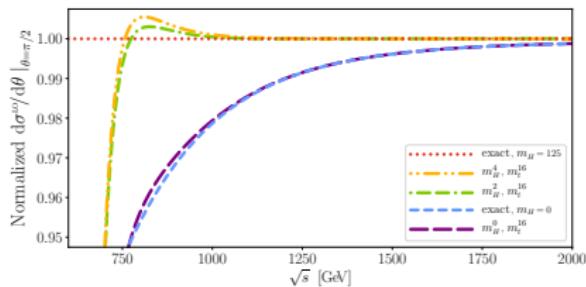

Cross-check at LO

[Davies et al., JHEP 03 (2018) 048; Davies et al., JHEP 01 (2019) 176];

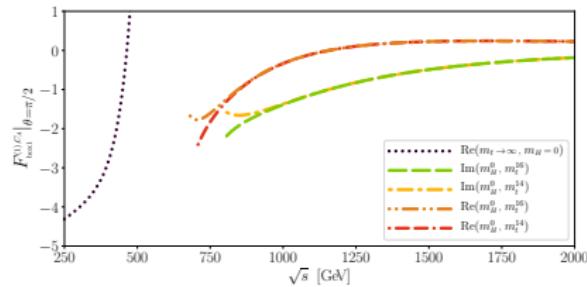

# The 2-loop amplitudes: high-energy expansion

- High-energy expansion of the two loop form factors
- Valid down to around 700 GeV
- Complementary range with respect to the  $p_T^H$  expansion

Cross-check at LO

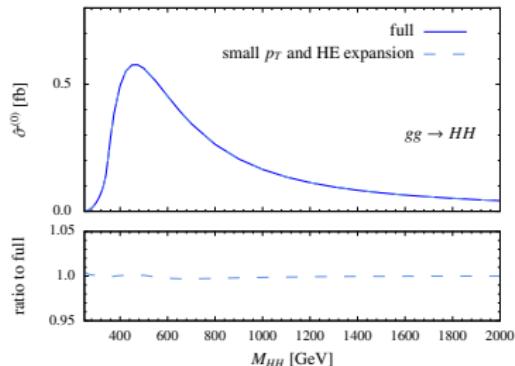

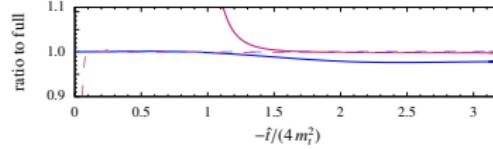

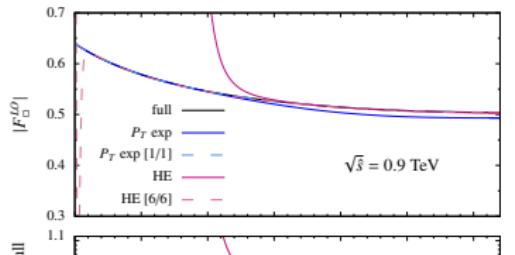

[Davies et al., JHEP 03 (2018) 048; Davies et al., JHEP 01 (2019) 176];

# The 2-loop amplitudes: combining the two expansions

- The two expansions work well in complementary kinematic range
- Build a combined result that therefore reproduces very well the full top mass dependence all across the phase space
- Padé approximant

$$[m/n](x) = \frac{p_0 + p_1 x + \dots + p_m x^m}{1 + q_1 x + \dots + q_n x^n}$$

- [1/1] for the  $p_T^H$  expansion, [6/6] for the HE expansion sufficient to have a good behavior across all the  $\sqrt{s}$  range

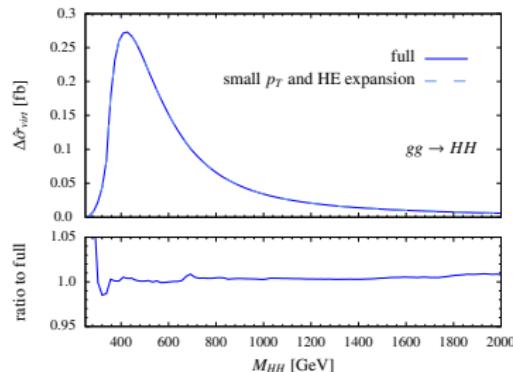

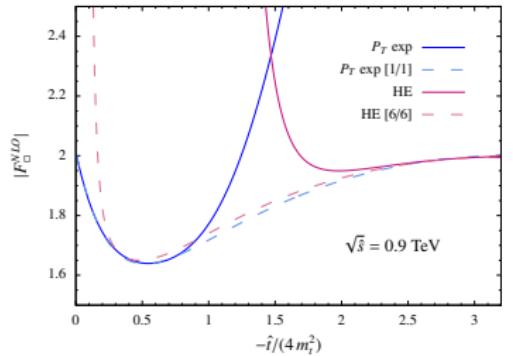

HH MC generator in the POWHEG-BOX and top mass uncertainties

# The 2-loop amplitudes: combining the two expansions

- The two expansions work well in complementary kinematic range
- Build a combined result that therefore reproduces very well the full top mass dependence all across the phase space
- Padé approximant

$$[m/n](x) = \frac{p_0 + p_1 x + \dots + p_m x^m}{1 + q_1 x + \dots + q_n x^n}$$

- [1/1] for the  $p_T^H$  expansion, [6/6] for the HE expansion sufficient to have a good behavior across all the  $\sqrt{s}$  range

# The Monte Carlo

---

# The MC framework

- We implement a MC in the POWHEG-BOX framework that uses the Padé-combined expansions as the two-loop matrix elements
- The real matrix elements is obtained with MadLoop

$$\left( \frac{d\sigma}{dO} \right)_{\text{POWHEG}} = \sum_{n \geq 1} \int \left[ \bar{B}^s d\Phi_B \left\{ \Delta_{t_{\min}}^s + \Delta_t^s \frac{R_{\text{POWHEG}}^s}{B} d\Phi_r \right\} \right. \\ \left. + R_{\text{POWHEG}}^f \otimes \Gamma d\Phi + R_{\text{reg}} \otimes \Gamma d\Phi \right] \frac{d\Phi_{n-1}^{\text{MC}}}{dO} \mathcal{I}_{n-1}(t_1 \equiv p_{\perp}^{\text{rad}})$$
$$\bar{B}^s = B(\Phi_b) + \left[ V(\Phi_b) + \int d\Phi_{R|B} \hat{R}_{\text{POWHEG}}^s(\Phi_{R|B}) \right]$$
$$\Delta_t^s(\bar{\Phi}_B, p_T) = \exp \left\{ - \int d\Phi_{\text{rad}} \frac{R_{\text{POWHEG}}^s(\bar{\Phi}_B, \Phi_{\text{rad}})}{B(\Phi_1)} \theta(k_T - p_T) \right\}$$
$$R_{\text{POWHEG}}^s = \frac{h^2}{h^2 + p_T^2} R \quad , \quad R_{\text{POWHEG}}^f = \frac{p_T^2}{h^2 + p_T^2} R$$

# Results

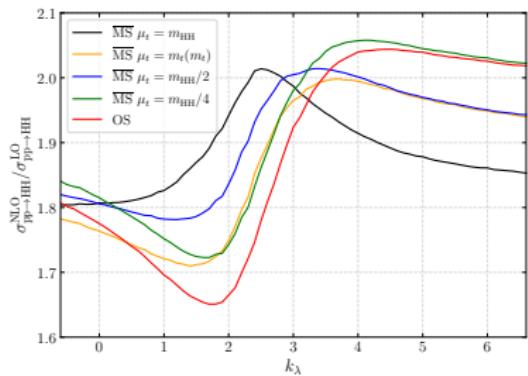

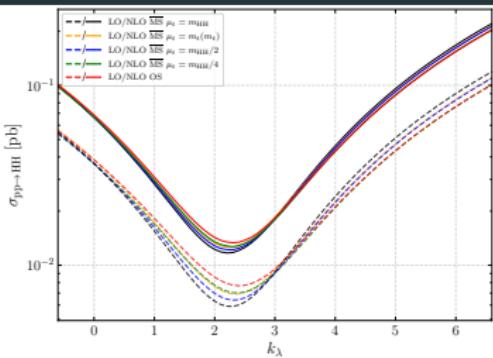

---

# Setup and input parameters

## Setup

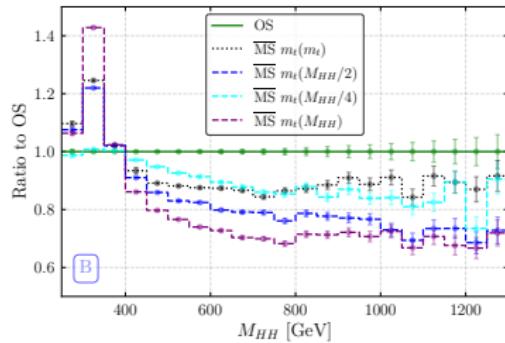

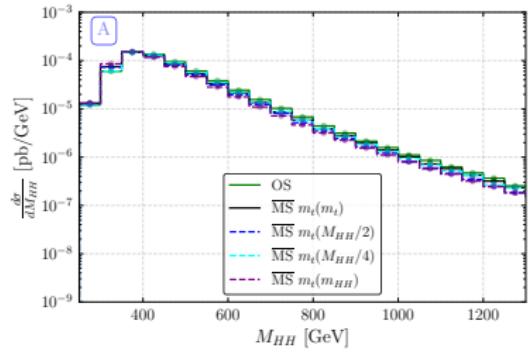

- LHC,  $\sqrt{S} = 13.6$  TeV
- NNPDF31\_as\_0118\_NLO
- $\mu_R = \mu_F = M_{HH}/2$
- $M_H = 125$  GeV,  $M_T = 172.5$  GeV
- Consider both OS  $M_T$  and  $\overline{MS}$   $m_t$  ( $\mu_t = m_t(m_t), m_{HH}/2, m_{HH}/4, m_{HH}$ )

# Inclusive cross sections and k-factors

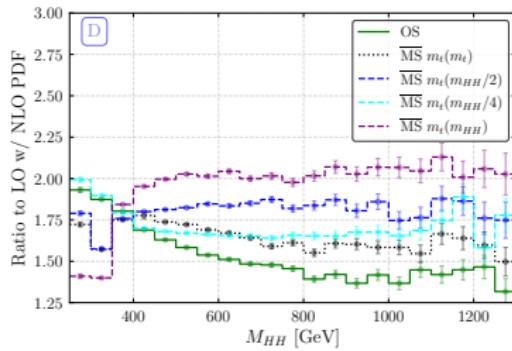

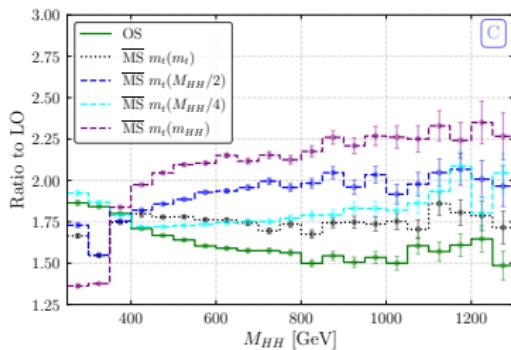

- Total inclusive cross section at LO and NLO for different values of  $k_\lambda$  and different choices of the top mass renormalization scheme
  - Minimum of the cross section depends on the top scheme
  - As expected, the difference between the schemes is smaller at NLO
  - We have found some disagreement with existing calculations, currently under investigation → see Gudrun's talk at the recent *Discussion on MC* at NLO QCD meeting event for an update of the existing **POWHEG-BOX** Monte Carlo
- K-factors for different top mass scheme choices

# SM top scheme dependence: $M_{HH}$

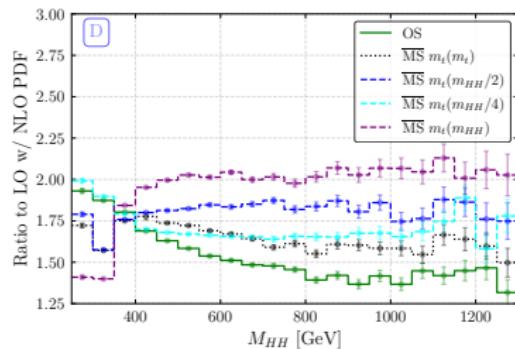

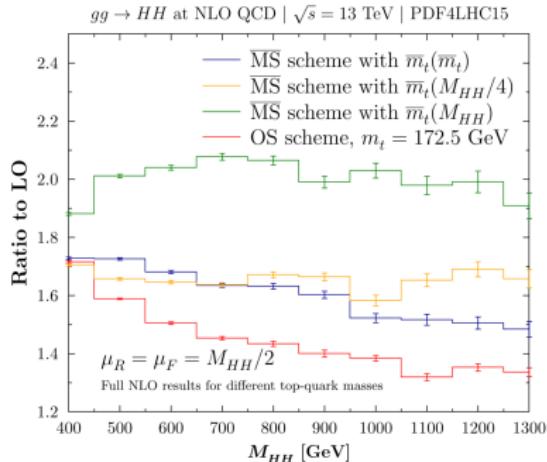

- Absolute distributions for different top mass schemes
  - Different top mass scheme → tilt of the distribution around the peak
  - Largest effect for  $m_t(M_{HH})$
- Ratio to the OS prediction at NLO

# SM top scheme dependence: $M_{HH}$

- K-factor for various scheme choices
  - Smallest k-factor for the OS above the peak
  - Largest k-factor for the  $\overline{\text{MS}}$  scheme and  $m_t(m_{HH})$
- Ratio to LO while using the same PDFs and  $\alpha_s$  → highlight the difference in the ME (cfr. 2008.11626)

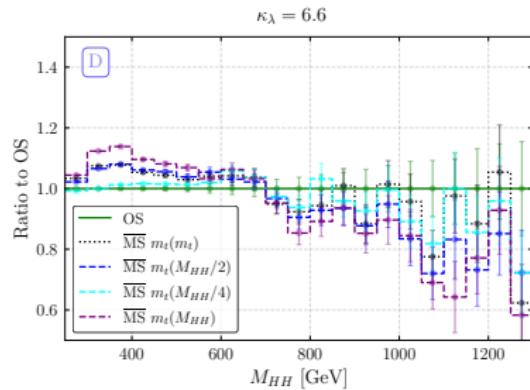

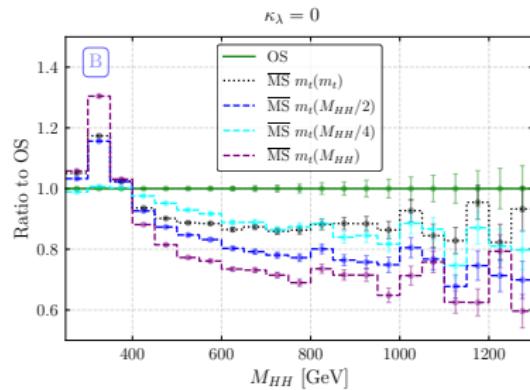

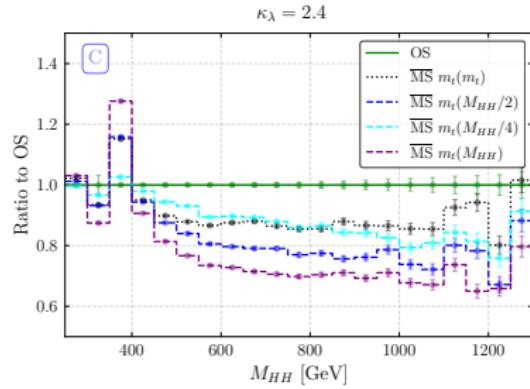

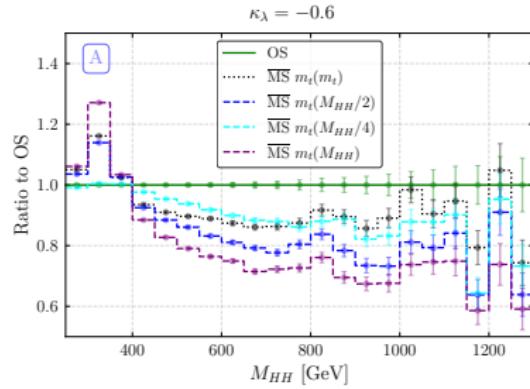

# SM top scheme dependence: $M_{HH}$

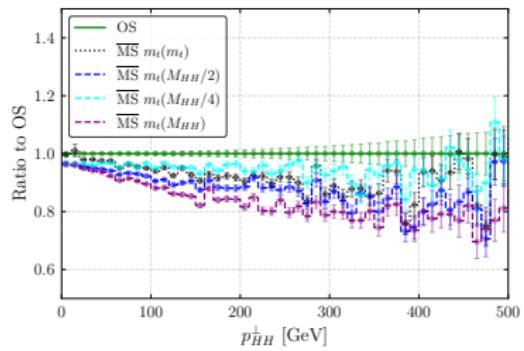

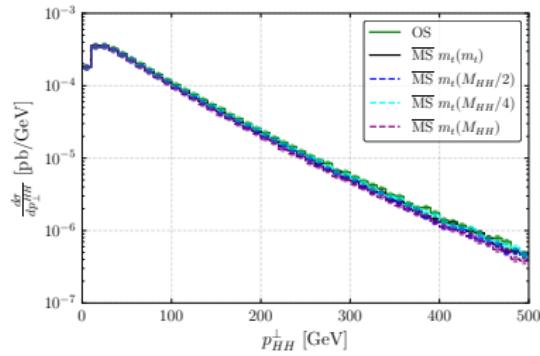

[Baglio et al., PRD 103 (2021) 5, 056002, hep-ph/2008.11626]

- Very good agreement even if the setup is different (NLO vs NLO+PS)

# Top scheme dependence with a modified trilinear

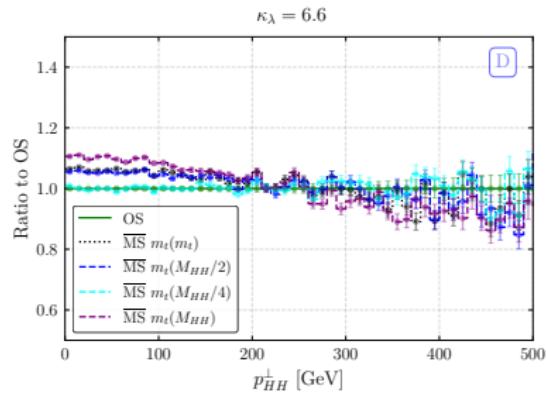

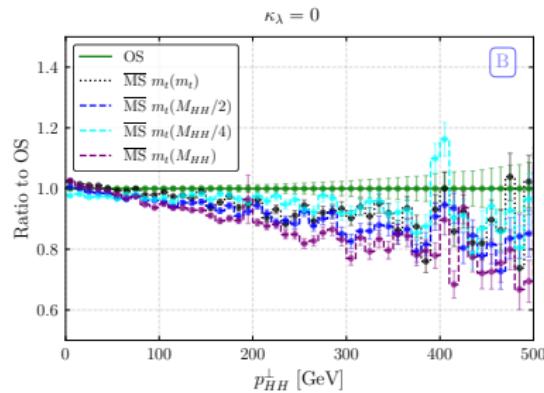

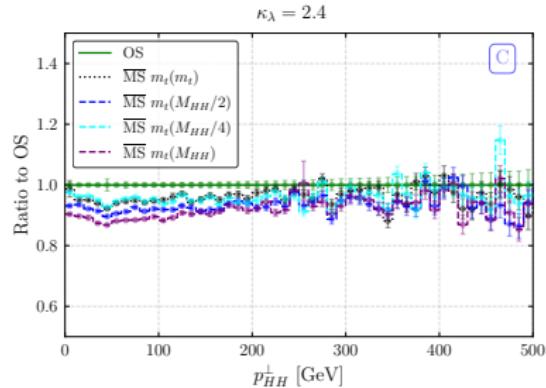

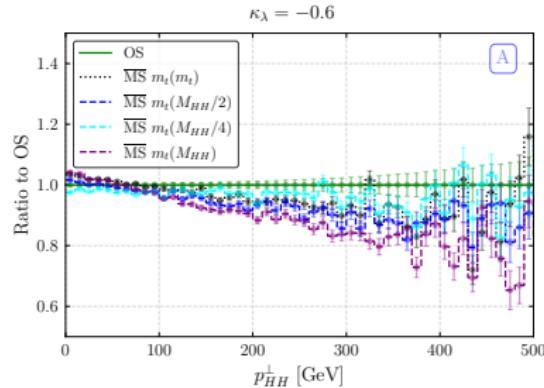

# Transverse momentum distribution of the Higgs pair

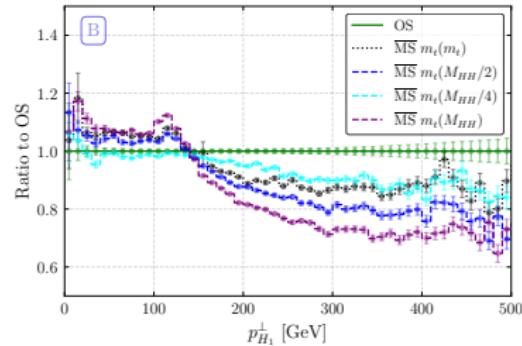

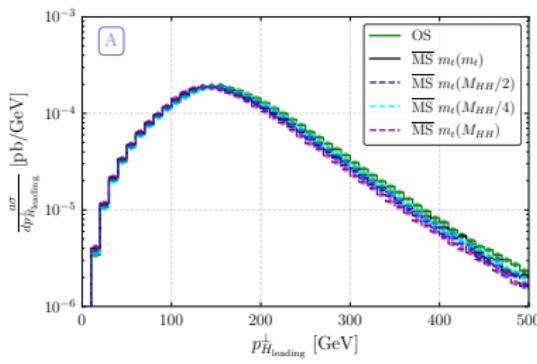

- Absolute distributions for different top mass schemes
  - Different top mass scheme → different slope of the  $p_{HH}$  distribution
  - Largest effect for  $m_t(M_{HH})$
- Ratio to the OS prediction at NLO

# Top scheme dependence with a modified trilinear

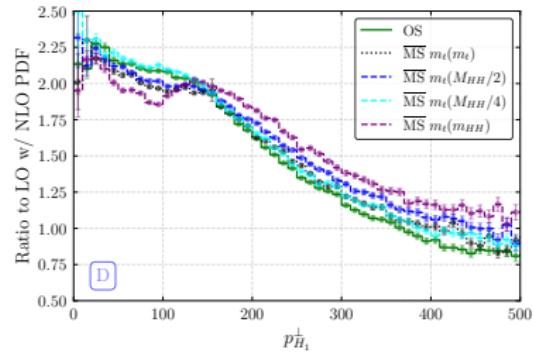

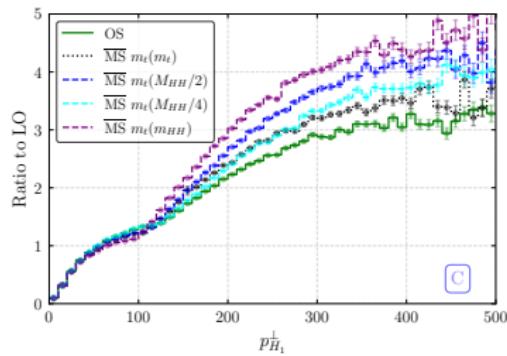

# $p_{H_1}^\perp$ in the SM

- Absolute distributions for different top mass schemes
- Ratio to the OS prediction at NLO
- Different top mass scheme → different slope of the  $p_{H_1}$  distribution above the threshold
- Largest effect for  $m_t(M_{HH})$

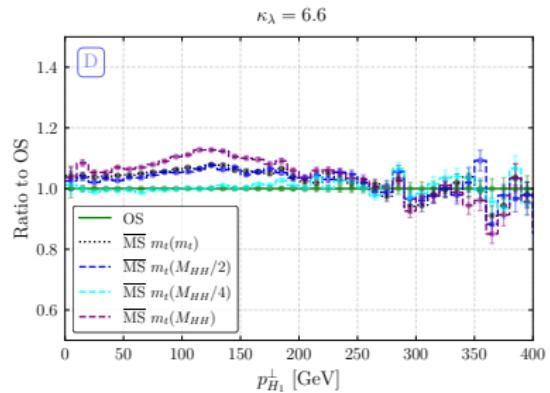

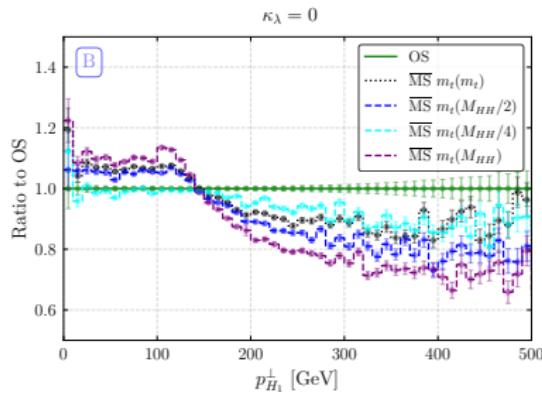

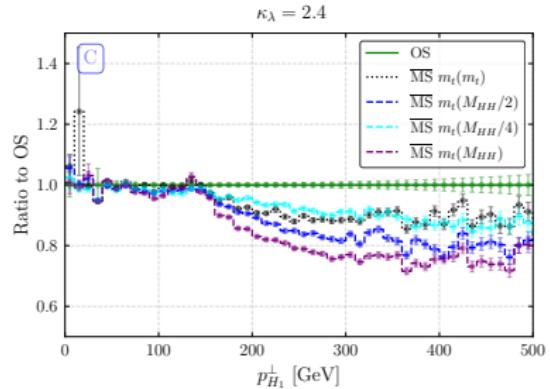

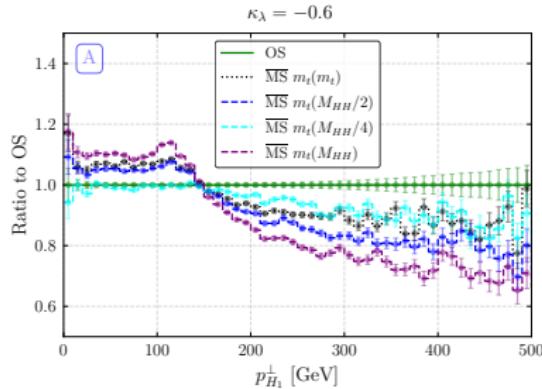

# $p_{H_1}^\perp$ in the SM

- K-factor for various scheme choices

- Ratio to LO while using the same PDFs and  $\alpha_S$  → highlight the difference in the ME (cfr. 2008.11626)

# Top scheme dependence for $p_{H_1}^\perp$

# Outlook

- We have developed a new Monte Carlo event generator in the **POWHEG-BOX** framework that includes the possibility of varying the trilinear coupling of the Higgs and the input parameters
- Gives the possibility of studying the uncertainty from the top mass scheme directly at the analysis level
- It will be made available in the **POWHEG-BOX** svn repository
- Future developments: possibility of rescaling the top Yukawa coupling; production of  $HH$  via an heavy resonance
