P-ONE

Outline

- Neutrino Astronomy & Particle Physics
- Neutrino Telescopes
- **P-ONE**
 - P-ONE Physics
 - P-ONE Site: Cascadia Basin
 - STRAW and STRAWb
 - P-ONE Physics & Canadian Activities

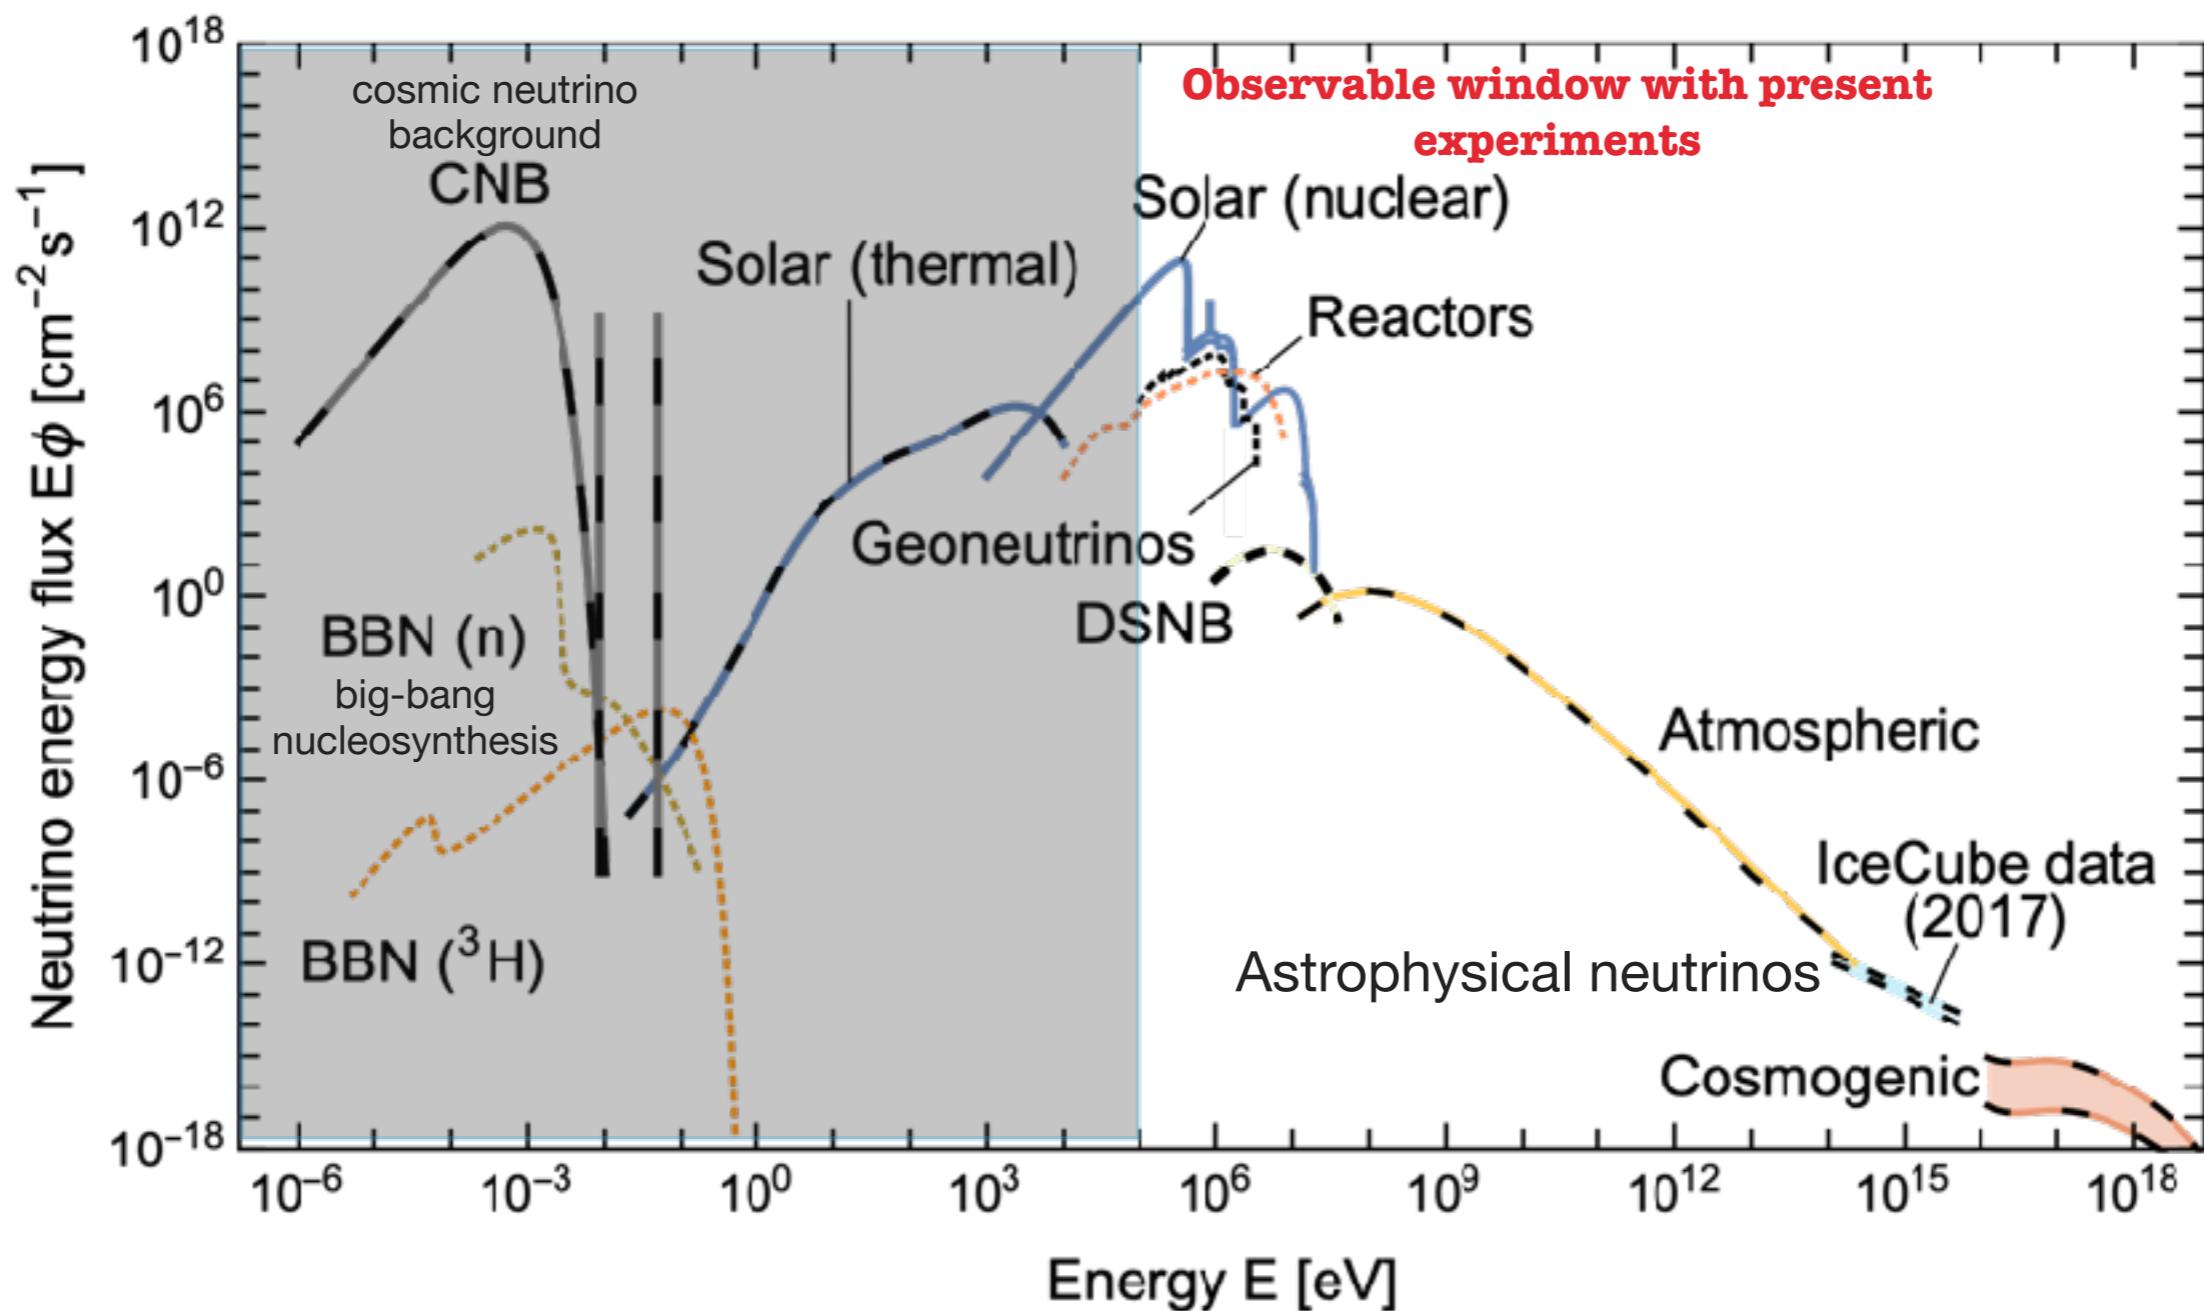

Neutrinos from the Universe

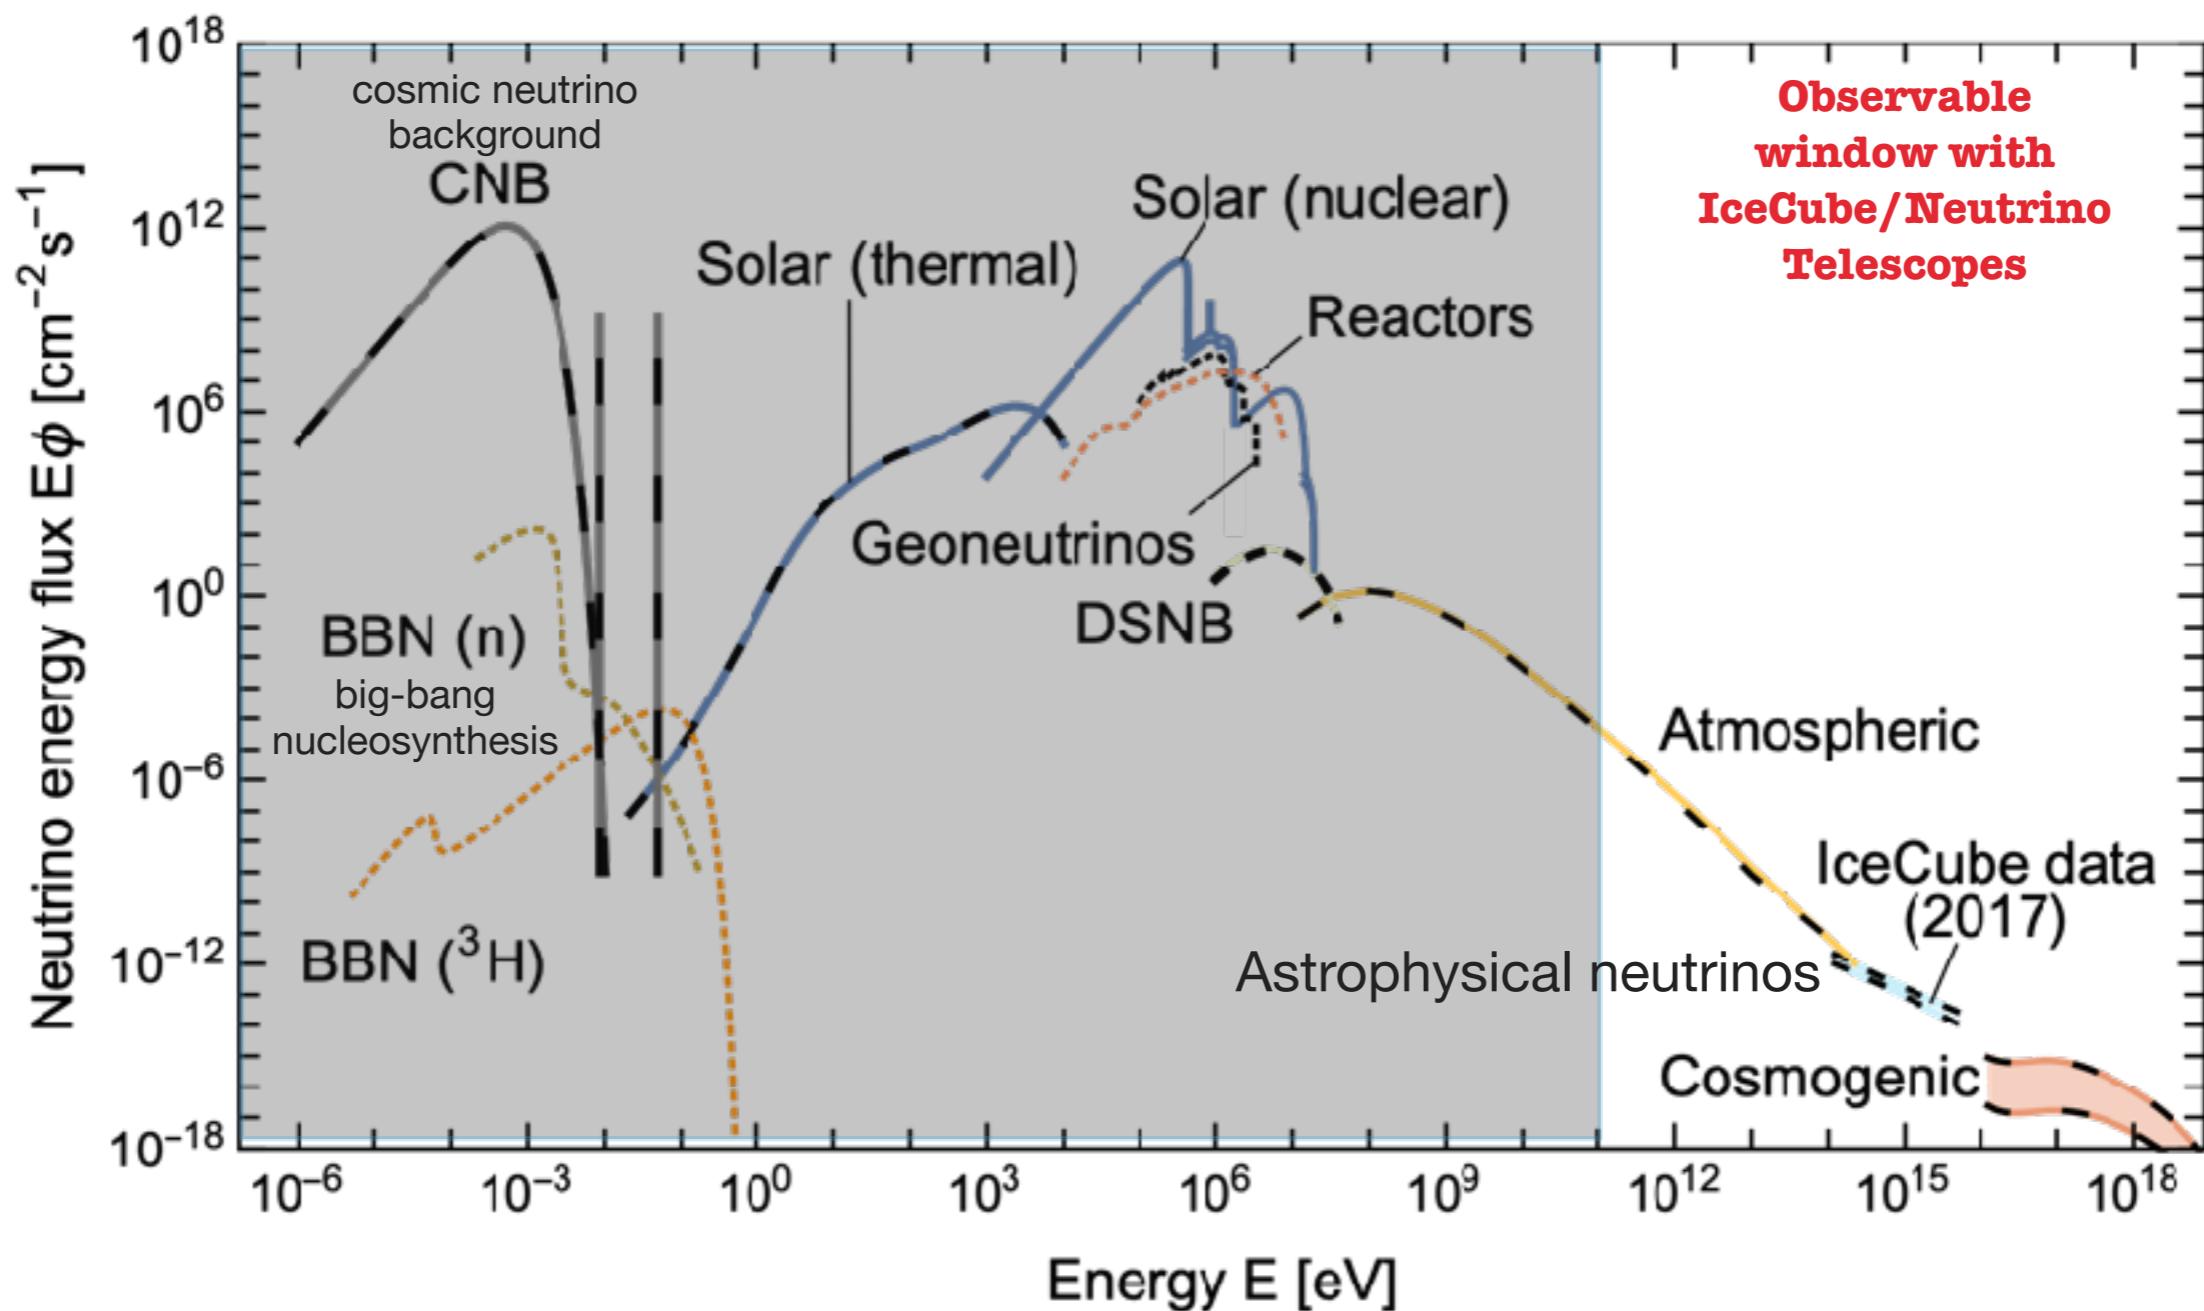

Grand Unified Neutrino Spectrum (GUNS) at Earth integrated over directions and flavours

Neutrinos from the Universe

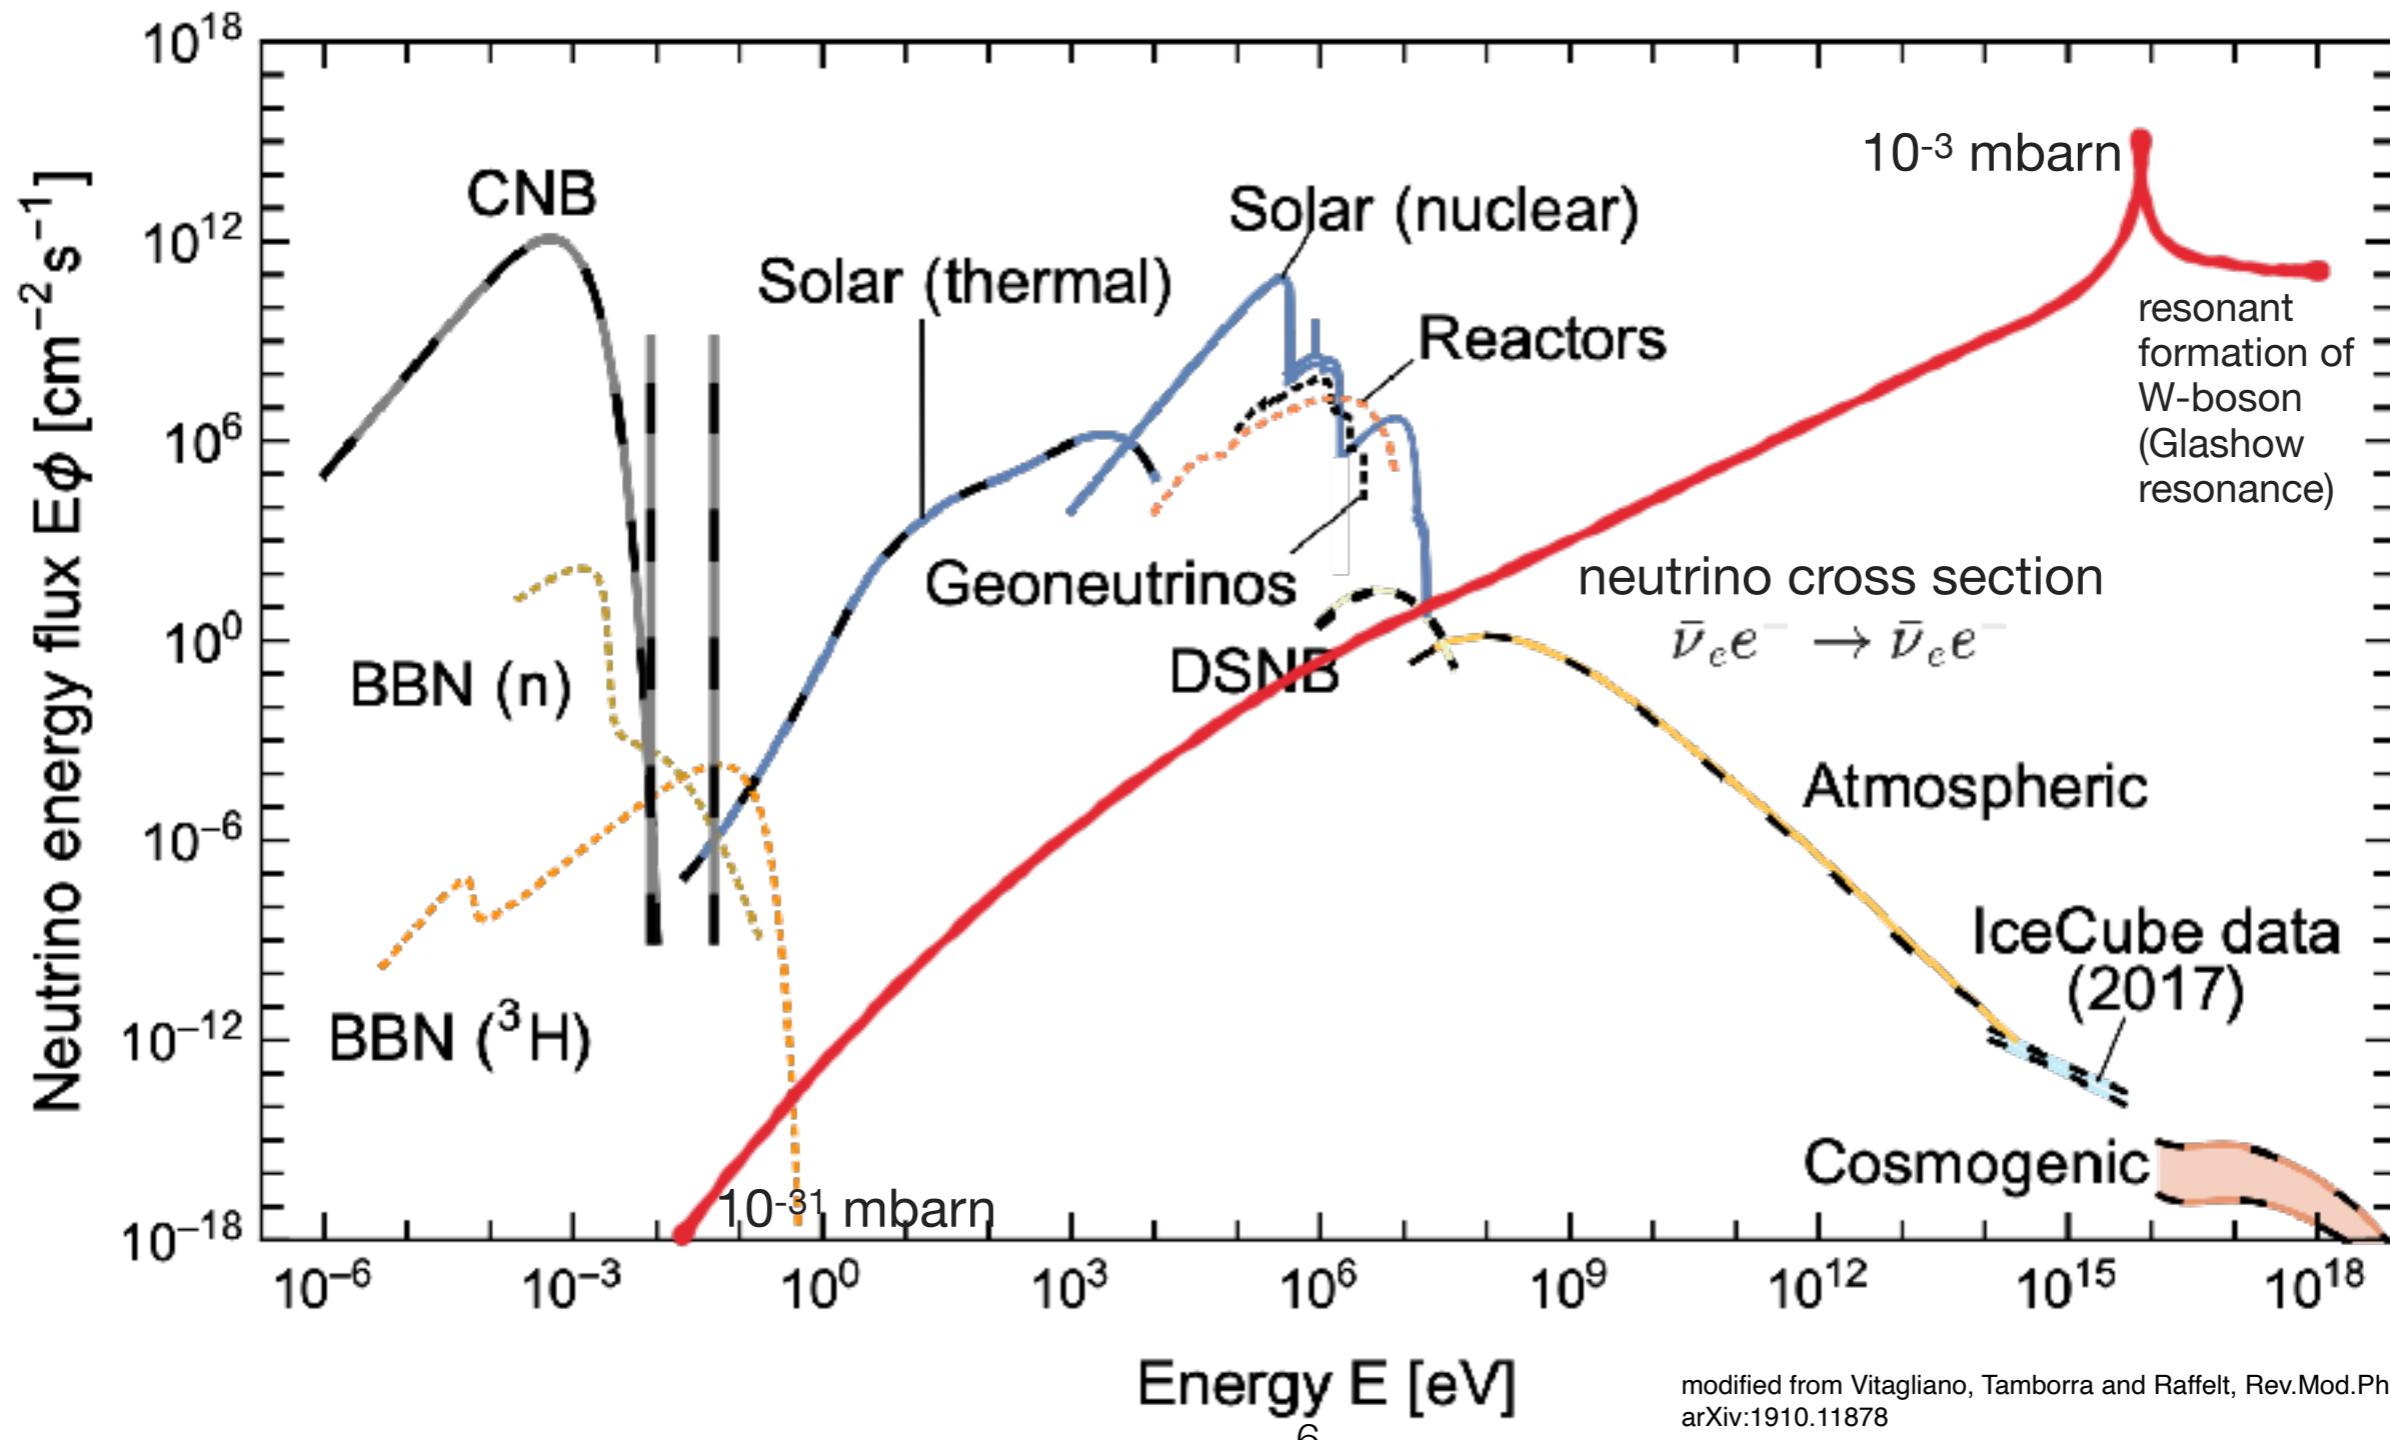

Grand Unified Neutrino Spectrum (GUNS) at Earth integrated over directions and flavours

Neutrinos from the Universe

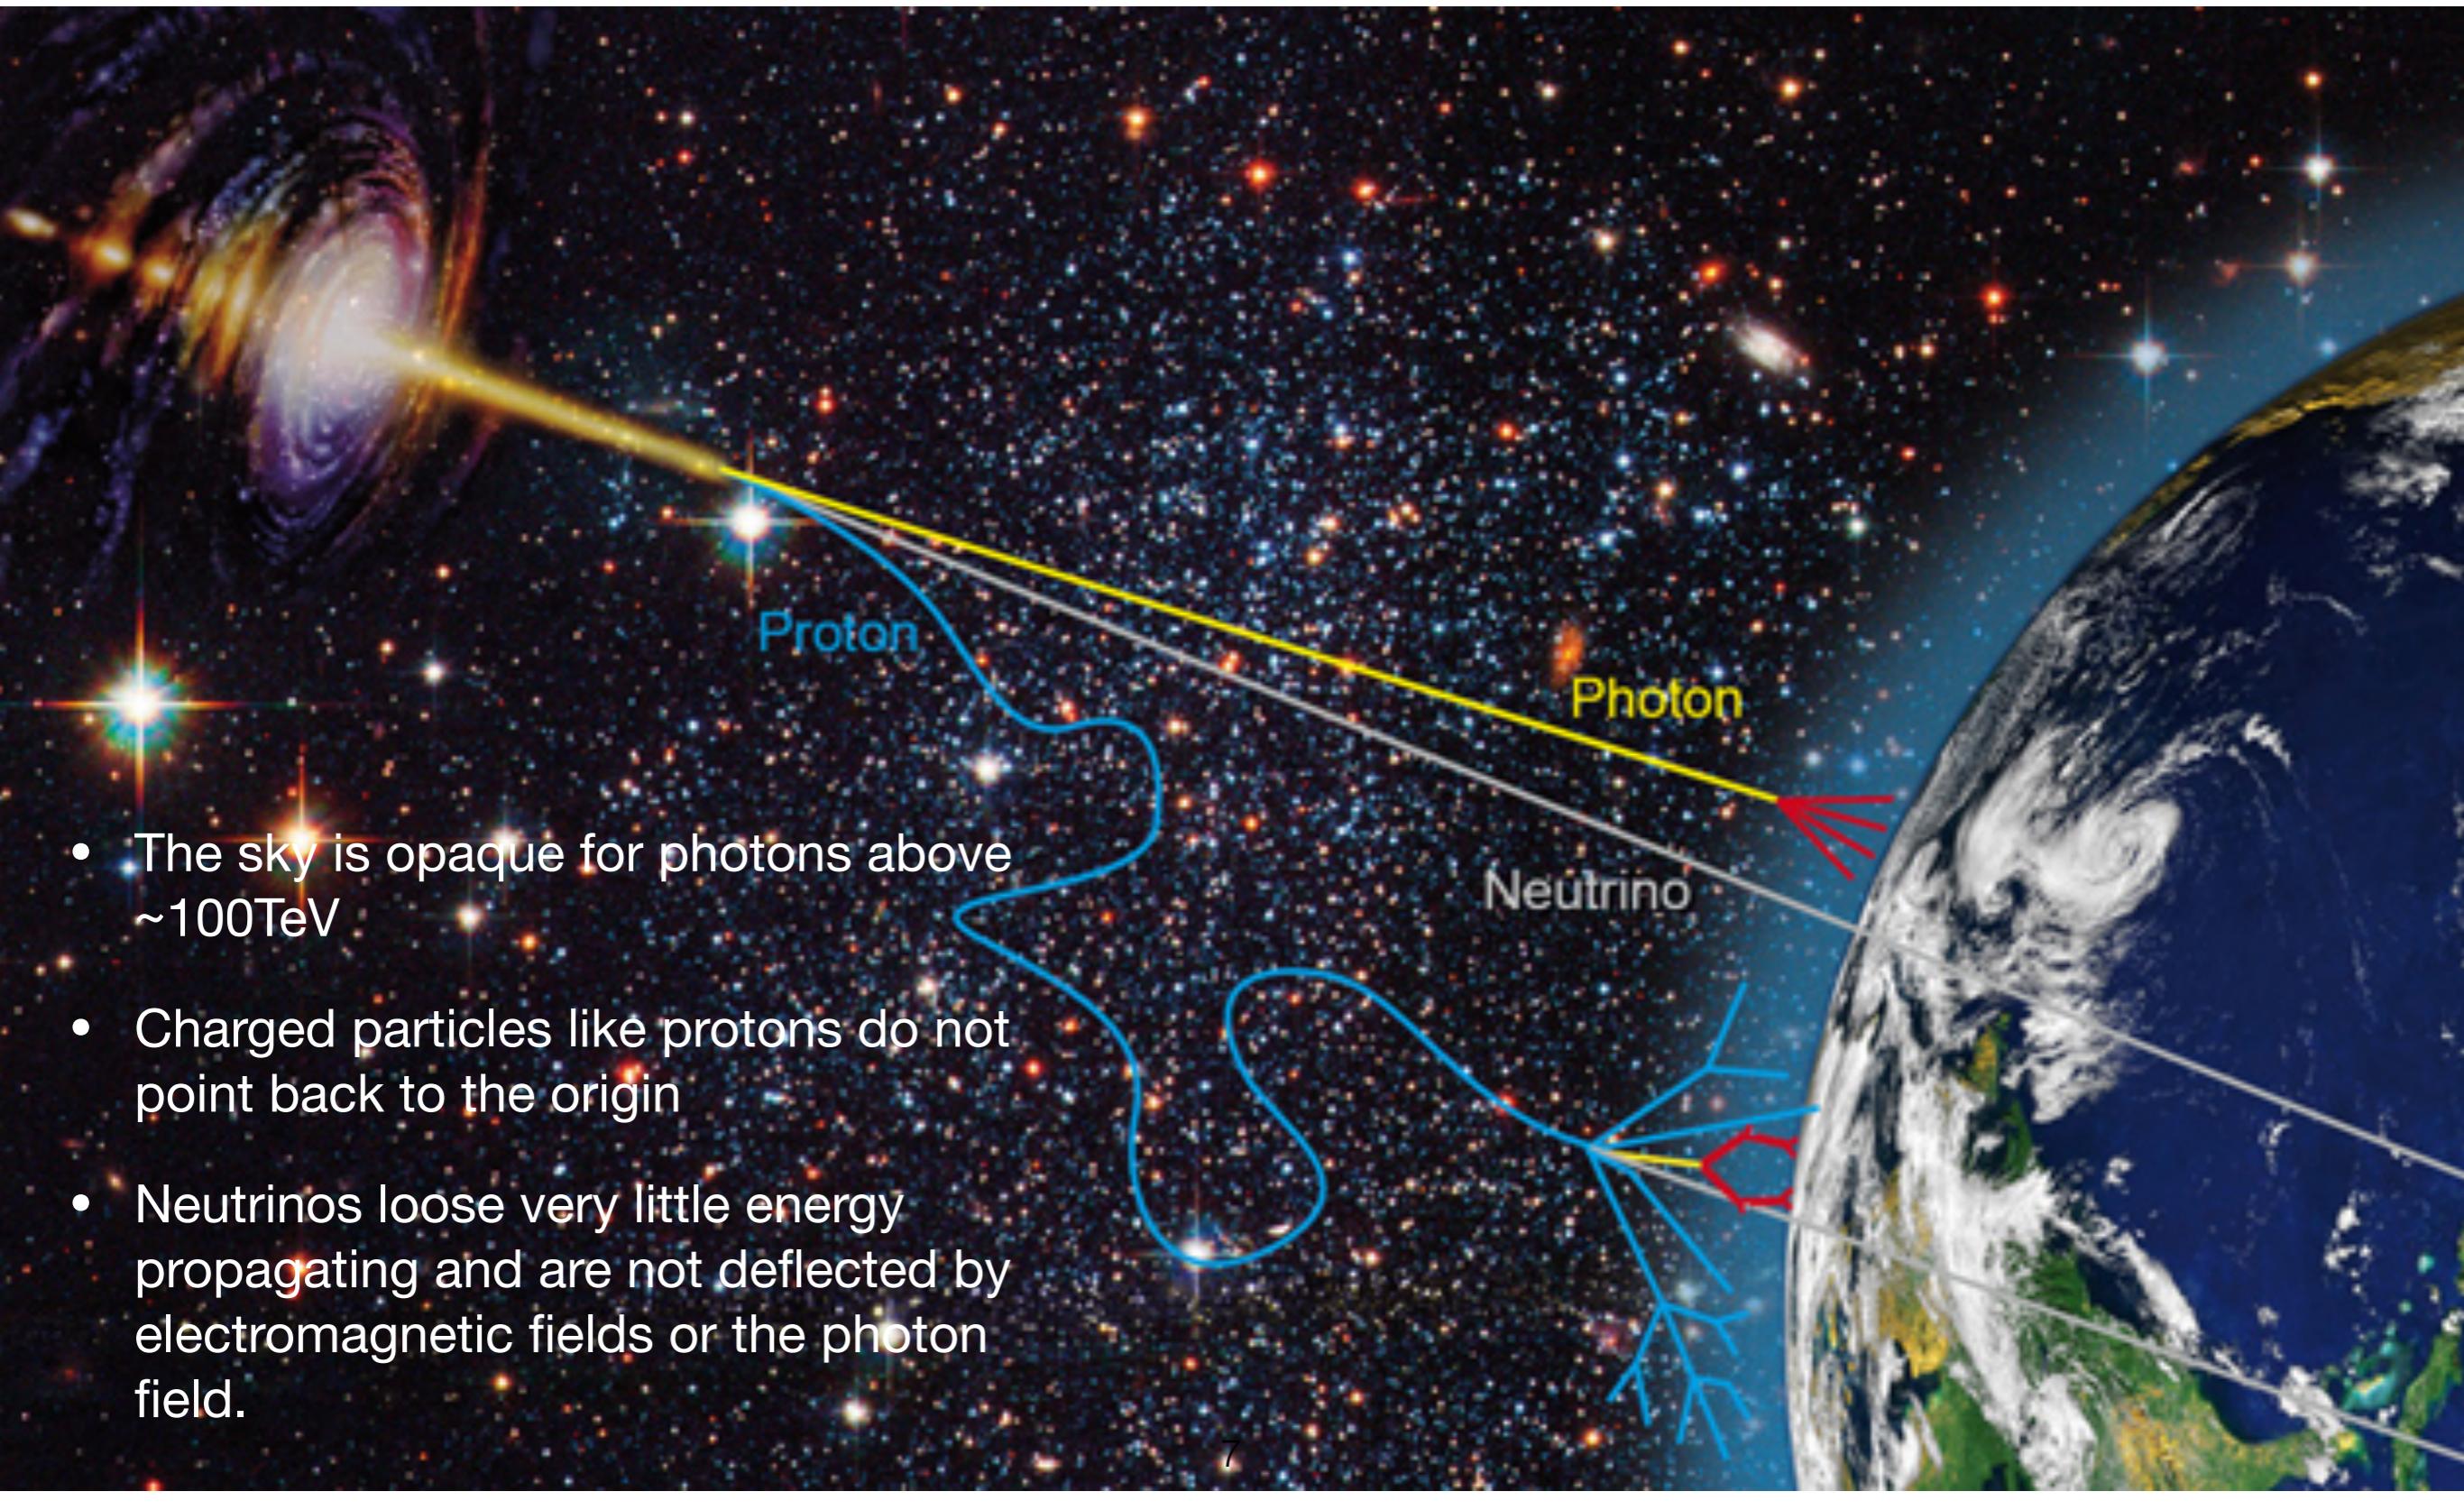

Grand Unified Neutrino Spectrum (GUNS) at Earth integrated over directions and flavours

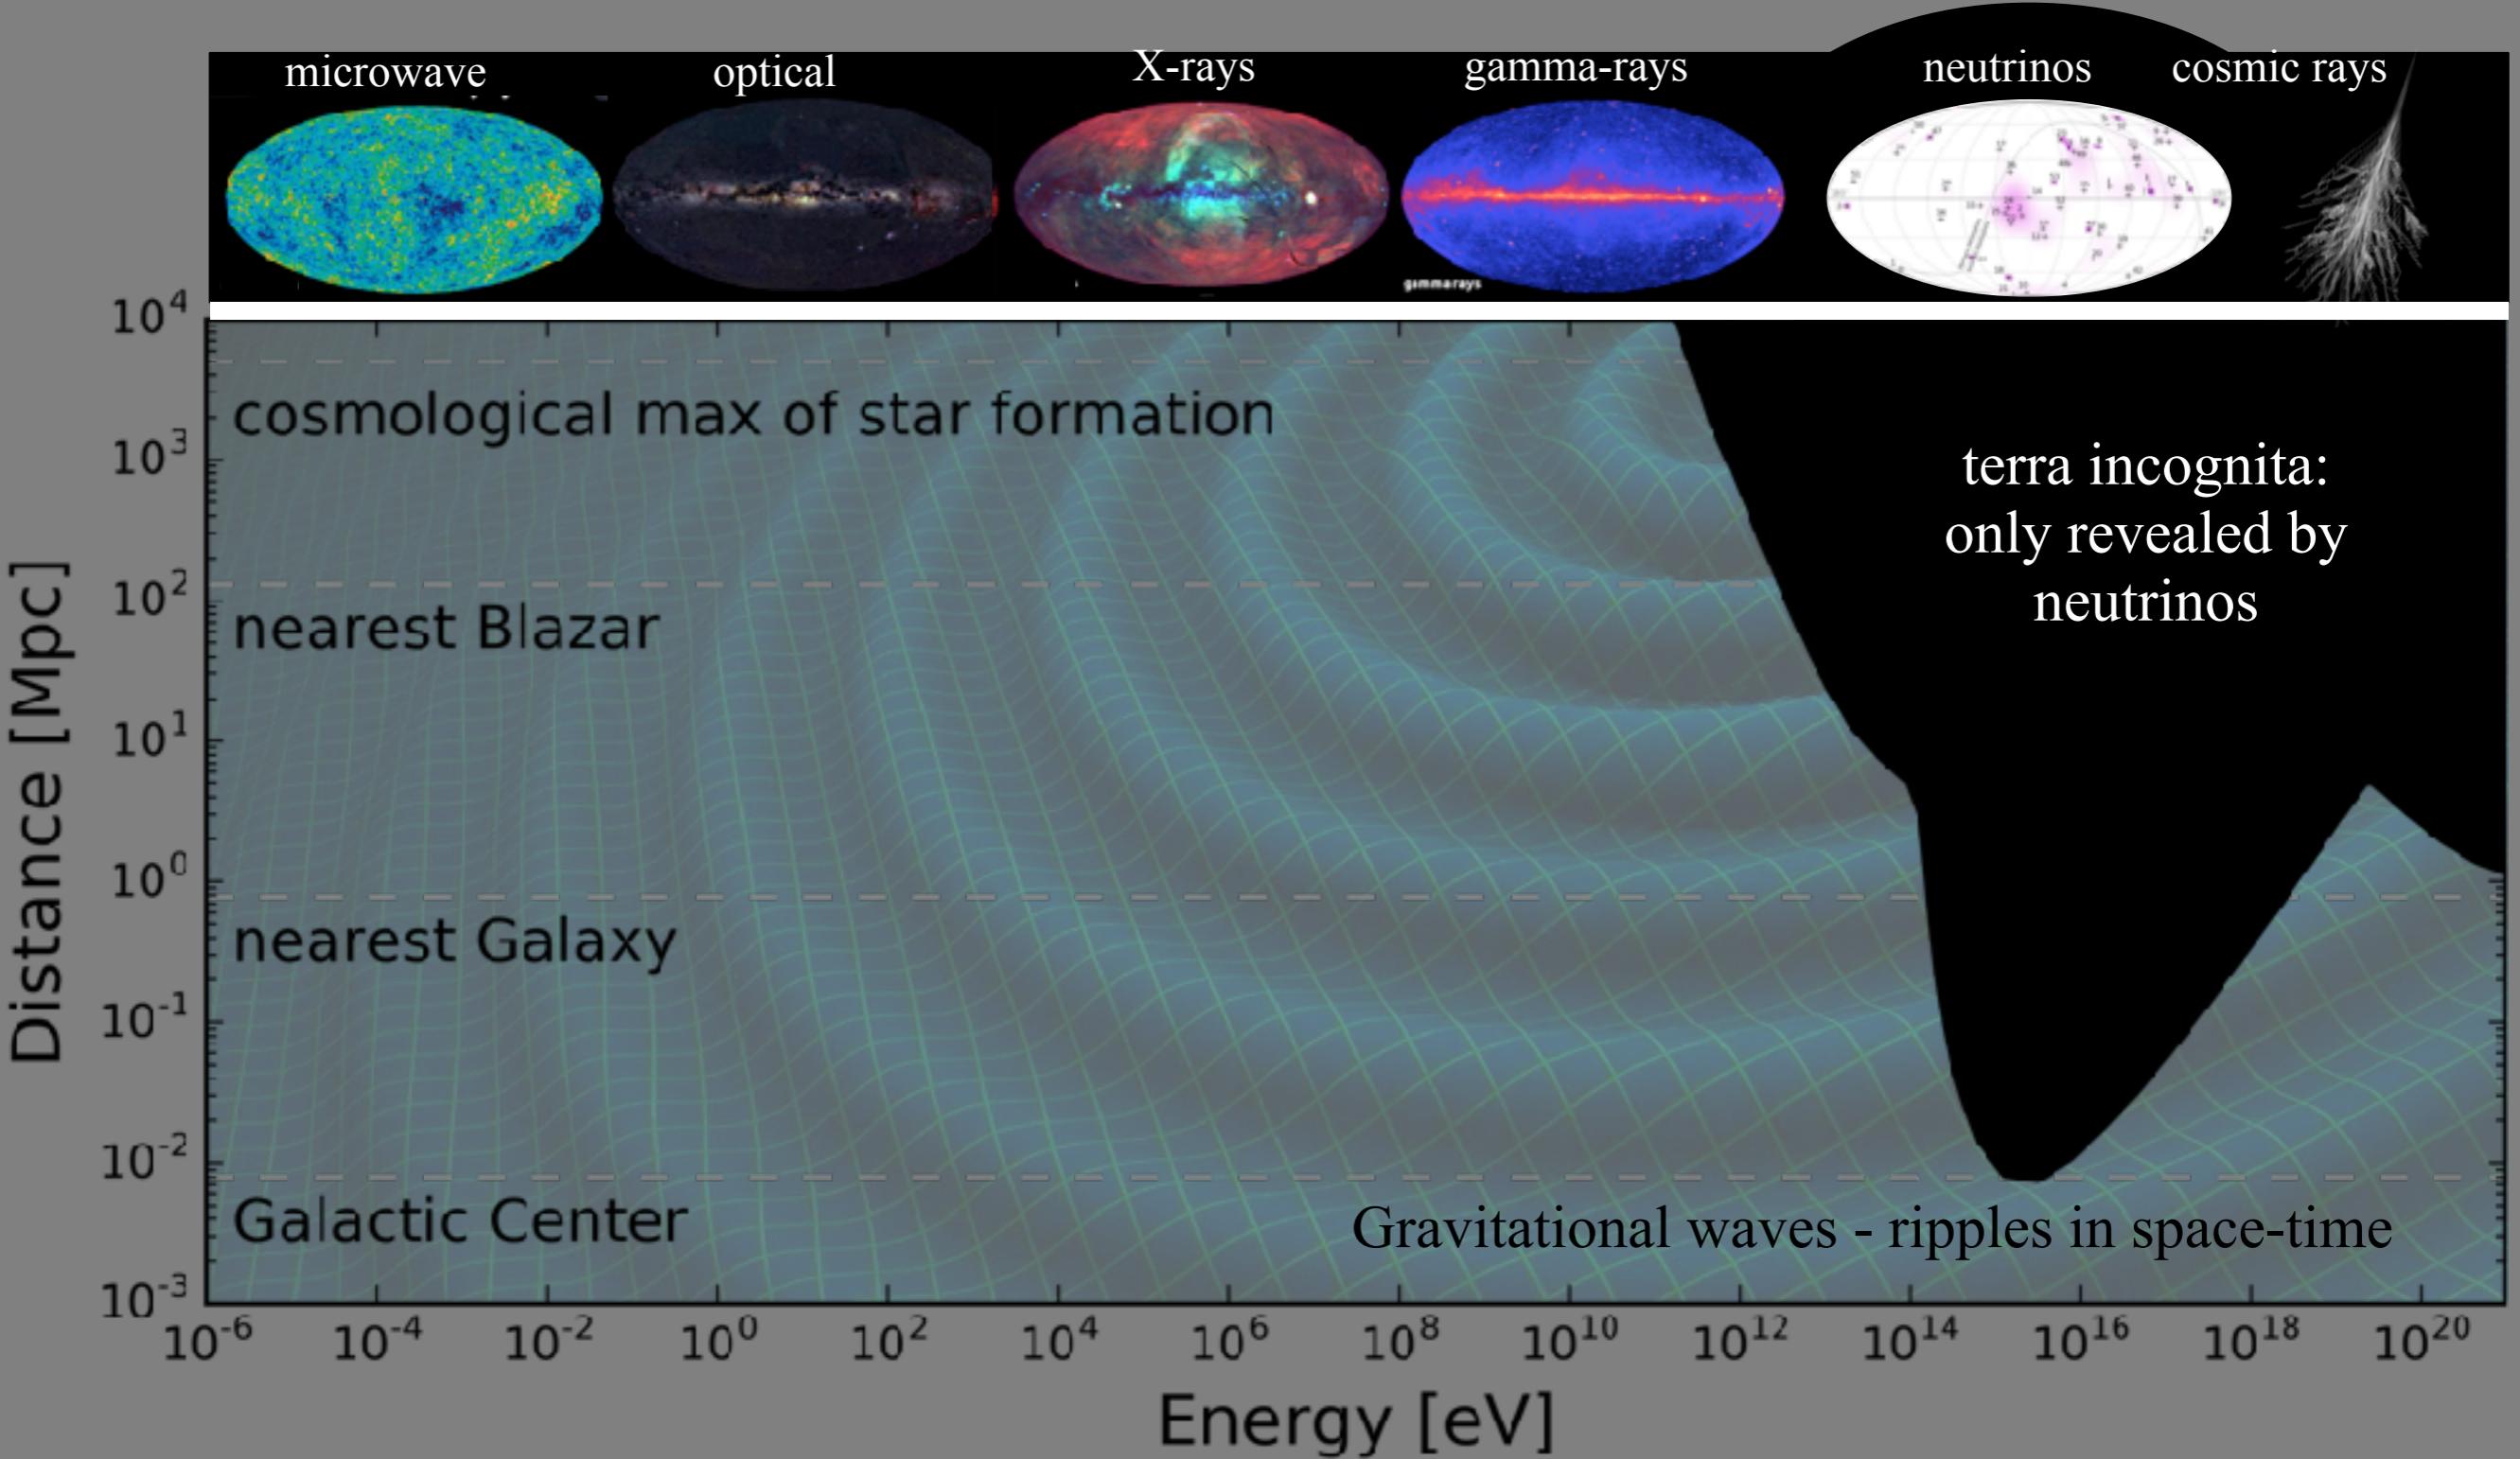

Neutrinos from the Universe

Neutrino Sources?

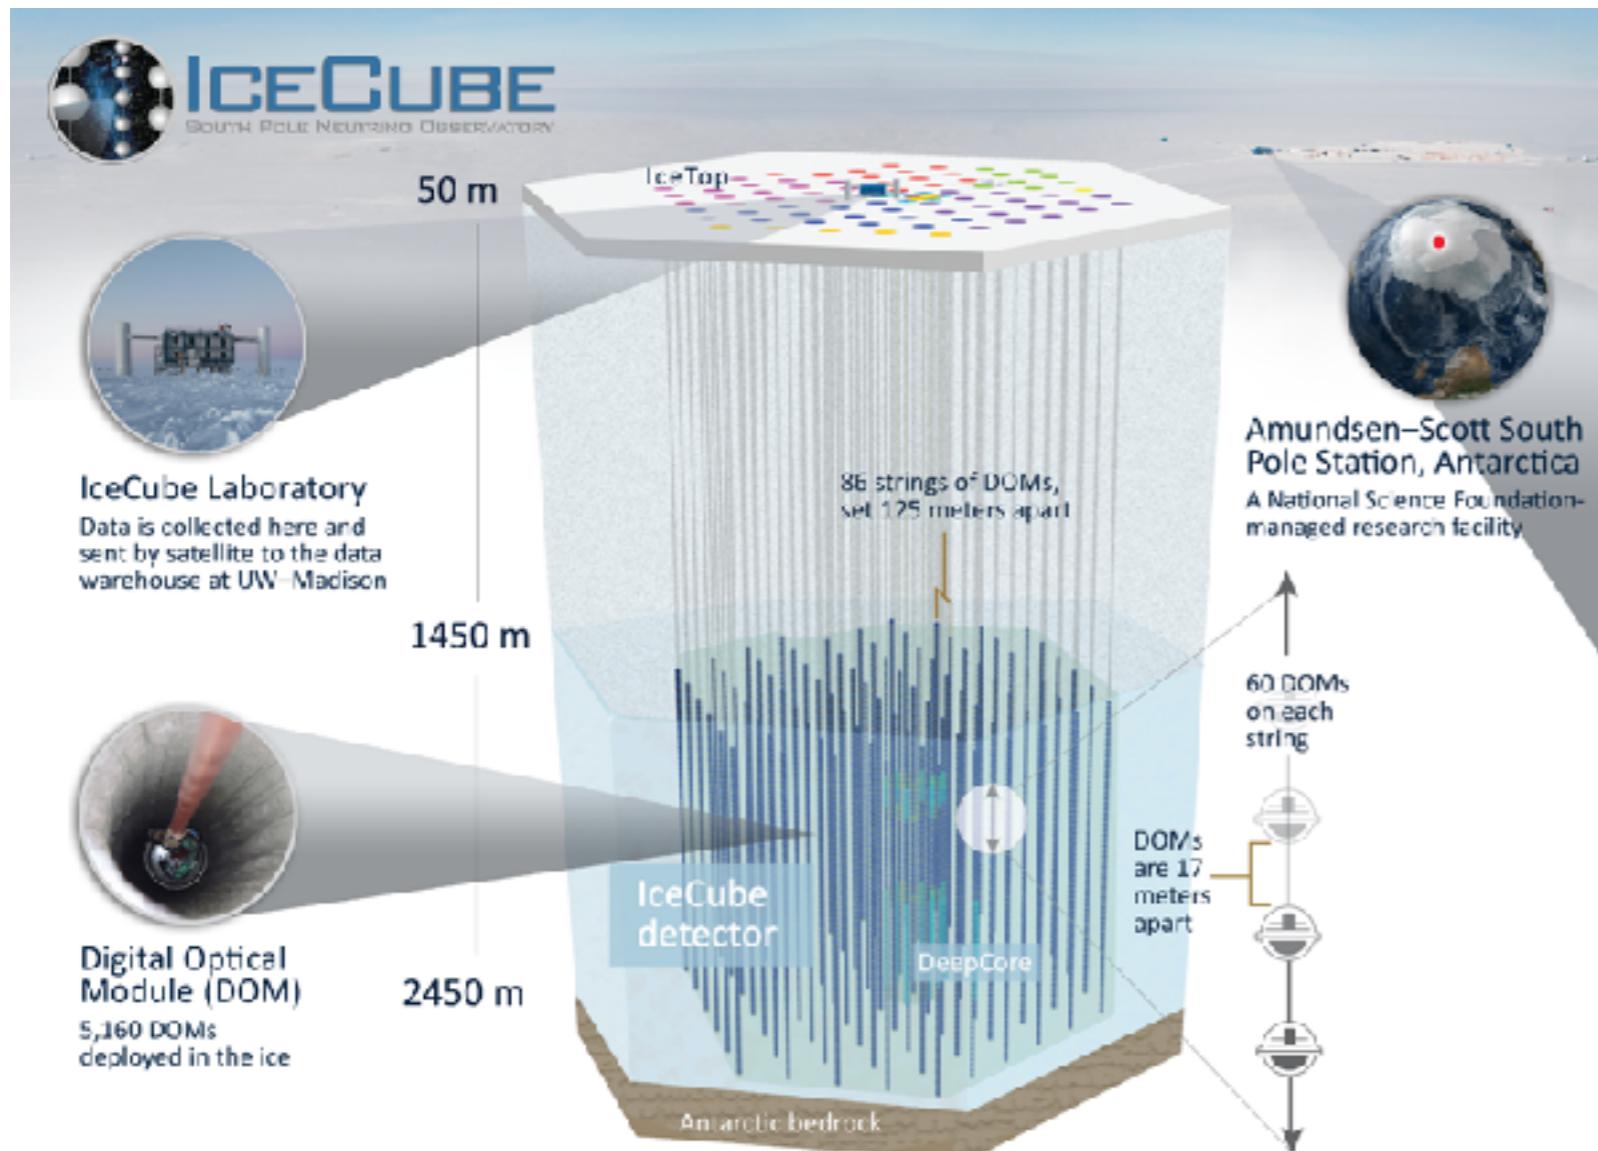

highest energy “radiation” from the Universe: neutrinos and cosmic rays

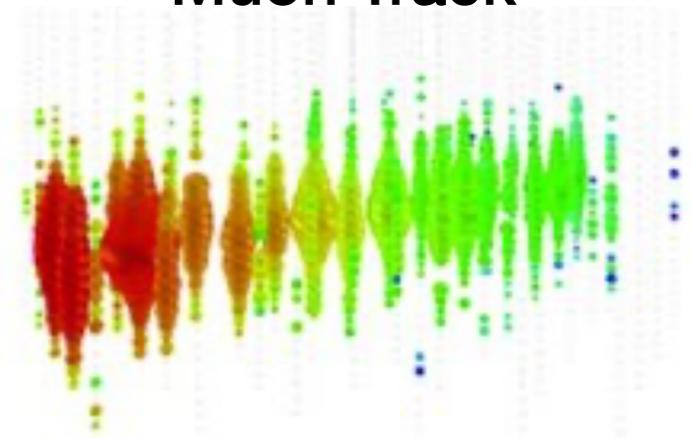

Universe is opaque above ~ 100 TeV energy

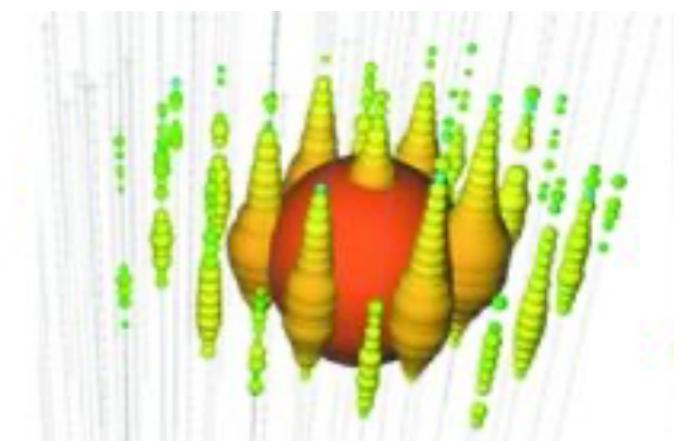

IceCube & DeepCore

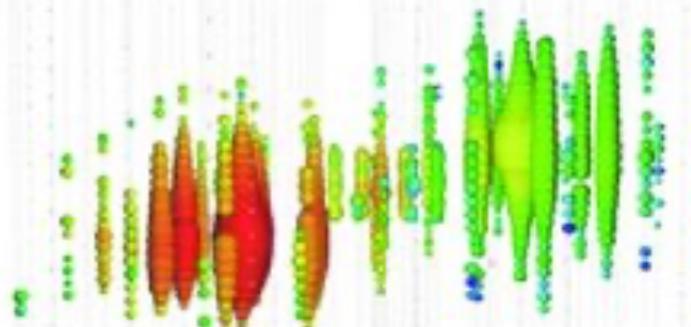

Muon Track

Electron Cascade

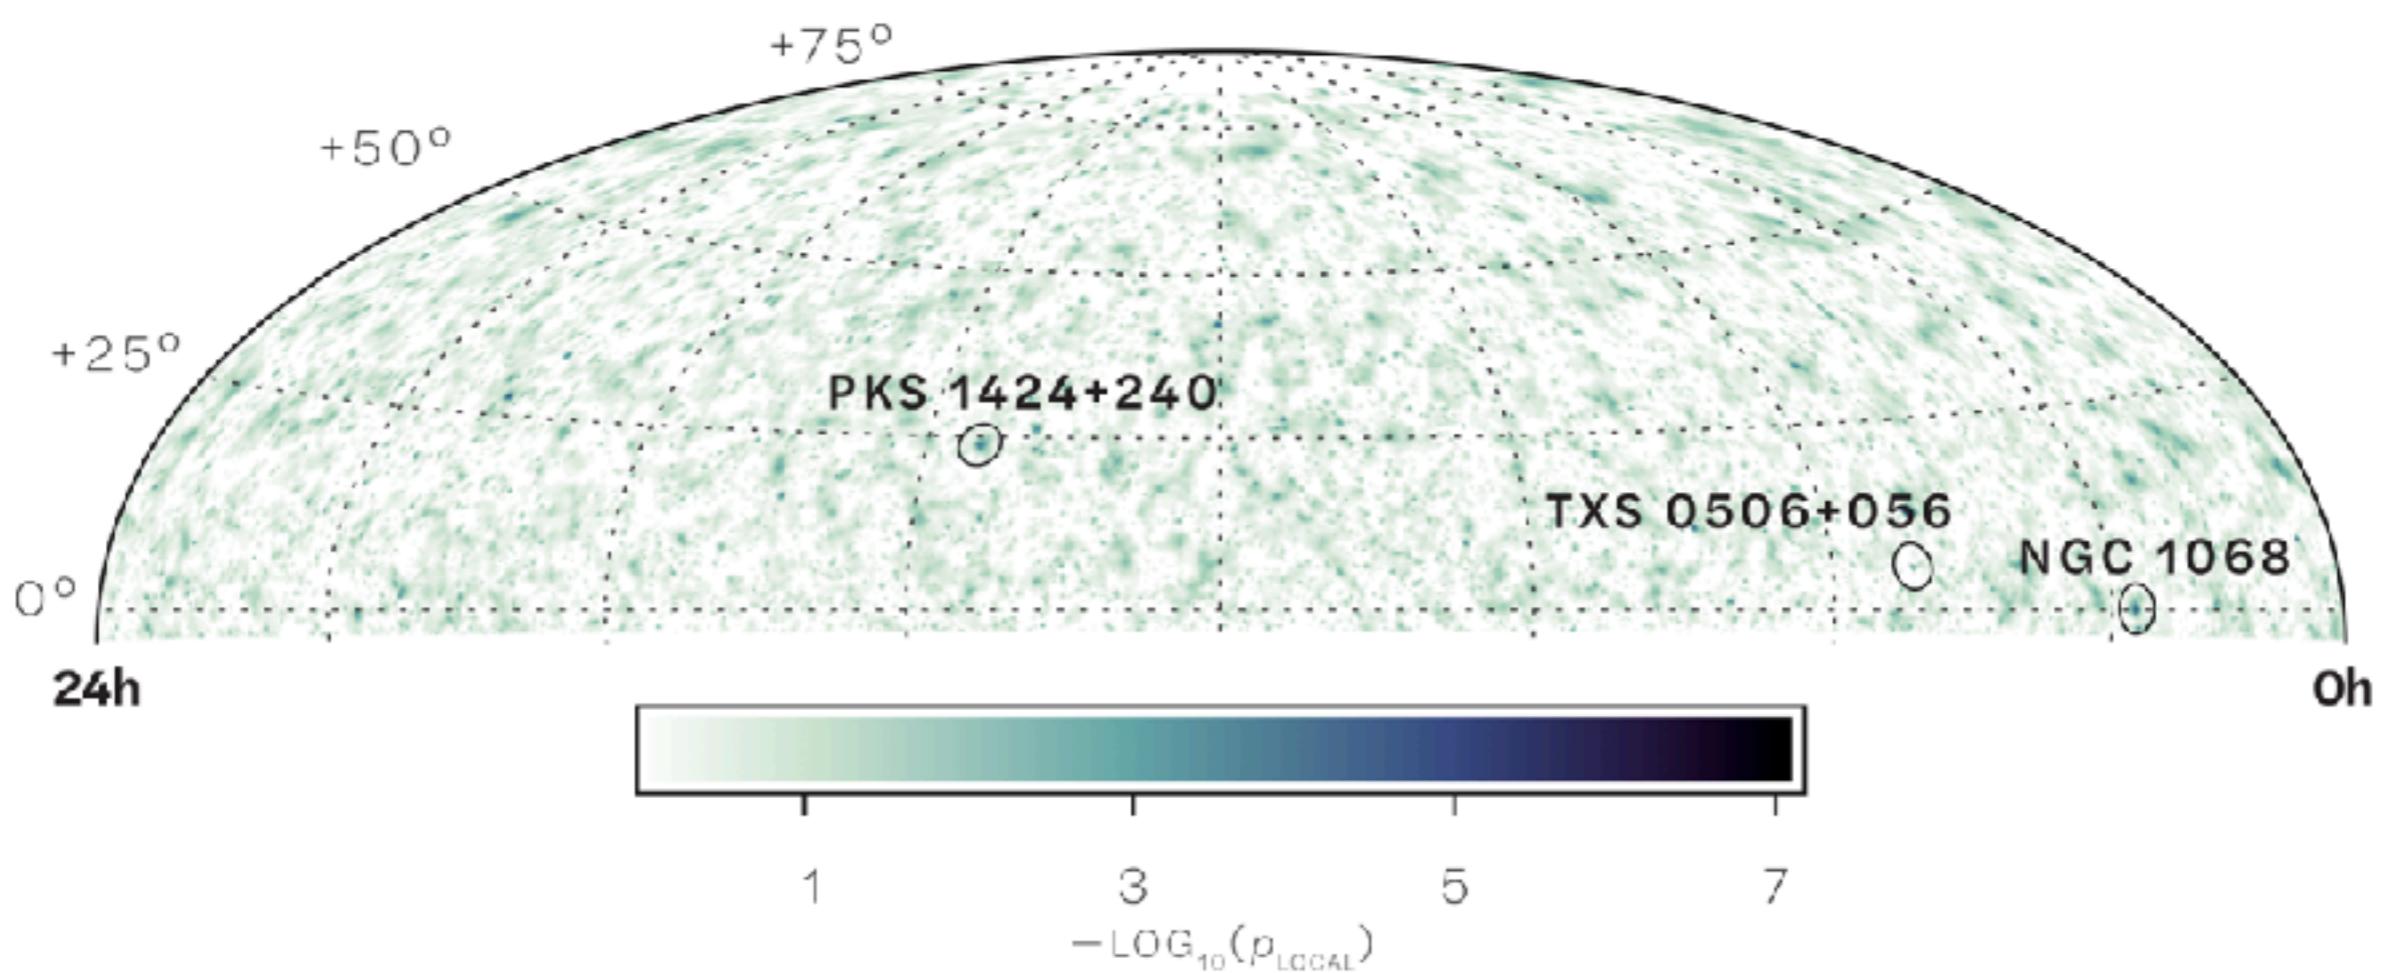

Tau “Double Bang”

- Completed in 2011

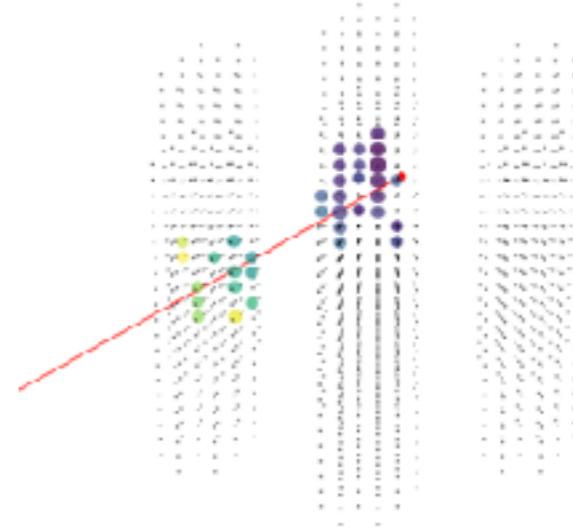

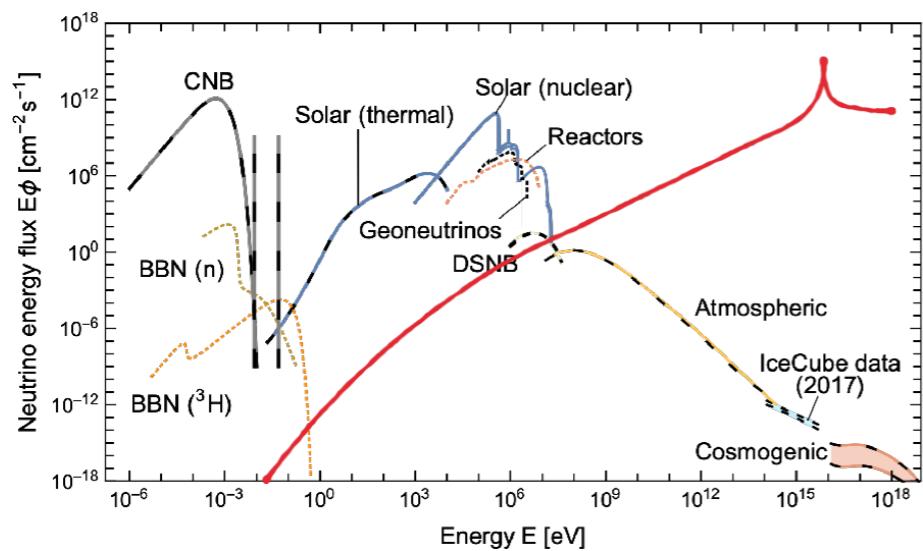

Search for Neutrino Sources

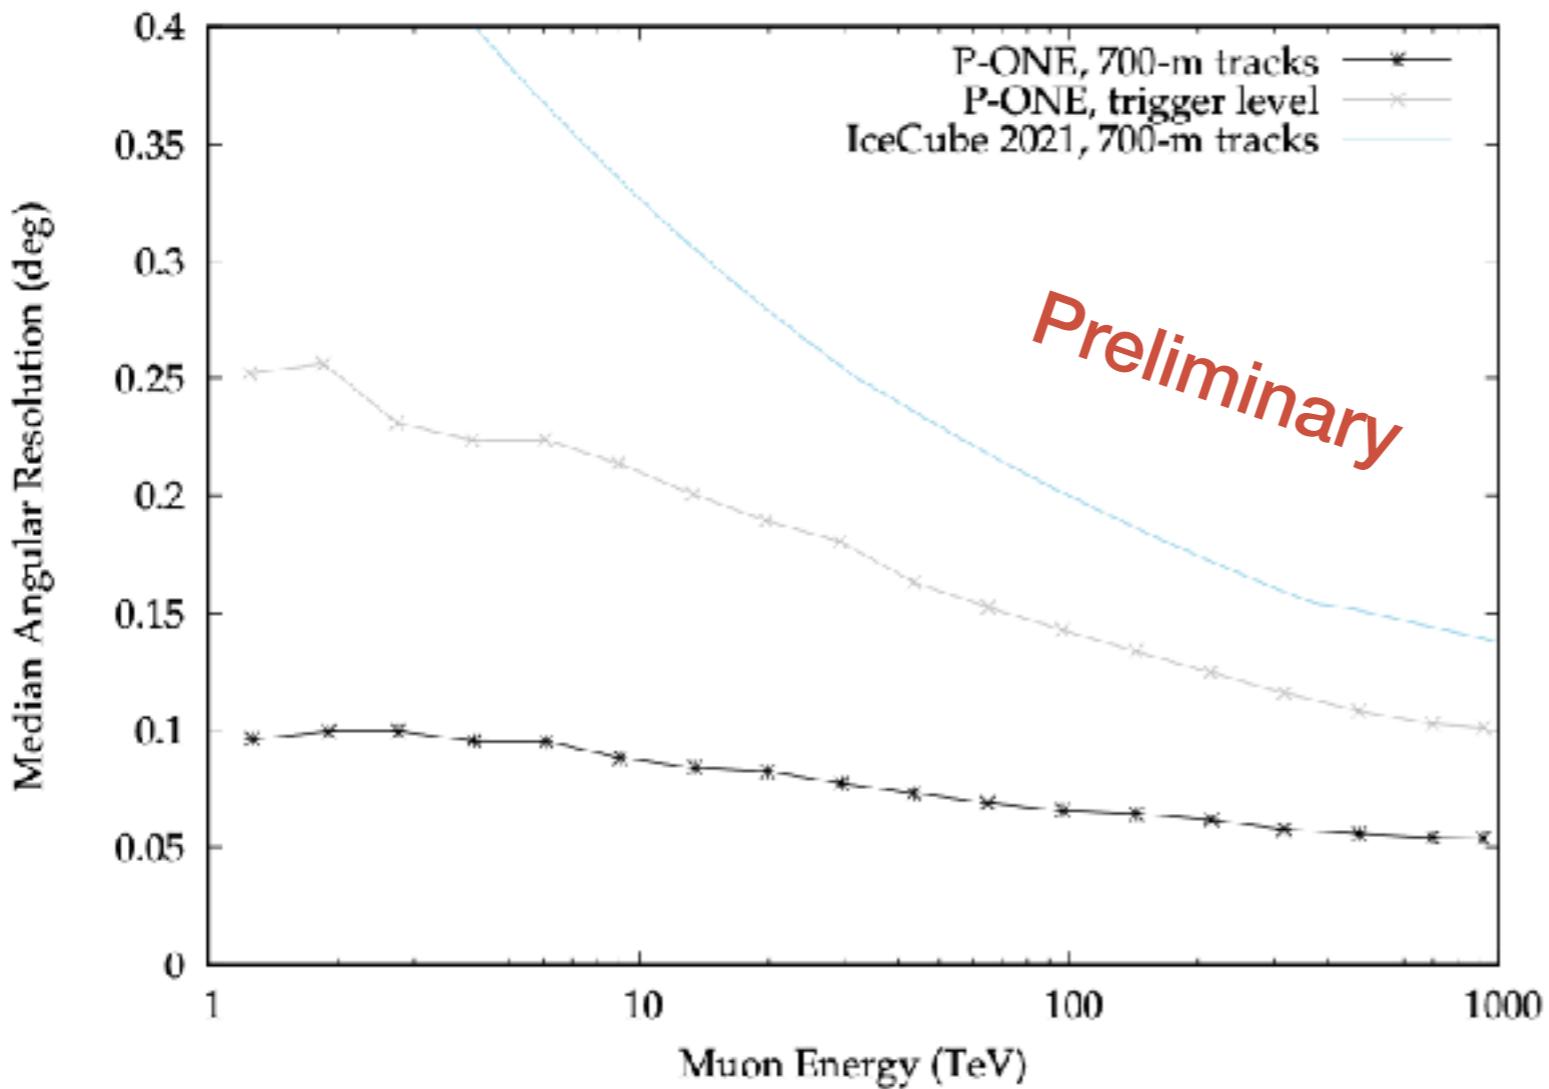

- The first neutrino sources have been identified using IceCube!

P-ONE Physics

- P-ONE will be optimized for particle identification, making it ideal for high energy neutrino flavour physics. Our system development focuses on the identification of track vs cascade vs double bang signatures, benefiting from the superior scattering properties of ocean water
- With a large P-ONE detector it will be possible to study BSM effects and the Glashow resonance
- Even a ~small detector will be able to join the larger detectors to contribute to point source searches, especially in the sky region not covered by the other detectors in the northern hemisphere and even improve overall sensitivity as the pointing accuracy is so much better in water

The P-ONE Advantage

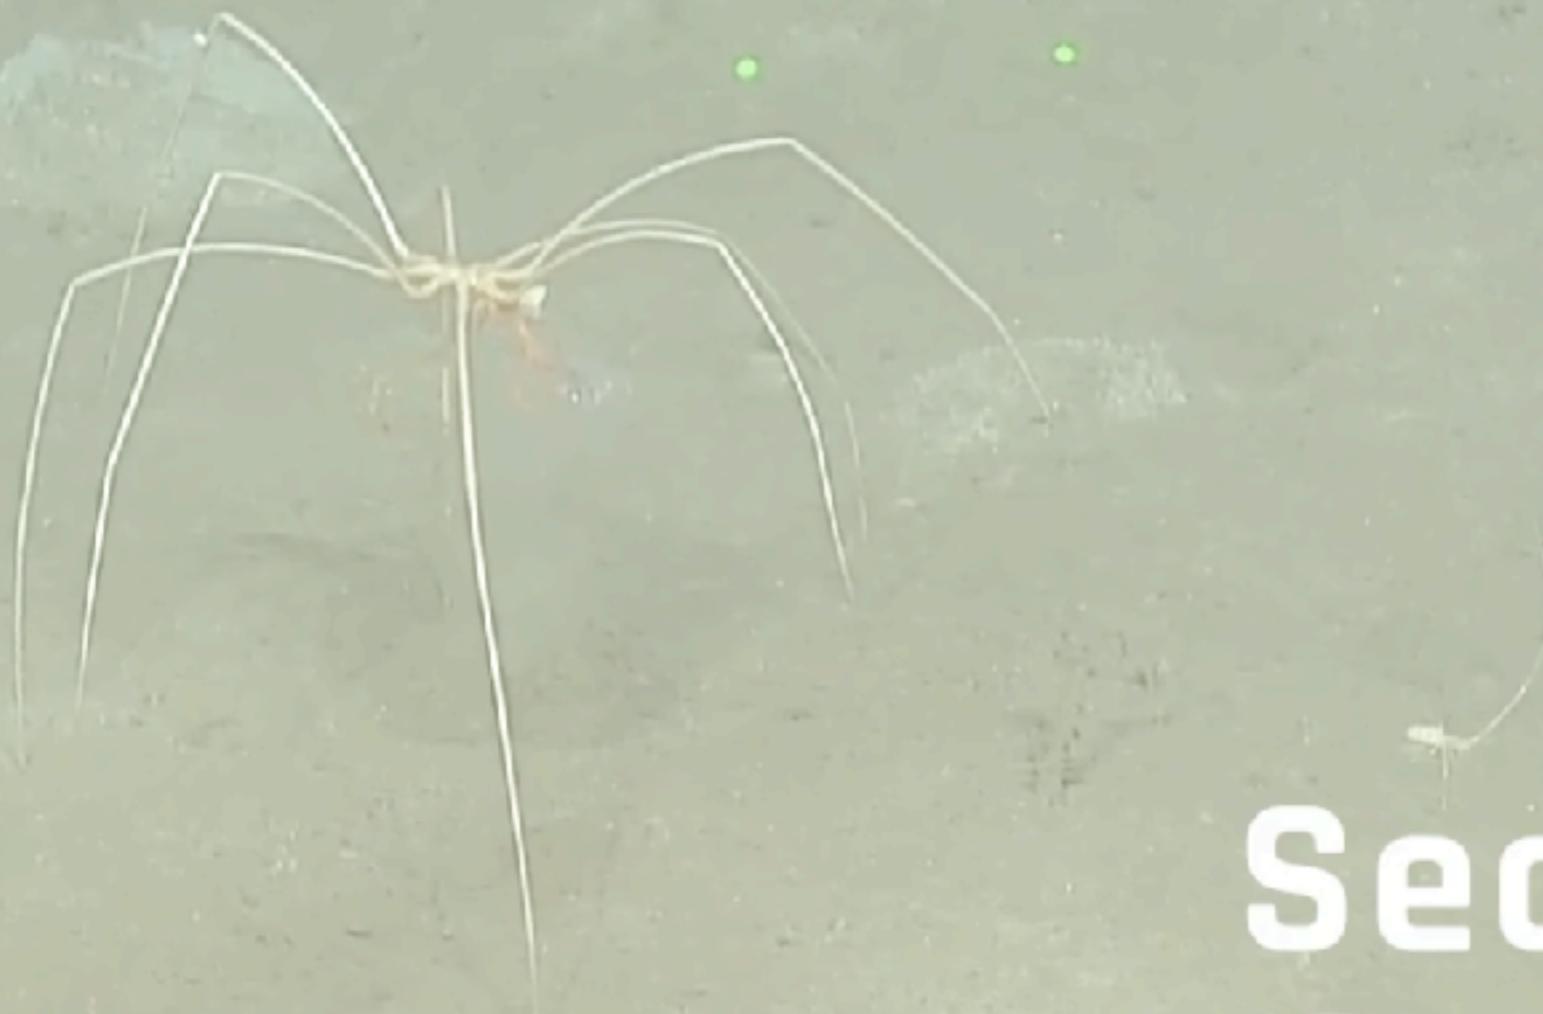

- Both angular resolution, particle identification and sensitivity of P-ONE are designed to be leading in class
- The choices of calibration tools, trigger systems, timing resolution and readout technology are chosen to optimize PID and pointing accuracy

P-ONE

- Alberta, Queen's, SFU, TRIUMF, TUM, Erlangen (Germany) and Drexel, Maryland, MSU (USA), Krakow (Poland), UCL (UK) Collaboration
- Started in 2018 with the deployment of a test setup to assess the water quality
- Significant funding in Germany for the first strings was secured in 2022
- The first US, Canadian and Polish funding was also secured in 2022, allowing for a robust effort to start prototype development and testing

Cascadia Basin Site

Pacific Ocean Neutrino Experiment (P-ONE) Demonstrator

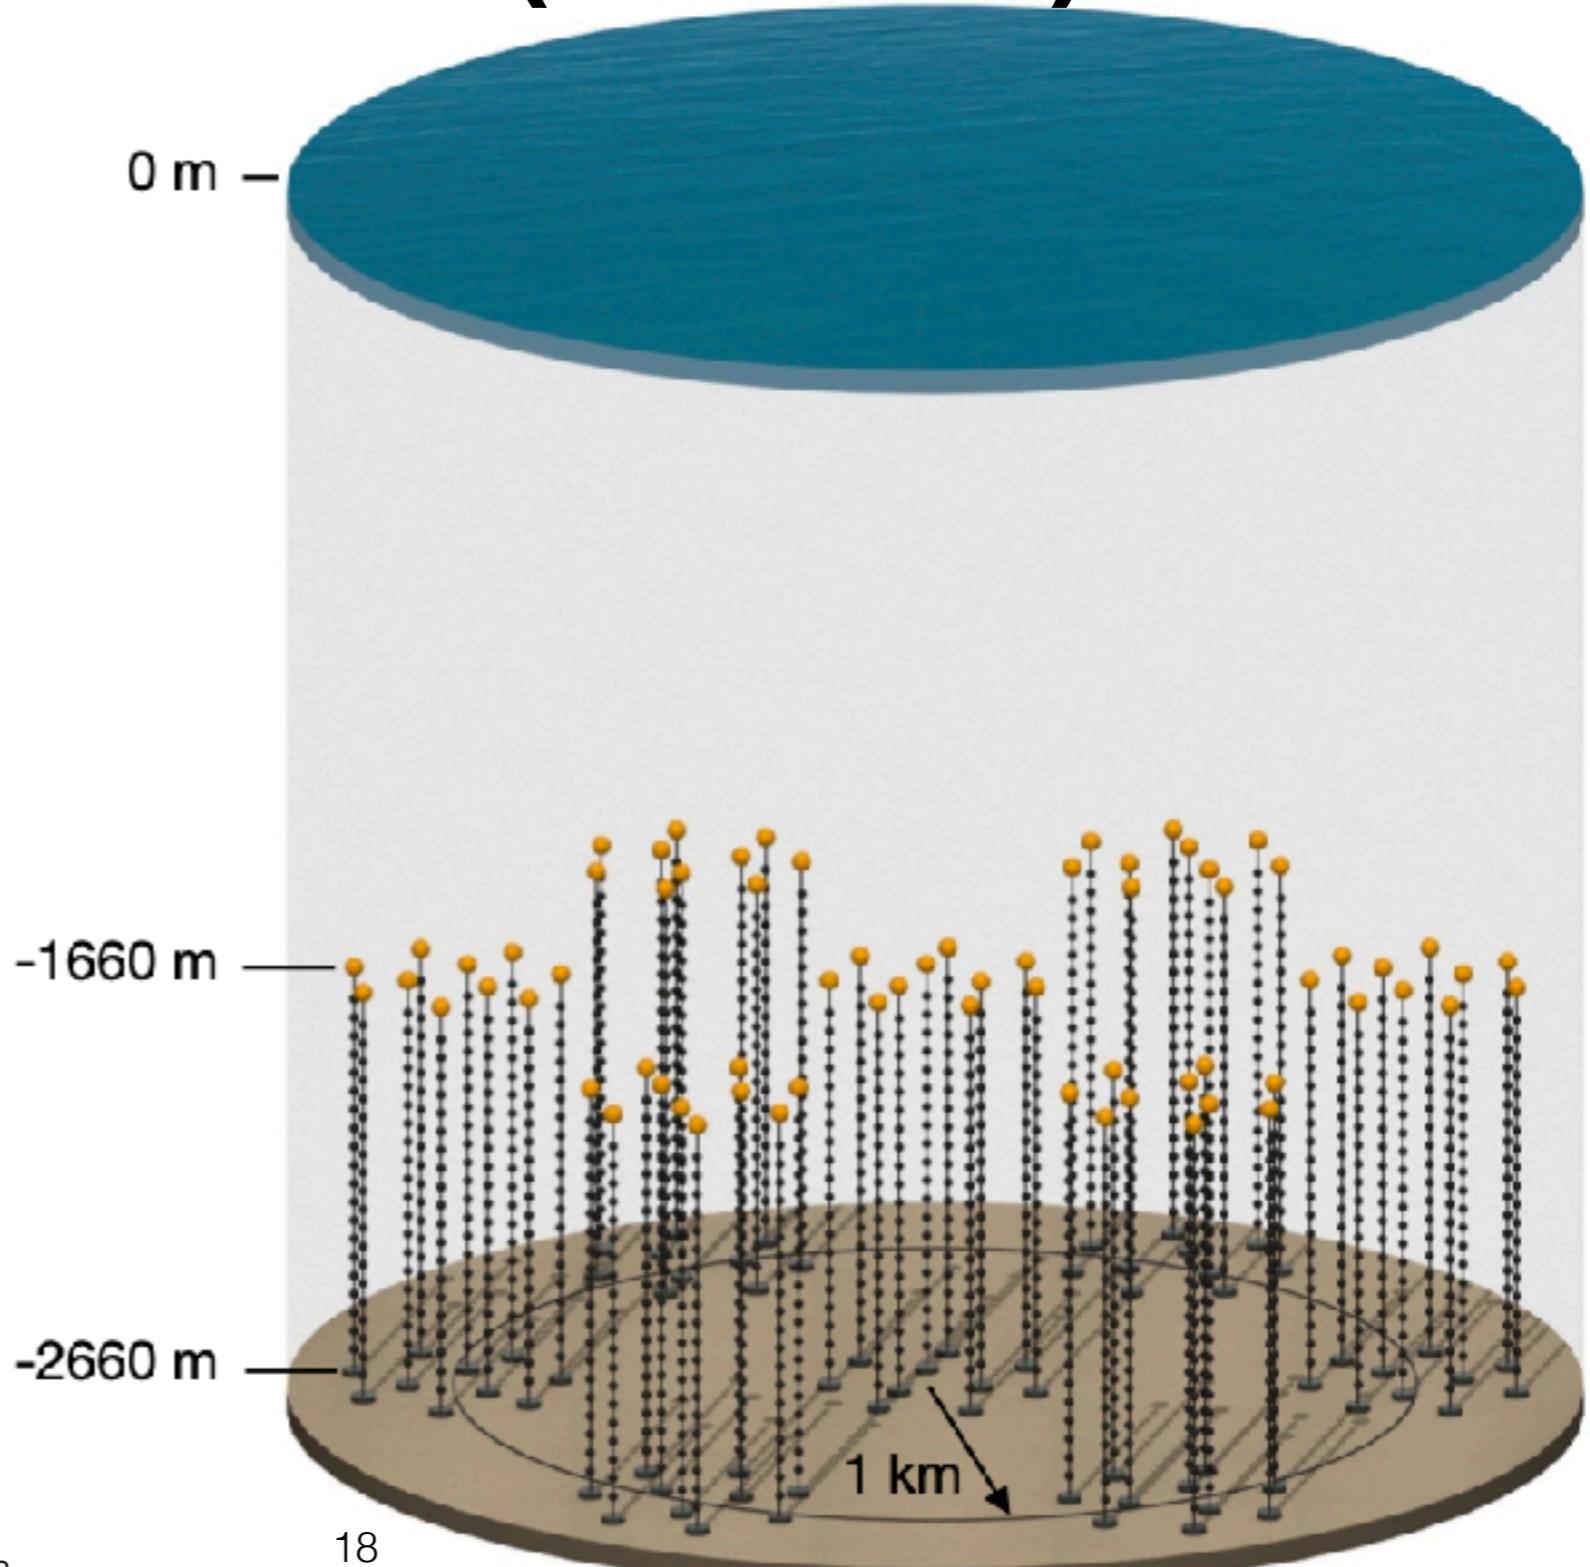

- Time scale for realization: 2024, first mooring line, more in the following years
- 1 km long mooring line
- Up to 10 strings with 20 optical and calibration modules each
- Instrumented volume $>1/8 \text{ km}^3$

Pacific Ocean Neutrino Experiment (P-ONE)

- The P-ONE collaboration aims to construct a km^3 scale detector by constructing seven identical modules of the *Demonstrator* type
- The optimal final arrangement is currently under study

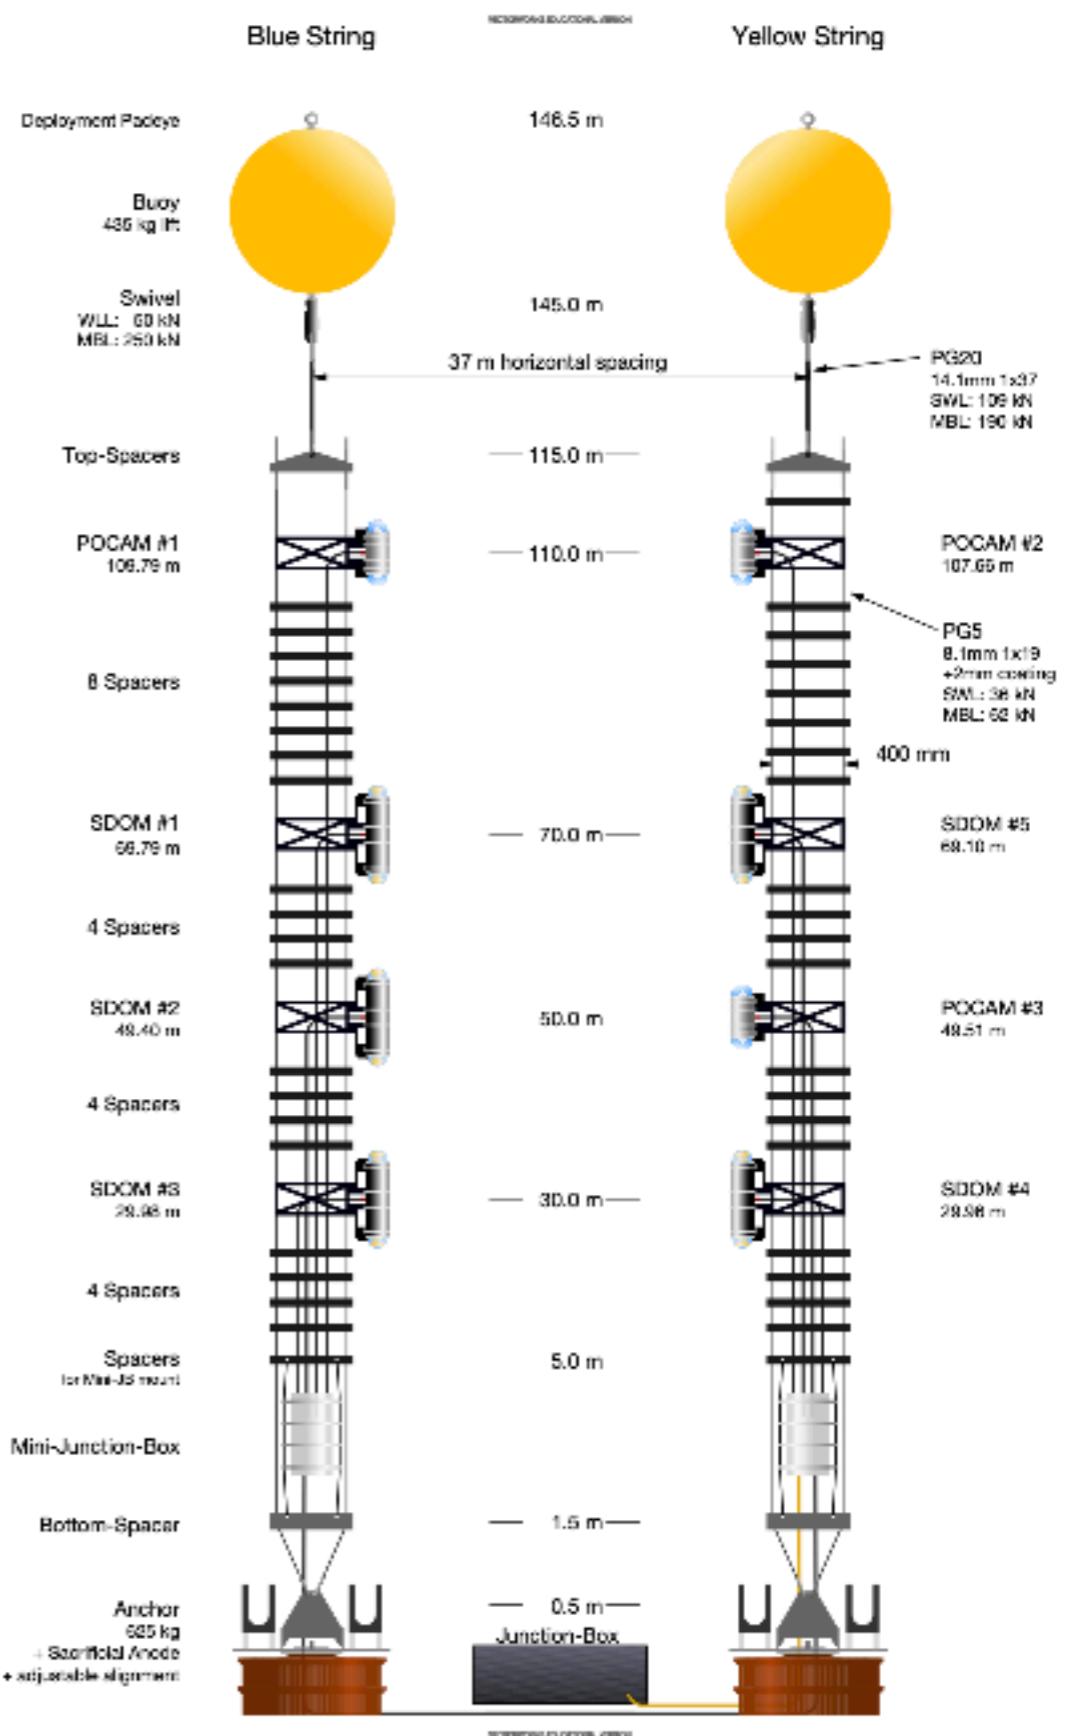

Large Area Photon Detection

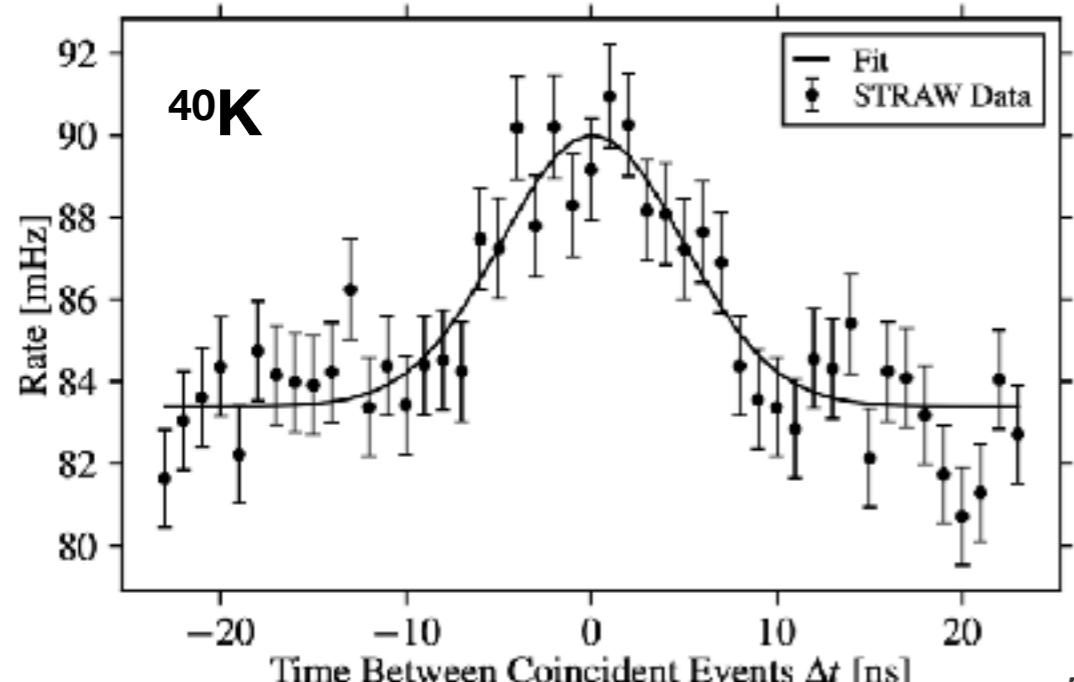

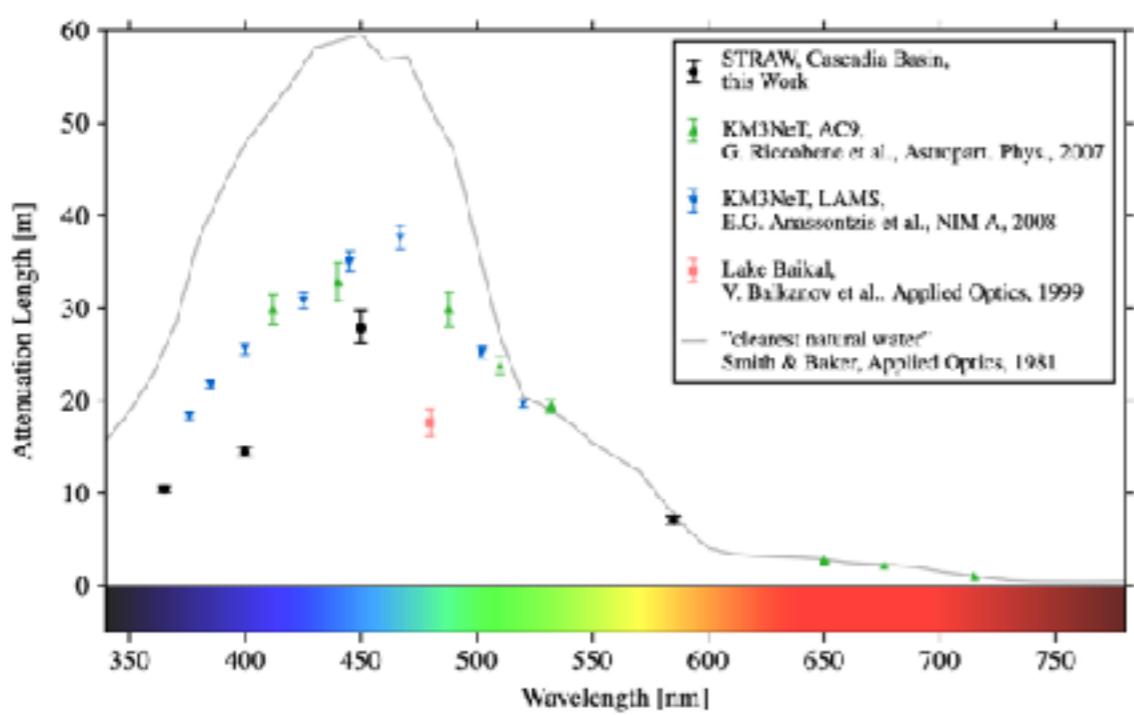

- The instrumentation of the ~200 optical modules of P-ONE will use KM3NeT/IceCube-like multi PMT digital optical modules
- 3" PMTs offer a good cost to surface area ratio
- Using a novel, side mounted housing allows obstruction-free observation

STRAW

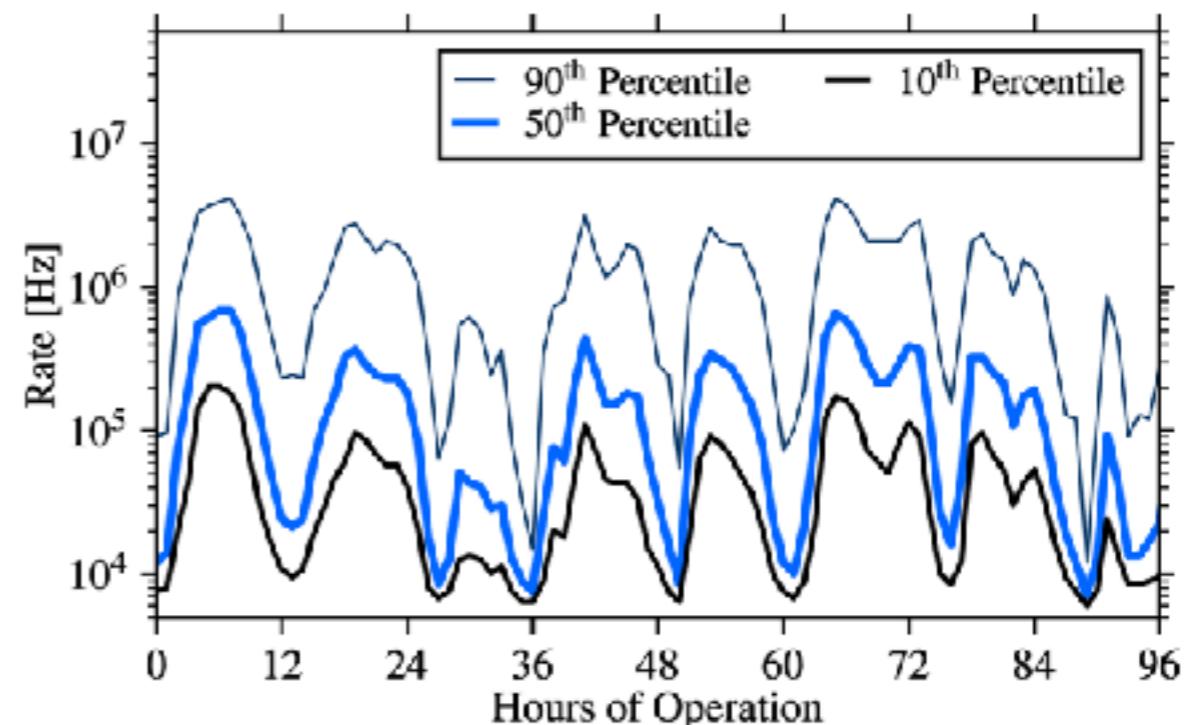

- Strings for Absorption in Water
- Deployed in summer 2018, removed in July 2023
- Instruments were working to the end
- Absorption and scattering length determined to be similar to other ocean based detector locations

Results: Attenuation Length & Bioluminescence

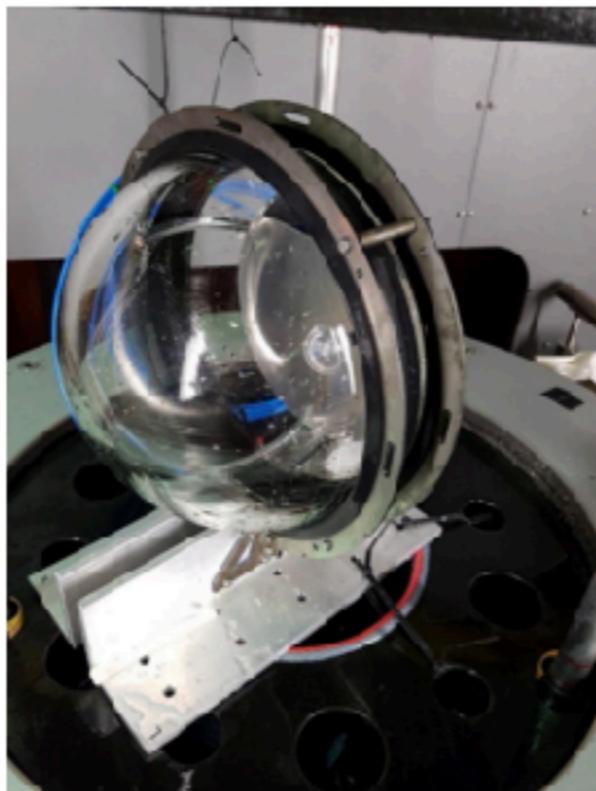

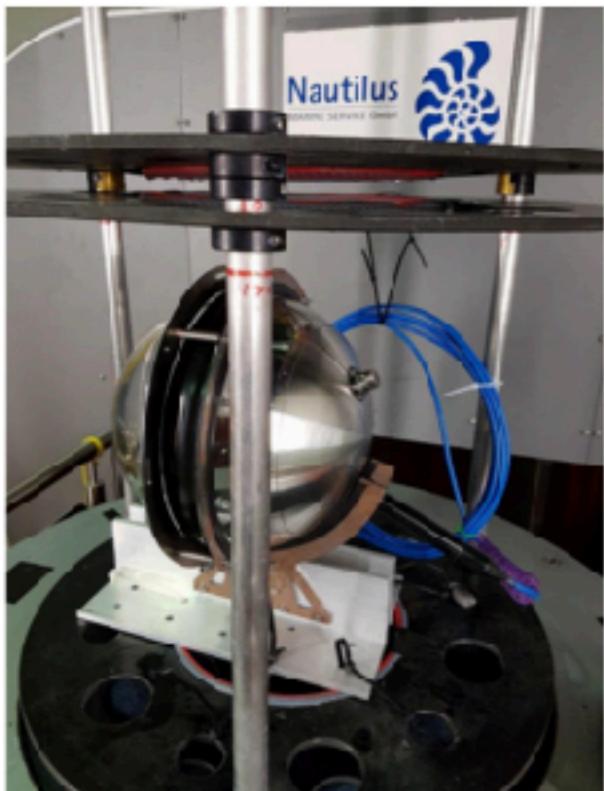

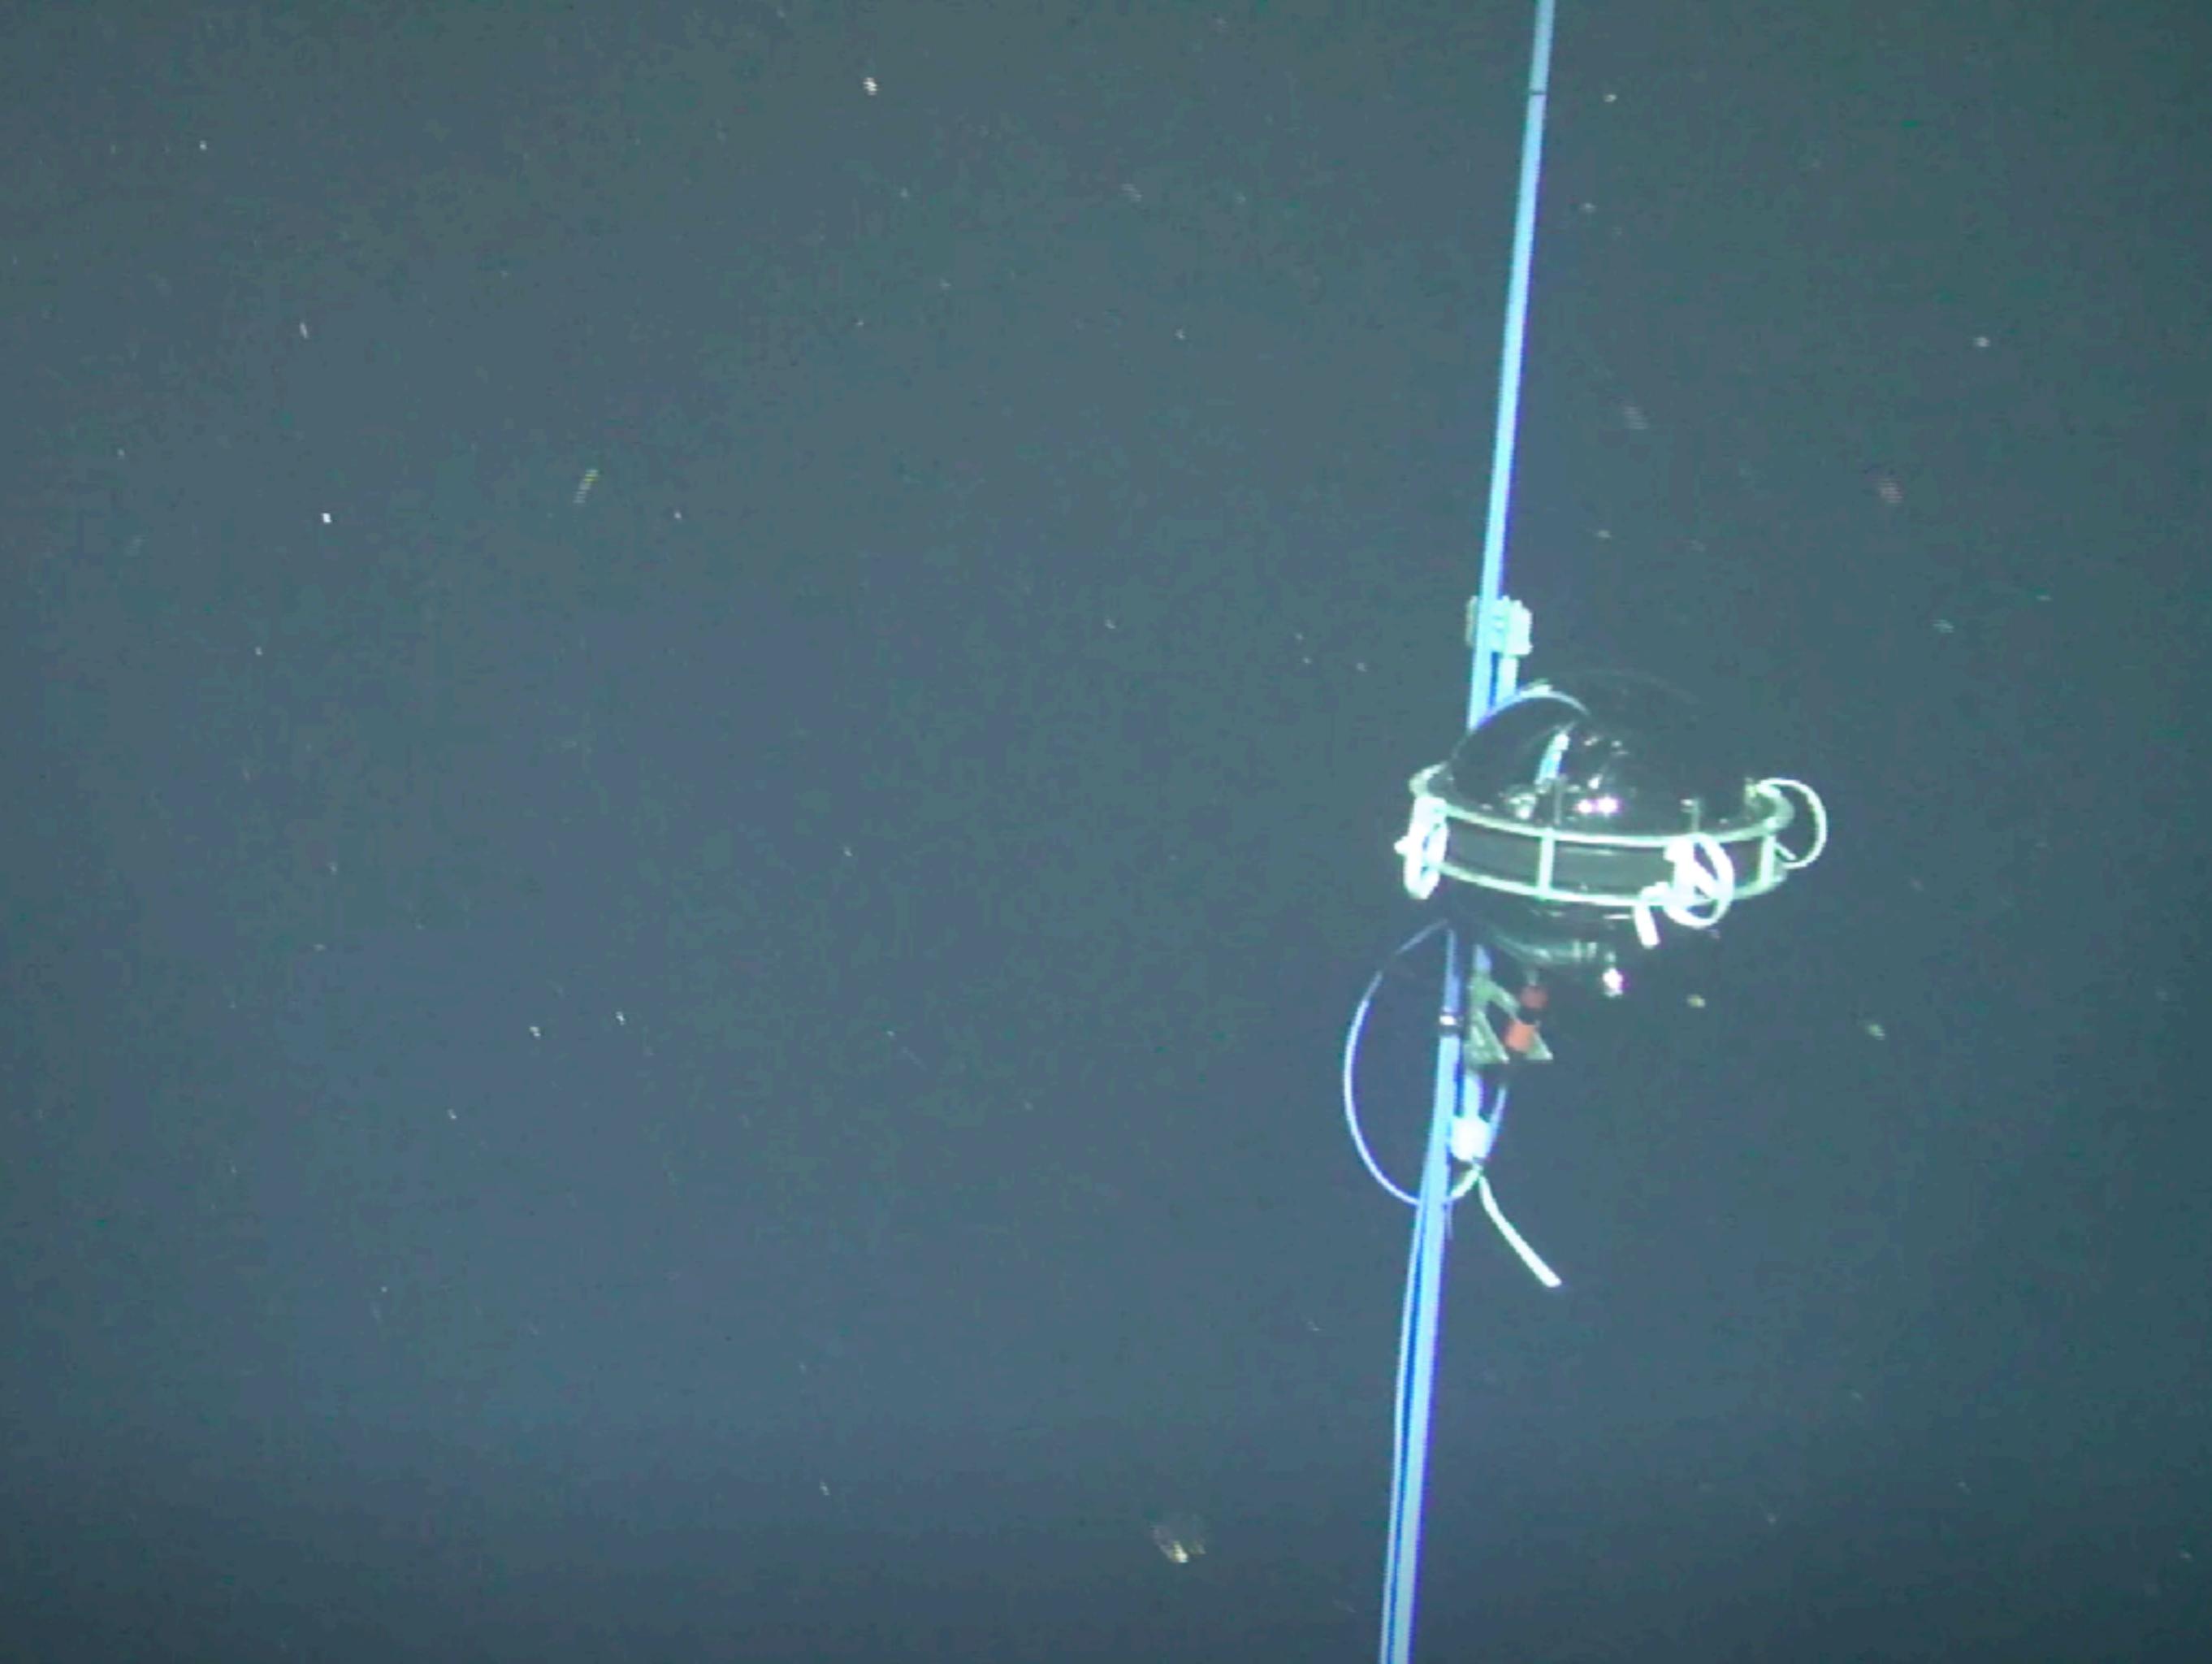

- Full publication with optical parameters:
- Bioluminescence is modulated with the tides
- ^{40}K Rate is consistent with ONC salinity measurements and expectations
- Attenuation length is good enough for a large scale neutrino telescope

STRAW-b

- Longer string with new, systematically independent measurements: LIDAR, spectrometer
- Modules were developed at TUM, Munich and shipped to Canada for deployment
- Complete qualification of the deep site.
- Test longer mooring line (500m) deployment and specialized devices.

Status

- Both STRAW and STRAW-b were delivering high quality data and were retrieved in July 2023
- We have published first data from the prototype setups and are preparing more data for publication
- We are preparing for the deployment of the first “real” P-ONE line in 2024

Activities In Canada

- Testing of Straw-B modules before deployment
- Selection of PMT model for P-ONE by systematic testing
- Biofouling studies and remedies (See talk by B. Veenstra, Wednesday)
- Leadership in the STRAW data taking and analysis to extract optical properties and performance data
- Reconstruction algorithm development
- Development of a new algorithm for tau event identification
- Background simulation (^{40}K and others)
- Trigger algorithm development and implementation
- Hardware development, flasher system, acoustic calibration and positioning system, electronics, calibration systems
- Final assembly and testing at TRIUMF for P-ONE.1, the first string
- Development of an internal muon tracker for reconstruction accuracy calibration
- DAQ development

Activities In Canada

- Development of an internal muon tracker for reconstruction accuracy calibration

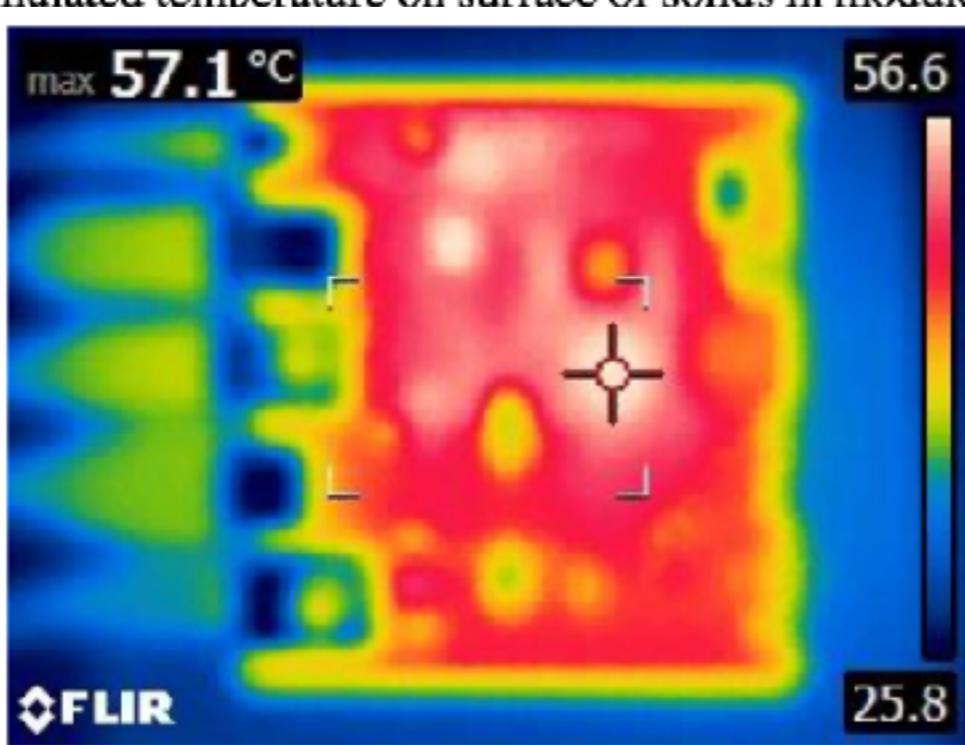

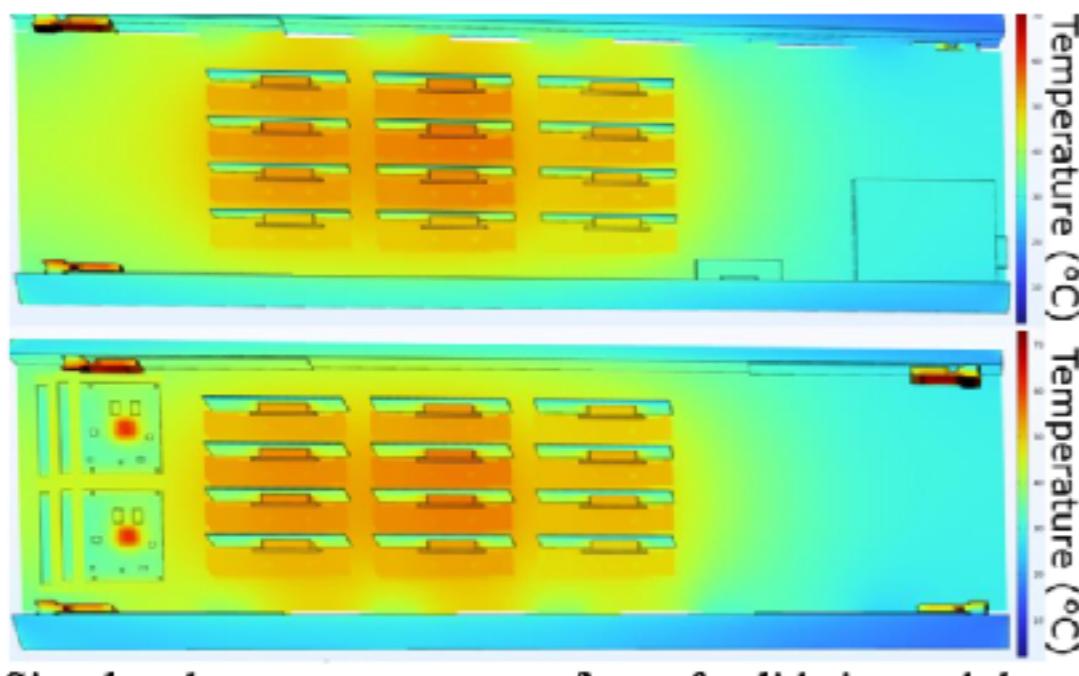

- DAQ development

Calibration Module

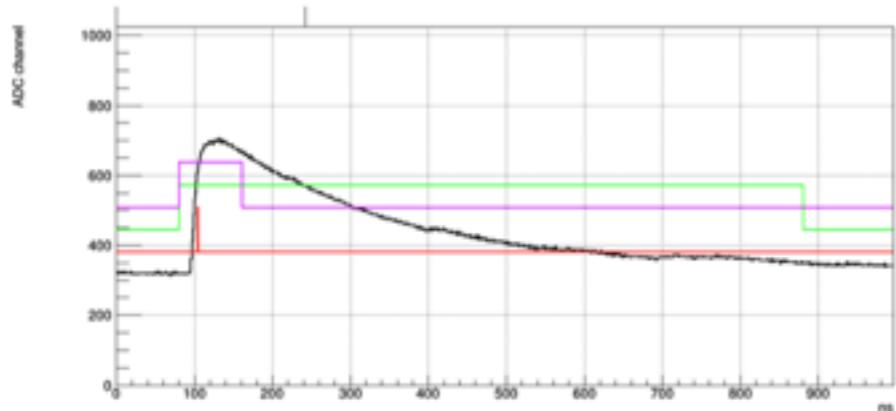

MiniJunction Box - trigger and mooring line power & data distribution

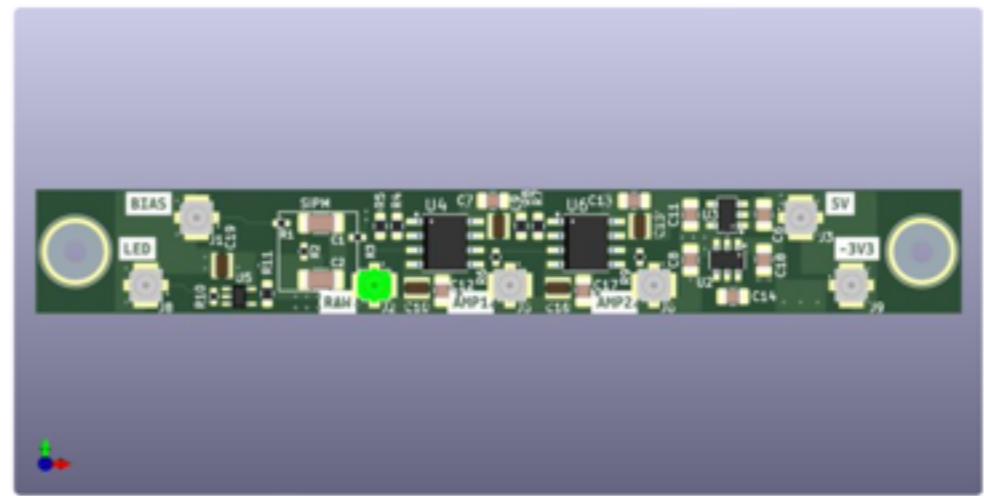

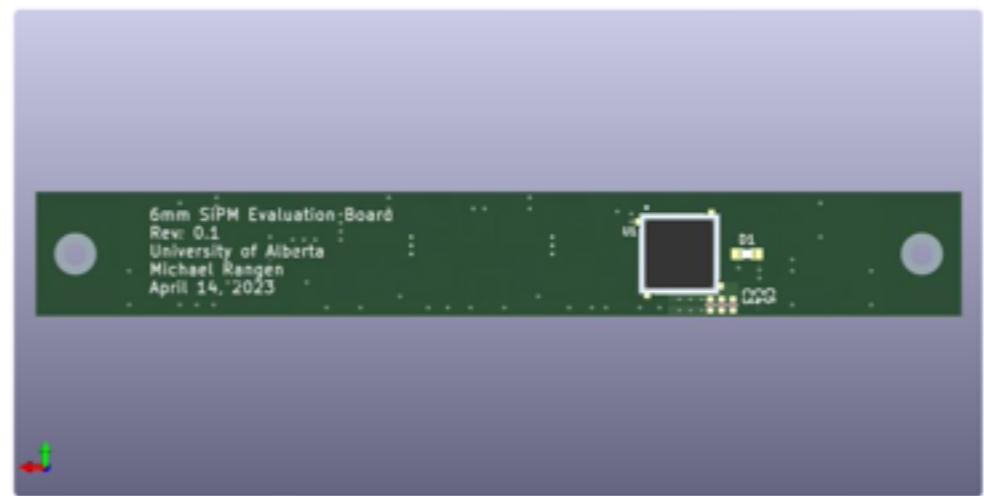

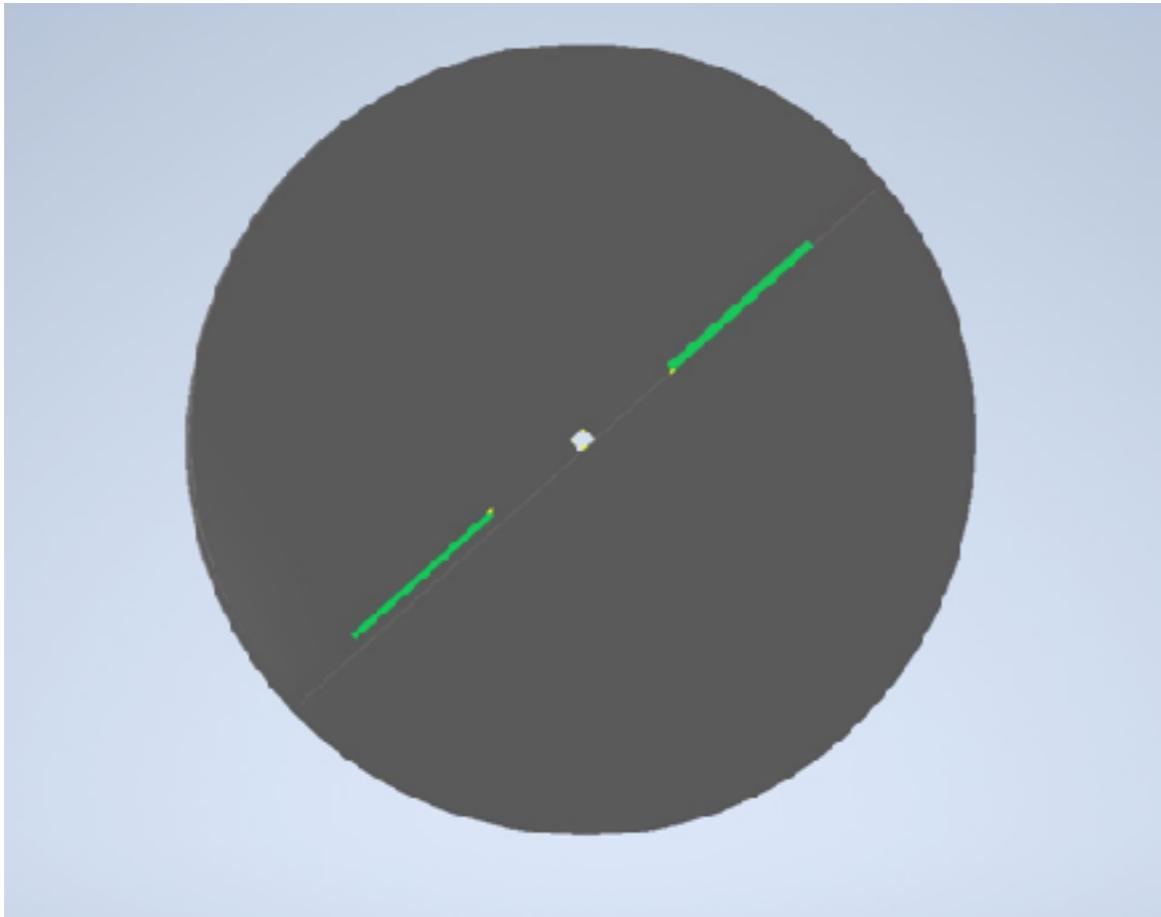

- The MiniJunction Box is the primary data and power system hub for each mooring line
- All systems are contained in a titanium pressure housing
- Thermal measurement and FEA simulations have shown that the current design is meeting requirements well

Silicon Muon Tracker System

Pacific Ocean Neutrino Explorer (P-ONE)

AN INITIATIVE OF University of Victoria

Description: This map illustrates the planned location of the Pacific Ocean Neutrino Explorer (P-ONE) at Cascadia Basin. P-ONE is a new initiative which aims to redevelop ocean-based neutrino telescopes by harnessing Ocean Networks Canada infrastructure.
Data Sources: University of Alberta, University of Bremen, USGS Cascadia, McMurdo Institute, Queen's University
Last Updated: 2 Jan 2021

OCEAN NETWORKS CANADA

Summary

P-ONE meeting Krakow, Poland May 2023

- Neutrino Astronomy will allow new and exciting studies for particle physics - The only thing keeping us from breakthrough discoveries is the small size of the current detectors
- The northern Pacific Ocean is ideally located and already instrumented by ONC for a new observatory to achieve full sky coverage
- Canadian groups have taken on major responsibilities for the initial string and are leading calibration systems, trigger systems and final assembly planning efforts towards the P-ONE demonstrator
