

System-on-Module survey report

Adrian Byszuk

On behalf of SoC Interest Group

<https://twiki.cern.ch/twiki/bin/view/SystemOnChip/WebHome>

24 May 2023

- Taken during April and May 2022 among the members of the SoC Interest Group
- Multitude of questions: do you use/plan to use SoM, what type, number of modules, applications, requirements, challenges, wishlist
- 26 responses from the whole CERN
- After careful analysis, survey report is now ready!
- The full report CERN-OPEN-2023-001 can be found here: <http://cds.cern.ch/record/2847967>

Do you use/plan to use SoM?

Use/Plan to Use SoM

- Presented here are general conclusions
- More detailed analysis available in the report

When and how many modules?

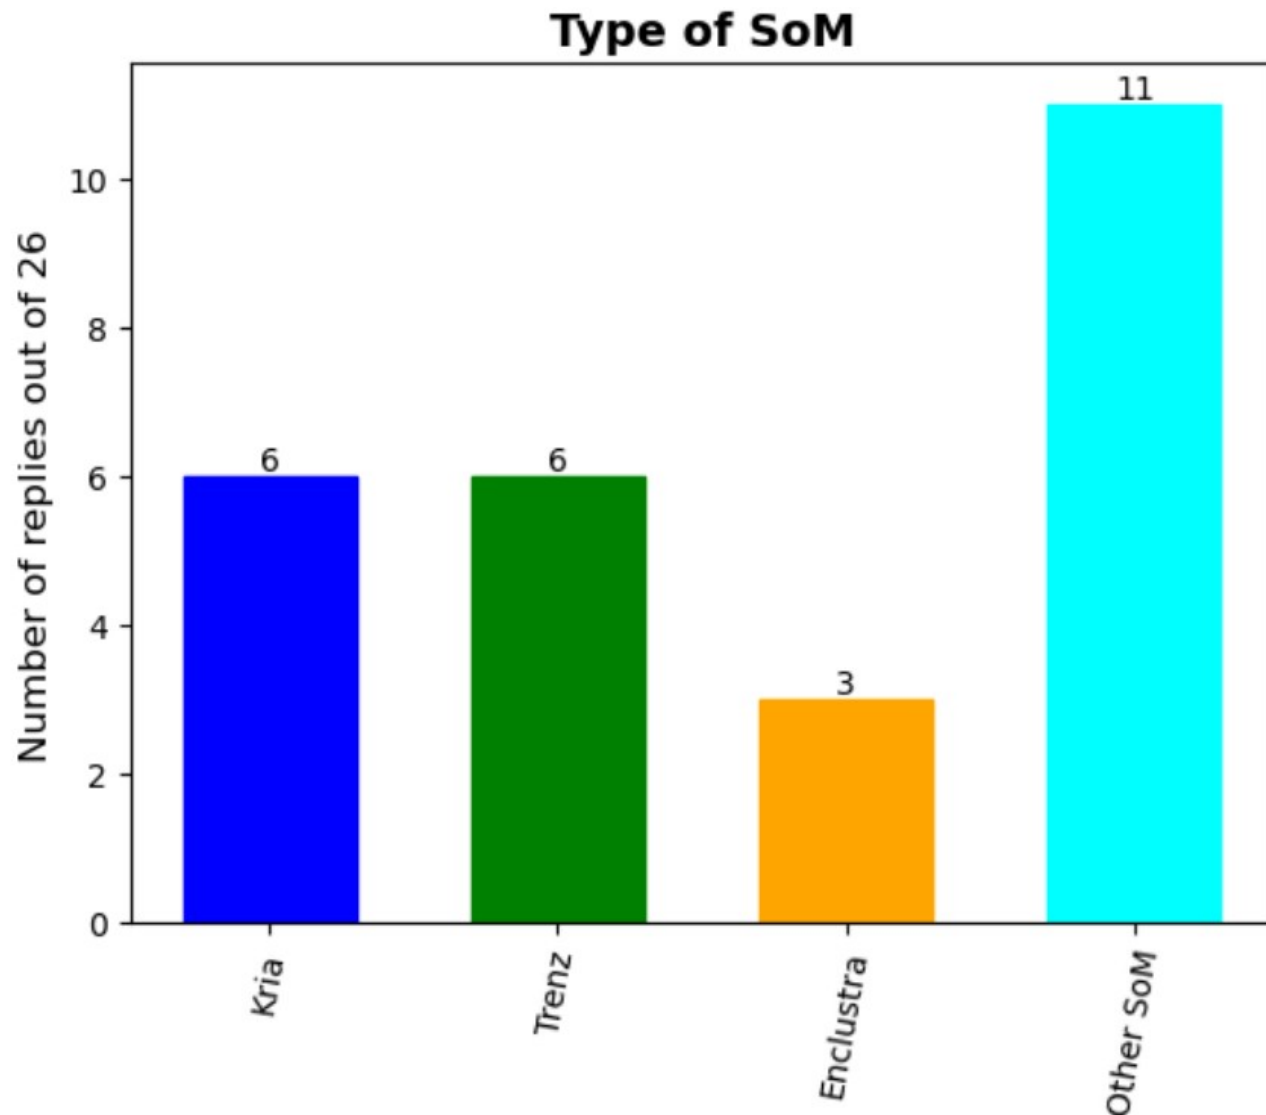

Schedule of Use of SoM

Number of SoM

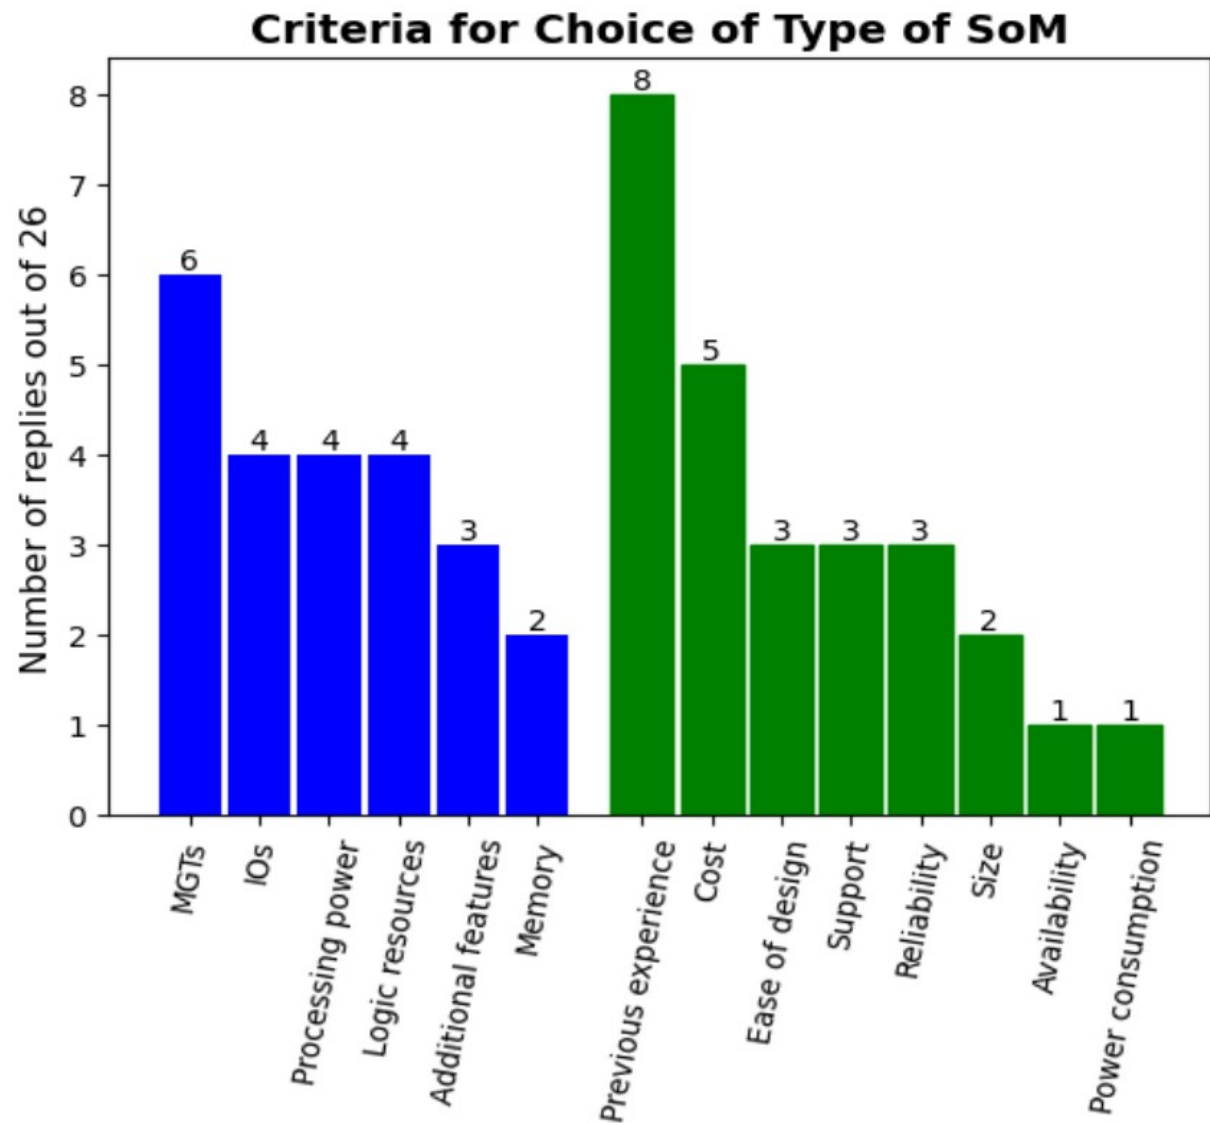

SoM vendors

Other vendors:

- Ultrazed-EV from AVNET
- Aldec
- Iwave Systems
- MyIR Tech Systems
- Miami Zynq from TOPIC Embedded Systems
- University of Wisconsin-Madison

SoM vendors

- Technical and non-technical reasons
- IO/MGT interfaces dominate technical criteria
- Previous experience and cost are very important factors
- Availability is not an issue

Use of SoM

Use of PL

Challenges

- Procurement was still a major obstacle in 2022
- Size and complexity of software stack is dominating over hardware
- 11 replies didn't mention any issues

SoC choice and motivation

Choice of SoC

Reasons for Choice of SoC

Gigabit transceivers

Minimum Number of MGTs

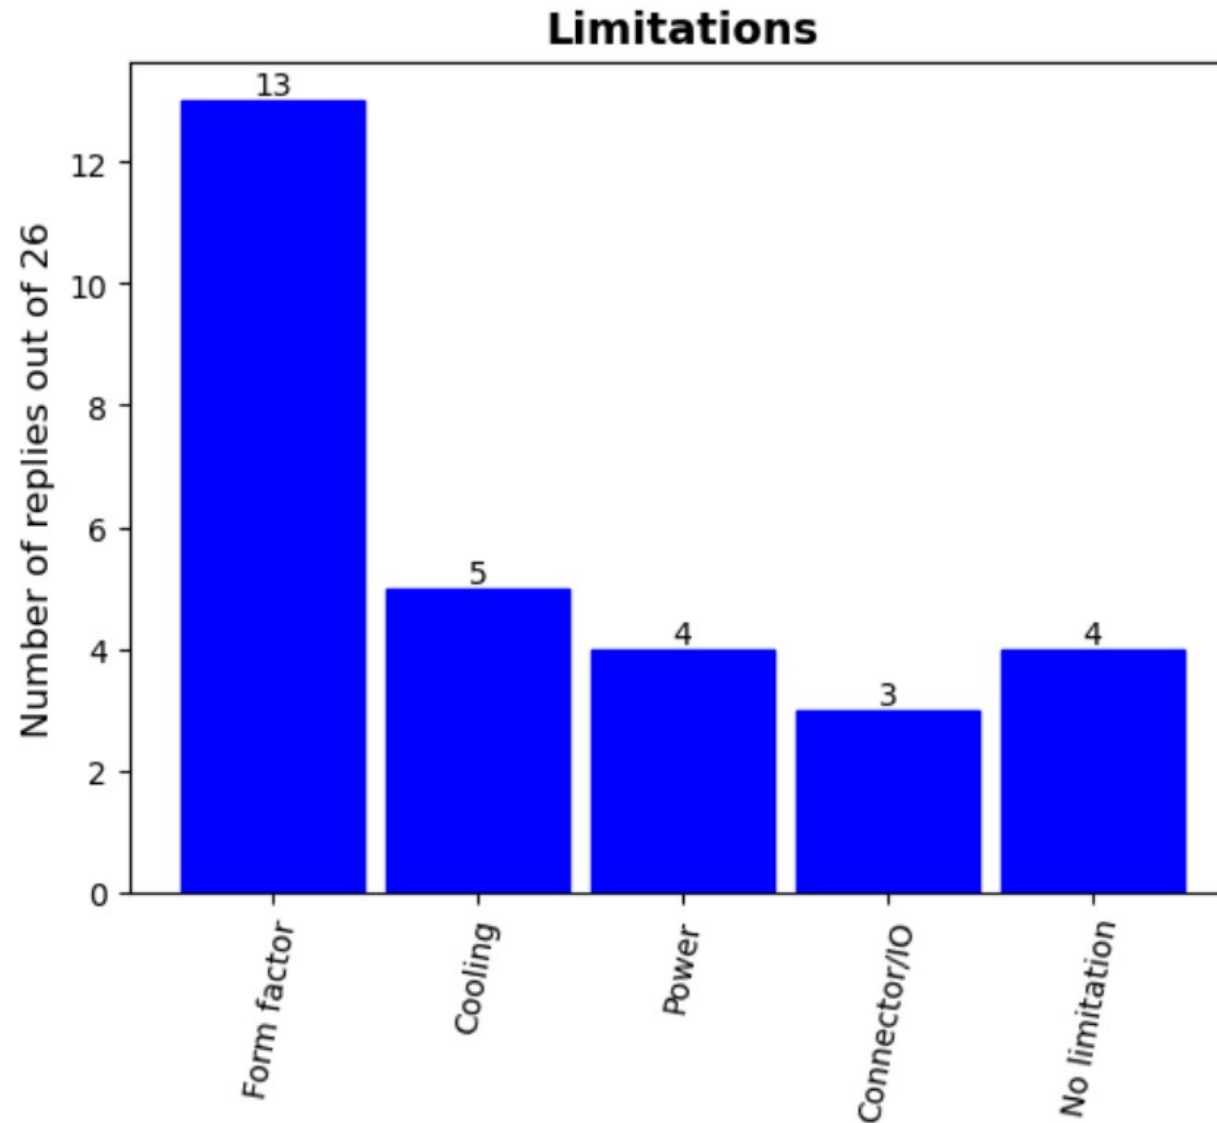

Reason for Type of MGTs

Operating system choice and requirements

- Everyone uses or plans to use Linux on regular Cortex-A cores
- Petalinux and/or CentOS are the popular choice
- A few projects have a need for real-time control, possibly with Cortex-R5 cores
- Different interpretations of real-time: from FreeRTOS, through bare-metal software to PL logic
- Out-of-the-box support for hardware was often mentioned (Xilinx IP, DMA, PMBus, some I2C devices)

Customer support

- Most people are satisfied with customer support (or didn't need one)
- Missing or incomplete board schematics from some vendors
- Missing long-term support and outdated example designs

SoM wish list

- Better clocking circuitry
- Common OS framework
- Bigger eMMC storage
- Connector standardisation
- Complete design examples
- More powerful processor and better PS-PL coupling (e.g. latency)
- PL DDR memory
- Integrated cooling, multiple boot options, integrated IPMC

Conclusions

- SoM popularity is rising
- All teams use Xilinx SoC, majority of SoMs are from Enclustra, Trenz or Xilinx
- Choice driven by previous experience, reasonable cost and good support
- Long term support is a concern, partially due to vendor lock-in (non-standard connectors)
- Everyone uses Linux, common OS framework would be welcome
- Connectivity is important, some interfaces are ubiquitous (Ethernet, I2C, SPI, UART, JTAG)

Thank you!

We'd like to thank everyone
who participated in the
survey!
