If DPDs factorize in terms of PDFs then

$$\sigma_{\text{eff}}^{-1} = \int d^2 \mathbf{z}_{\perp} \ \tilde{\mathbf{T}}(\mathbf{z}_{\perp})^2 = \int \frac{d^2 \mathbf{k}_{\perp}}{(2\pi)^2} \overline{\mathbf{T}}(\mathbf{k}_{\perp})^2$$

Effective Form Factor (EFF) =

FT of the probability distribution T

i.e. the probability of finding two partons

at transverse distance \mathbf{z}_1

If DPDs factorize in terms of PDFs then

$$\sigma_{\text{eff}}^{-1} = \int d^2 z_{\perp} \ \tilde{T}(z_{\perp})^2 = \int \frac{d^2 k_{\perp}}{(2\pi)^2} \overline{T(k_{\perp})^2}$$

Effective Form Factor (EFF) =
FT of the probability distribution T

$$T(k_{\perp}) \propto \int dx_1 dx_2 \ \tilde{F}(x_1, x_2, k_{\perp})$$

First moment of DPD

If DPDs factorize in terms of PDFs then

$$\sigma_{\text{eff}}^{-1} = \int d^2 \mathbf{z}_{\perp} \ \tilde{\mathbf{T}}(\mathbf{z}_{\perp})^2 = \int \frac{d^2 \mathbf{k}_{\perp}}{(2\pi)^2} \overline{\mathbf{T}(\mathbf{k}_{\perp})^2}$$

As for the standard FF:

$$\langle z_{\perp}^2 \rangle \propto \frac{d}{k_{\perp} dk_{\perp}} T(k_{\perp}) \Big|_{k_{\perp} = 0}$$

Effective Form Factor (EFF) = FT of the probability distribution T
$$T(k_{\perp}) \propto \int dx_1 dx_2 \ \tilde{F}(x_1, x_2, k_{\perp})$$

First moment of DPD

If DPDs factorize in terms of PDFs then

$$\sigma_{\text{eff}}^{-1} = \int d^2 z_{\perp} \tilde{T}(z_{\perp})^2 = \int \frac{d^2 k_{\perp}}{(2\pi)^2} T(k_{\perp})^2$$

As for the standard FF:

$$\langle z_{\perp}^2\rangle \propto \frac{d}{k_{\perp}dk_{\perp}} T(k_{\perp}) \left|_{k_{\perp}=0} \right|_{k_{\perp}=0}$$

From the asymptotic behavior we got the following relation:

$$\frac{\sigma_{\rm eff}}{3\pi} \le \langle {\sf z}_\perp^2 \rangle \le \frac{\sigma_{\rm eff}}{\pi}$$

M. R. and F. A. Ceccopieri, PRD 97, no. 7, 071501 (2018)

Effective Form Factor (EFF) = FT of the probability distribution T $T(k_{\perp}) \propto \int dx_1 dx_2 \ \tilde{F}(x_1, x_2, k_{\perp})$

First moment of DPD

If DPDs factorize in terms of PDFs then

$$\sigma_{\rm eff}^{-1} = \int d^2 z_{\perp} \ \tilde{T}(z_{\perp})^2 = \int \frac{d^2 k_{\perp}}{(2\pi)^2} T(k_{\perp})^2$$

As for the standard FF:

$$\langle z_{\perp}^2\rangle \propto \frac{d}{k_{\perp}dk_{\perp}} T(k_{\perp}) \left|_{k_{\perp}=0}\right|_{k_{\perp}=0}$$

From the asymptotic behavior we got the following relation:

$$\frac{\sigma_{\rm eff}}{3\pi} \leq \langle {
m z}_{\perp}^2 \rangle \leq \frac{\sigma_{\rm eff}}{\pi}$$
 Verified in all model calculations:

M. R. and F. A. Ceccopieri, PRD 97, no. 7, 071501 (2018)

$$DPD = GPD \otimes GPD$$

$$\frac{\sigma_{\rm eff}}{3\pi} \le \langle {\sf z}_\perp^2 \rangle \le \frac{\sigma_{\rm eff}}{\pi}$$

M. R. and F. A. Ceccopieri, PRD 97, no. 7, 071501 (2018)

If DPDs factorize in term

$$\frac{-1}{\text{eff}} = \int d^2 z_{\perp} \ \tilde{T}(z_{\perp})^2 = \int \frac{d^2 k_{\perp}}{(2\pi)^2} \overline{T(k_{\perp})^2}$$

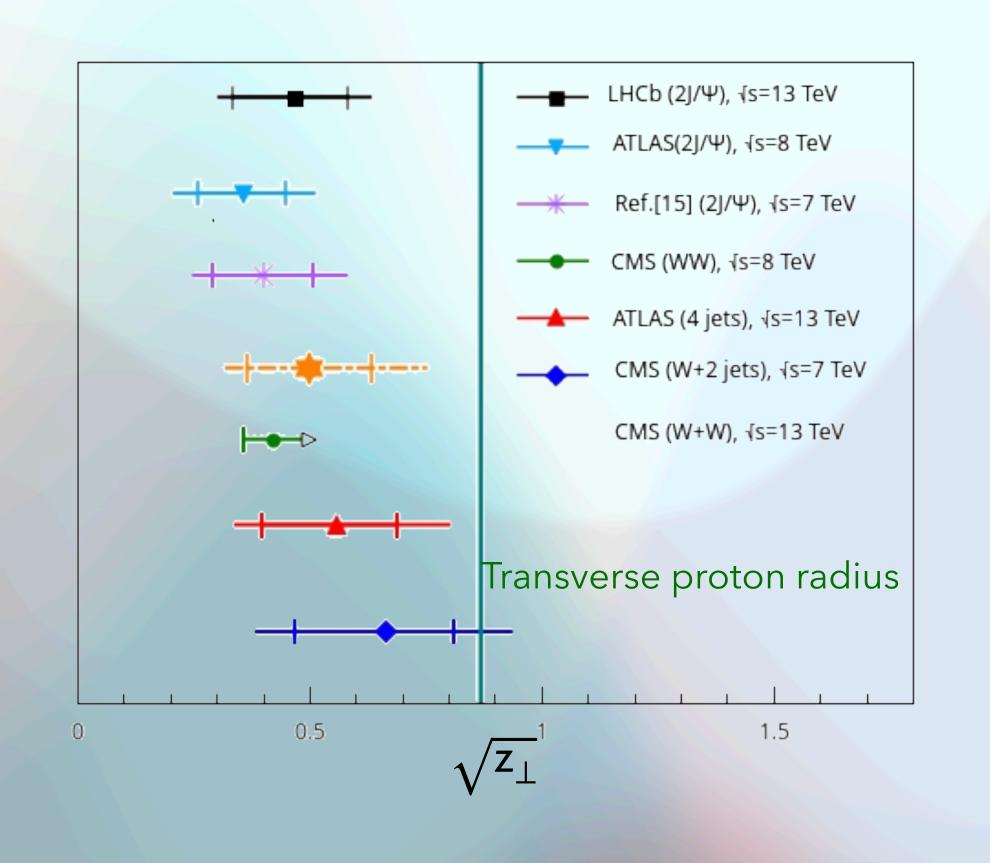

- THE MEAN DISTANCE IS LOWER THEN
- THE PROTON RADIUS! in hadron-hadron collisions we do not
- access directly the distance! M.R. and F. A. Ceccopieri, JHEP 09 (2019) 097

Froi

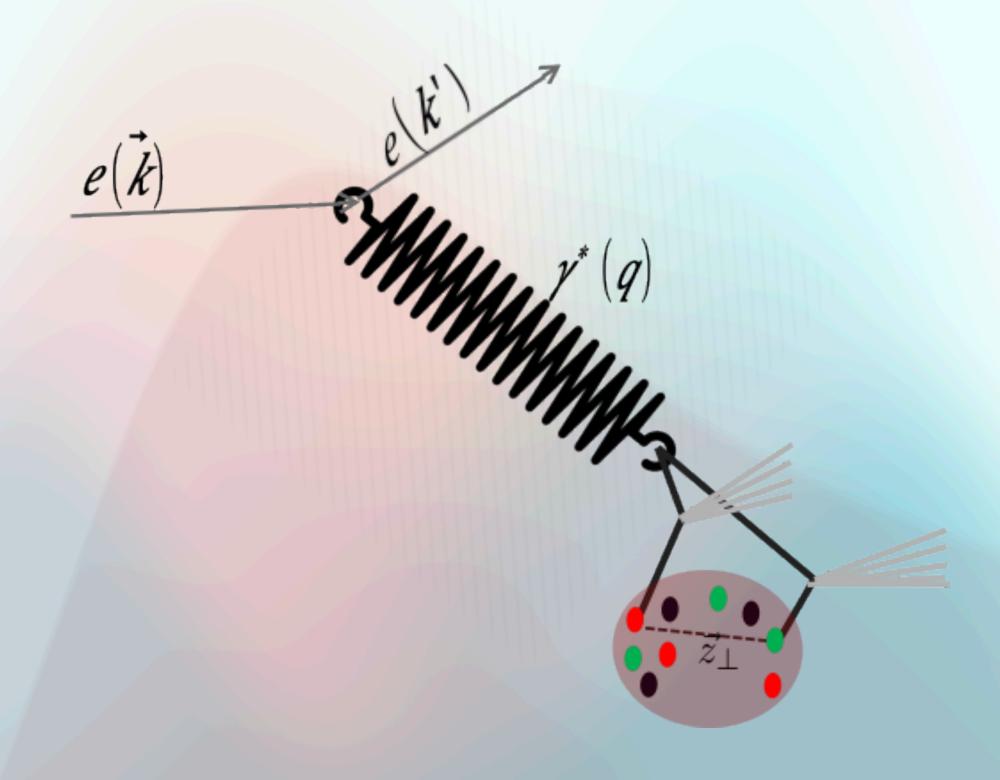

Lenavior we got the following relation:

$$\frac{\sigma_{\rm eff}}{3\pi} \le \langle {\rm z}_{\perp}^2 \rangle \le \frac{\sigma_{\rm eff}}{\pi}$$

M. R. and F. A. Ceccopieri, PRD 97, no. 7, 071501 (2018)

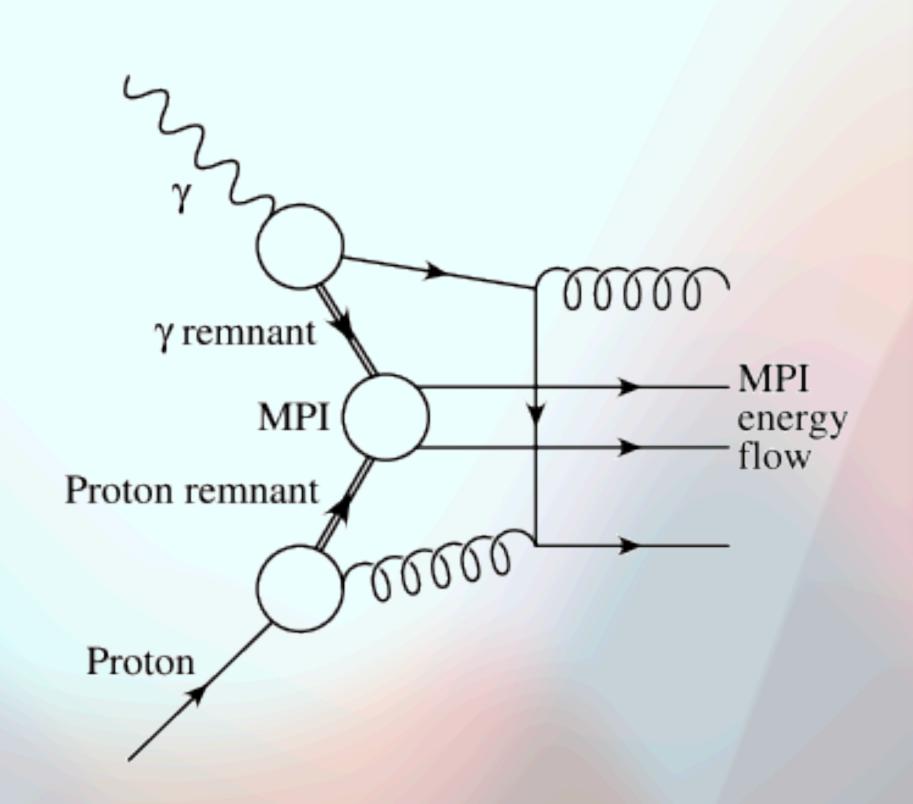

We consider the possibility offered by a DPS process involving a photon FLACTUATING in a quark-antiquark pair interacting with a proton:

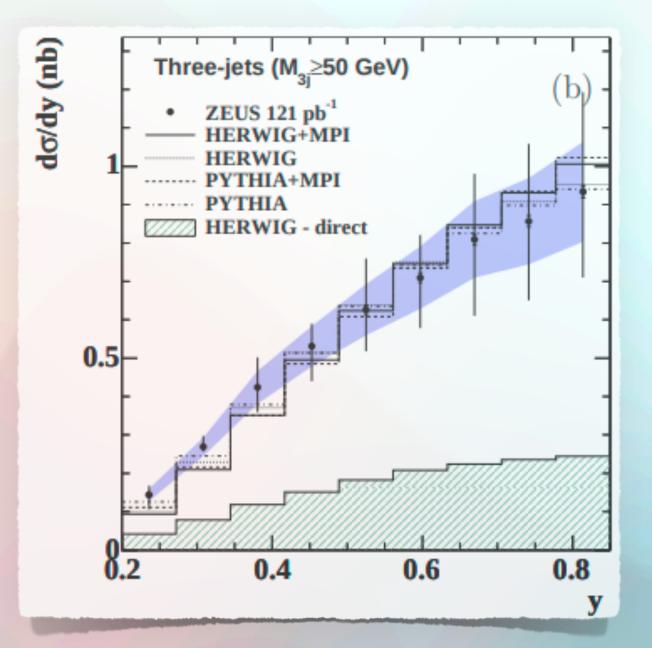

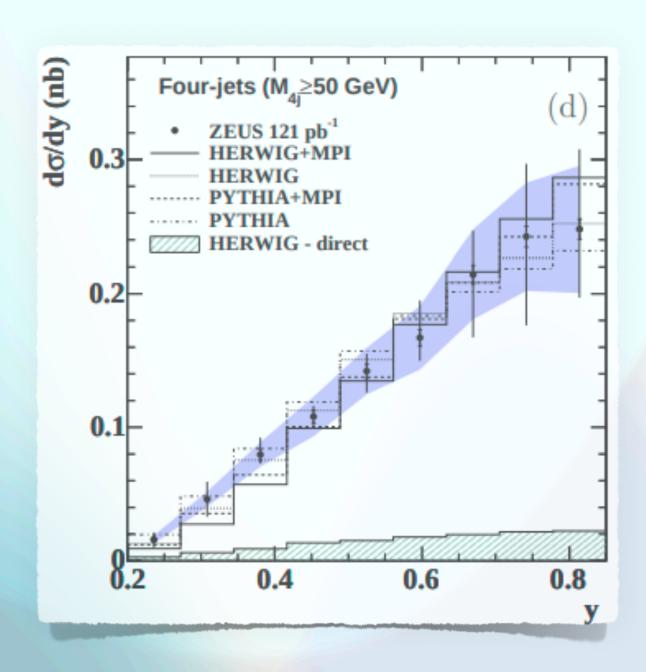

M. R. and F. A. Ceccopieri, PRD 105 (2022) L011501

Matteo Rinaldi

Already at HERA the importance of MPI for the 3,4 jets photo-production has been addressed:

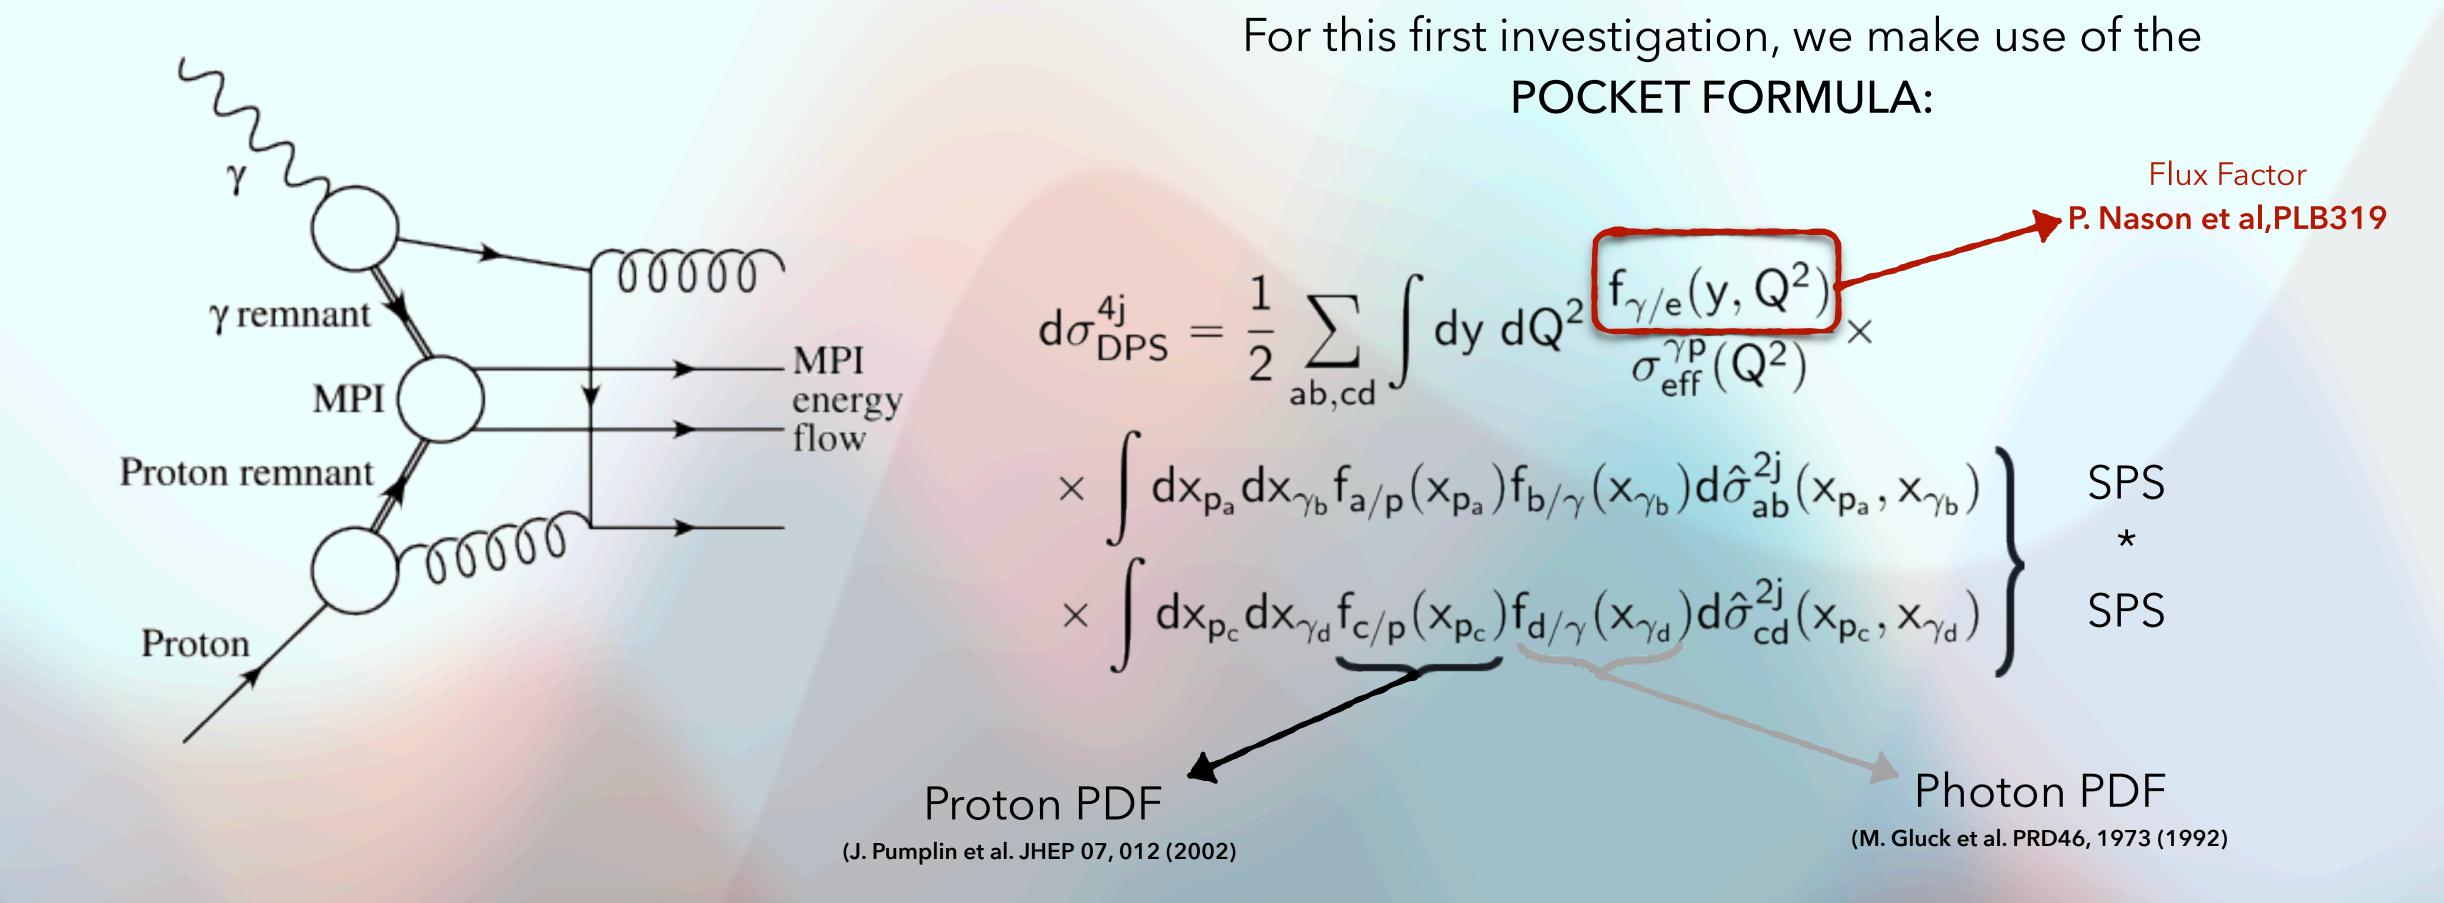

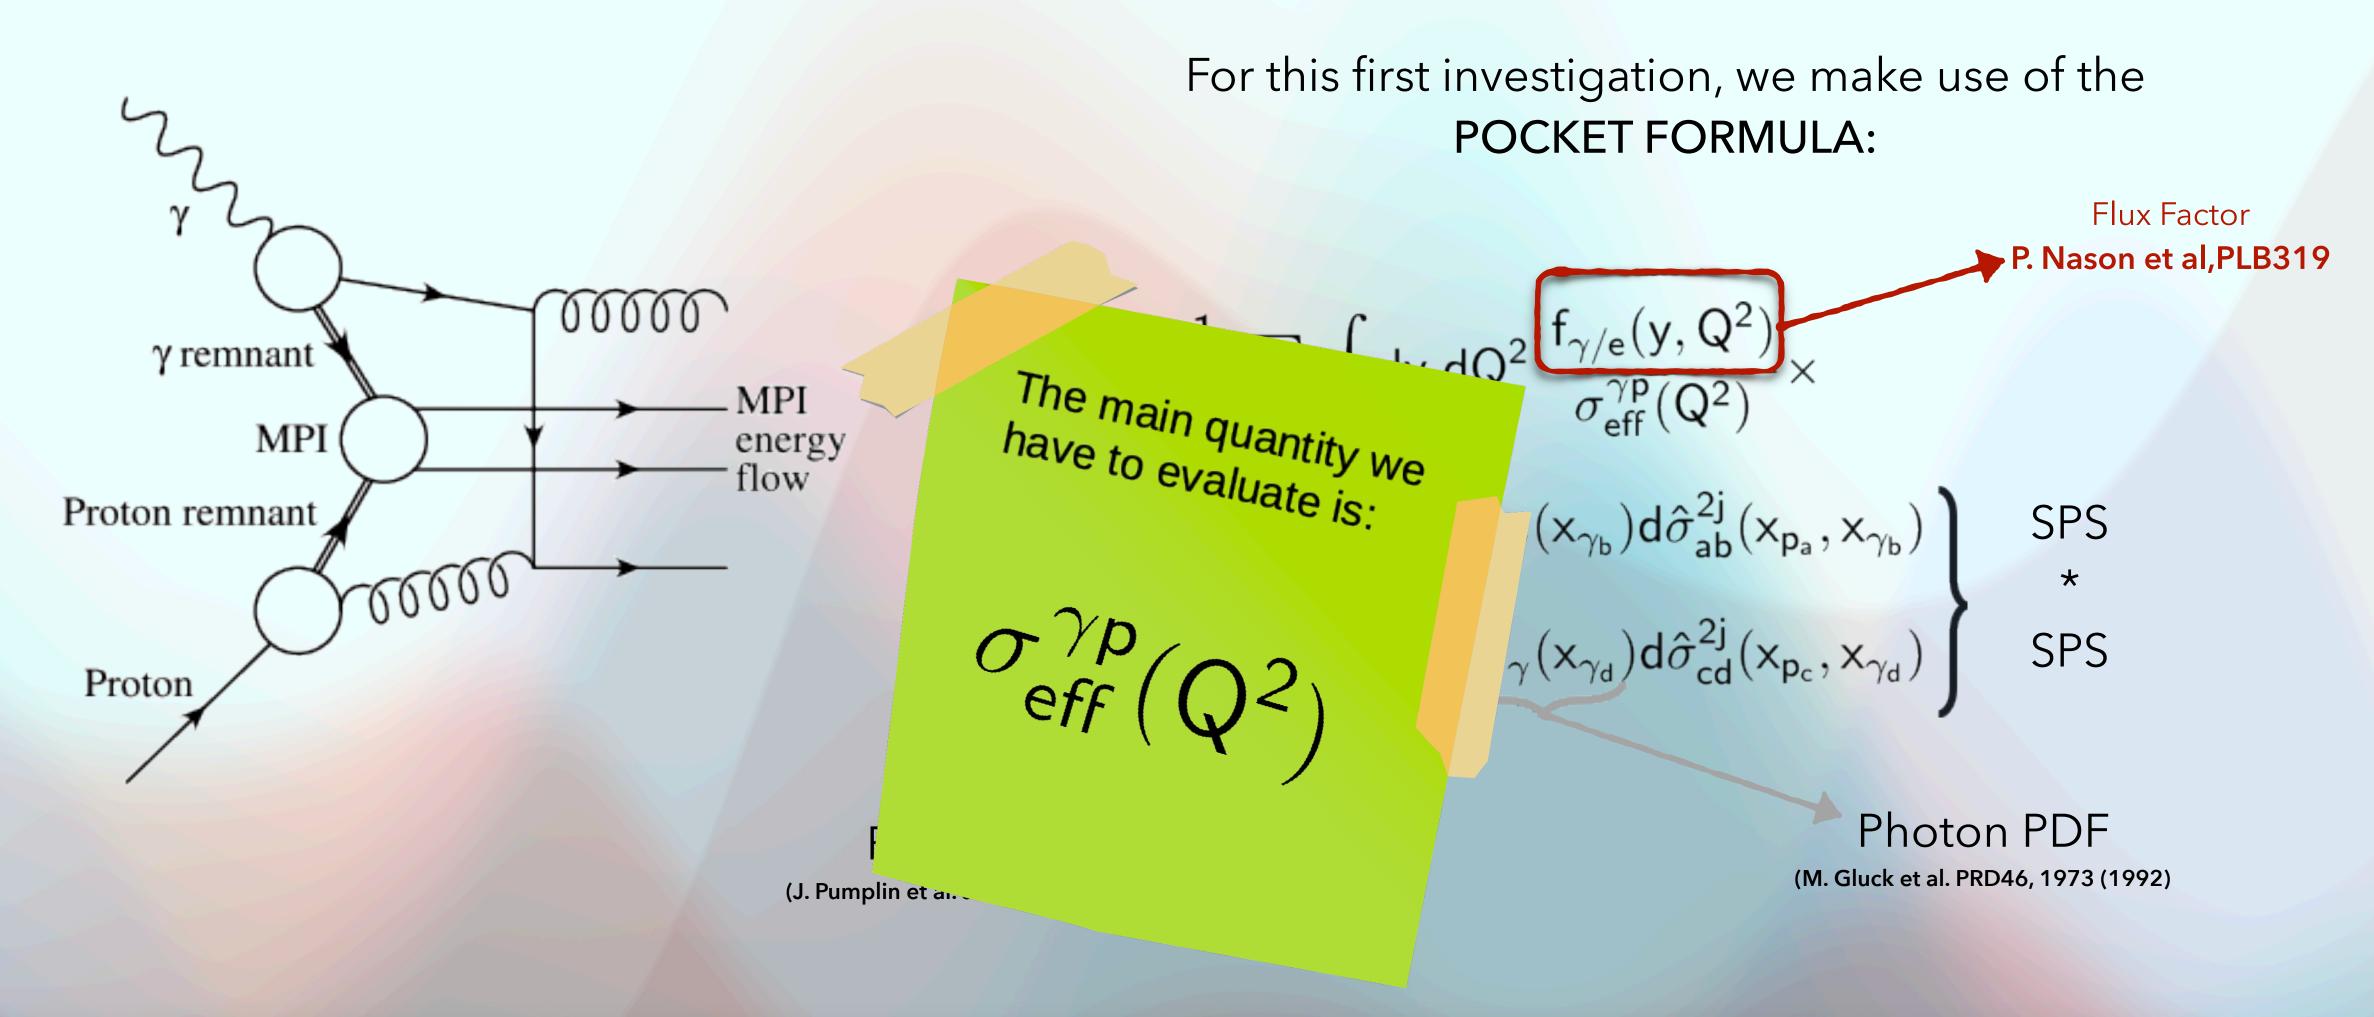

J. R. Forshaw et al, Z phys. C 72, 637

S. Chekanov et al [ZEUS coll.], Nucl. Phys B 792,1 (2008)

In order to study the impact of the DPS contribution to a process initiated via photon-proton interactions we evaluated the 4-JET photo-production at HERA (S. Checkanov et al. (ZEUS), Nucl. Phys B792, 1 (2008))

In order to study the impact of the DPS contribution to a process initiated via photon-proton interactions we evaluated the 4-JET photo-production at HERA (S. Checkanov et al. (ZEUS), Nucl. Phys B792, 1 (2008))

Matteo Rinaldi

MPI@LHC2023

The expression of this quantity is very similar to the proton-proton collision case and can be formally derived by comparing the product of SPS cross sections and the DPS one obtained in **Gaunt, JHEP 01, 042 (2013)** and describing a DPS from a vector bosons splitting with given Q² virtuality

$$\left[\sigma_{\rm eff}^{\gamma p}(\mathbf{Q}^2)\right]^{-1} = \int \frac{\mathsf{d}^2 \mathbf{k}_{\perp}}{(2\pi^2)} \frac{\mathsf{Proton}\,\mathsf{EFF}}{\mathsf{T}_p(\mathbf{k}_{\perp};\mathbf{Q}^2)}$$

The full DPS cross section depends on the amplitude of the splitting photon in a $q - \bar{q}$ pair. The latter can be formally described within a Light-Front (LF) approach in terms of LF wave functions

The 4-jets DPS cross-section

$$\begin{split} &d\sigma_{DPS}^{4j} = \frac{1}{2} \sum_{ab,cd} \int dy \ dQ^2 \ \frac{f_{\gamma/e}(y,Q^2)}{\boxed{\sigma_{eff}^{\gamma p}(Q^2)}} \times \\ &\times \int dx_{p_a} dx_{\gamma_b} f_{a/p}(x_{p_a}) f_{b/\gamma}(x_{\gamma_b}) d\hat{\sigma}_{ab}^{2j}(x_{p_a},x_{\gamma_b}) \\ &\times \int dx_{p_c} dx_{\gamma_d} f_{c/p}(x_{p_c}) f_{d/\gamma}(x_{\gamma_d}) d\hat{\sigma}_{cd}^{2j}(x_{p_c},x_{\gamma_d}) \end{split}$$

KINEMATICS:

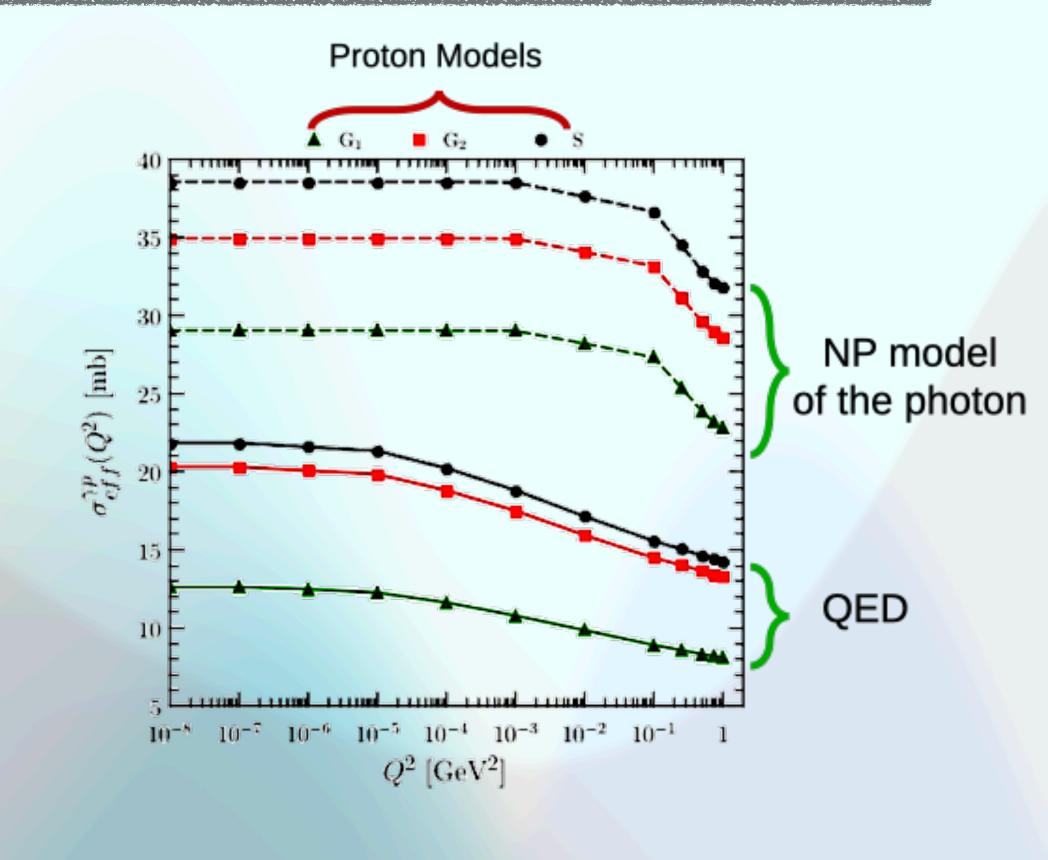

$$E_T^{jet} > 6 \text{ GeV}$$

$$|\eta_{
m jet}| < 2.4$$

$$Q^2 < 1 \text{ GeV}^2$$

 $0.2 \le y \le 0.85$

Proton Models

$d\sigma_{\mathsf{DPS}}^{\mathsf{4j}} = \frac{1}{2} \sum_{\mathsf{ab},\mathsf{cd}} \int_{\mathsf{ab},\mathsf{cd}}^{\mathsf{T}}$ $\times \int dx_{p_c} dx_{\gamma_d} f_{c/p}($

KINEMATICS:

$$E_T^{jet} > 6 \text{ GeV}$$

 $|\eta_{
m jet}| < 2.4$

$$Q^2 < 1 \,\mathrm{GeV}^2$$

$$0.2 \le y \le 0.85$$

The ZEUS collaboration guoted an integrated total 4-jet cross section of 136 pb						

S. Checkanov et al. (ZEUS), Nucl. Phys B792, 1 (2008)

The effective cross section can be also written in terms of probability distribution:

$$\left[\sigma_{\text{eff}}^{\gamma p}(Q^2)\right]^{-1} = \int d^2 z_{\perp} \ \tilde{F}_2^p(z_{\perp}) \tilde{F}_2^{\gamma}(z_{\perp}; Q^2)$$

The effective cross section can be also written in terms of probability distribution:

$$\left[\sigma_{\text{eff}}^{\gamma p}(Q^2)\right]^{-1} = \int d^2 z_{\perp} \ \tilde{F}_2^p(z_{\perp}) \tilde{F}_2^{\gamma}(z_{\perp}; Q^2)$$

We can expand the distribution related to the photon:

$$\tilde{\mathsf{F}}_2^{\gamma}(\mathsf{z}_{\perp};\mathsf{Q}^2) = \sum_{\mathsf{n}} \boxed{\mathsf{C}_{\mathsf{n}}(\mathsf{Q}^2)} \mathsf{z}_{\perp}^{\mathsf{n}}$$

Coefficients determined in a given approach describing the photon structure

The effective cross section can be also written in terms of probability distribution:

$$\left[\sigma_{\rm eff}^{\gamma p}(\mathbf{Q}^2)\right]^{-1} = \int d^2 \mathbf{z}_{\perp} \ \tilde{\mathbf{F}}_2^p(\mathbf{z}_{\perp}) \tilde{\mathbf{F}}_2^{\gamma}(\mathbf{z}_{\perp}; \mathbf{Q}^2)$$

We can expand the distribution related to the photon:

$$\tilde{\mathsf{F}}_2^{\gamma}(\mathsf{z}_\perp;\mathsf{Q}^2) = \sum_{\mathsf{n}} \boxed{\mathsf{C}_{\mathsf{n}}(\mathsf{Q}^2)} \mathsf{z}_\perp^{\mathsf{n}}$$

Coefficients determined in a given approach describing the photon structure

$$\left[\sigma_{\text{eff}}^{\gamma p}(Q^2)\right]^{-1} = \sum_{n} C_n(Q^2) \langle z_{\perp}^n \rangle_p$$

Mean value of the transverse distance between two partons in the PROTON

The effective cross section can be also written in terms of probability distribution:

$$\left[\sigma_{\text{eff}}^{\gamma p}(Q^2)\right]^{-1} = \int d^2 z_{\perp} \, \tilde{F}_2^p(z_{\perp}) \tilde{F}_2^{\gamma}(z_{\perp}; Q^2)$$

We can expand the distribution related to the photon:

$$\tilde{\mathsf{F}}_2^{\gamma}(\mathsf{z}_\perp;\mathsf{Q}^2) = \sum_{\mathsf{n}} \boxed{\mathsf{C}_{\mathsf{n}}(\mathsf{Q}^2)} \mathsf{z}_\perp^{\mathsf{n}}$$

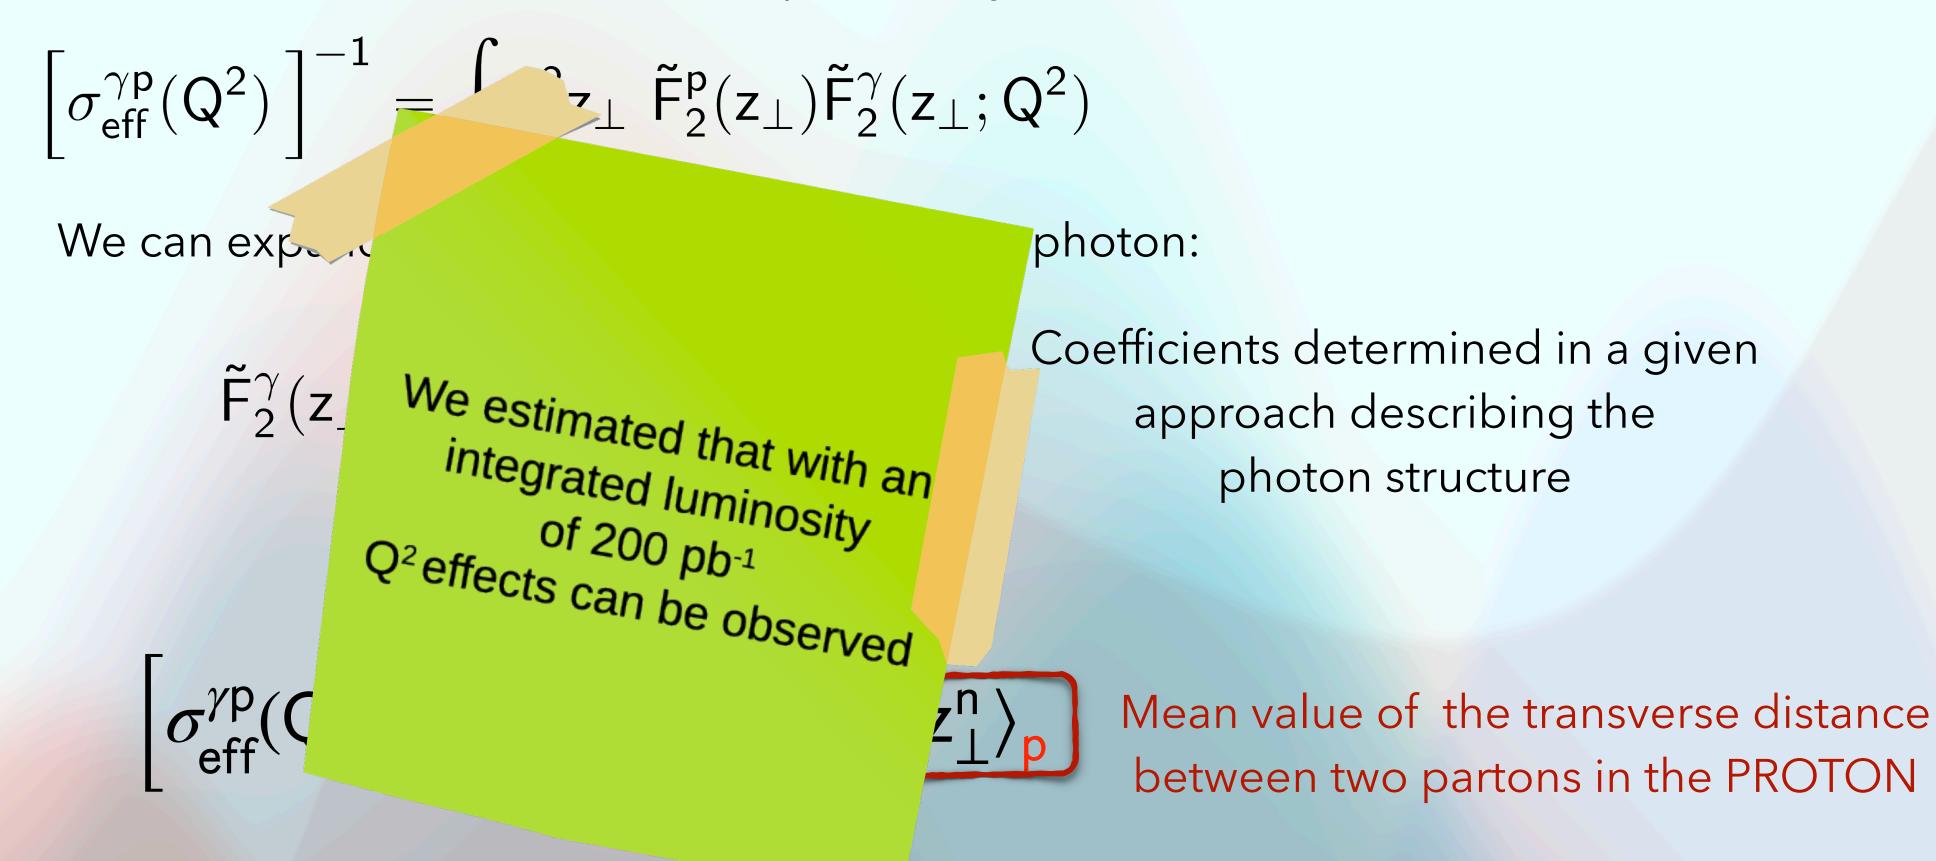

Coefficients determined in a given approach describing the photon structure

$$\left[\sigma_{\text{eff}}^{\gamma p}(Q^2)\right]^{-1} = \sum_{n} C_n(Q^2) \langle z_{\perp}^n \rangle_p$$

Mean value of the transverse distance between two partons in the PROTON

If we could measure $\sigma_{\rm eff}^{\gamma p}(Q^2)$ we could access NEW INFORMATION ON THE PROTON STRUCTURE

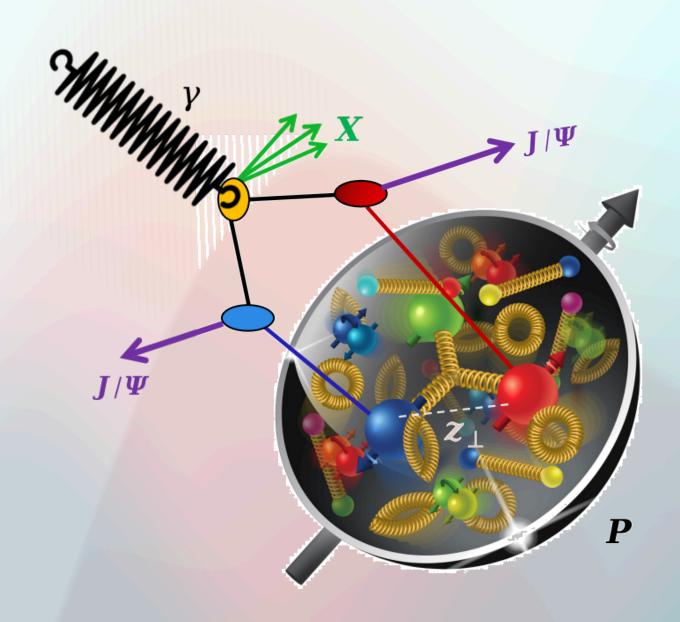

The effective cross section can be also written in terms of probability distribution:

If we could measure $\sigma_{\rm eff}^{\gamma p}(Q^2)$ we could access NEW INFORMATION ON THE PROTON STRUCTURE

Di J/\psi photo-production@EIC

Illustration of DPS for $\gamma + p \rightarrow J/\psi + J/\psi + X$

We consider the possibility of **resolved** photon to estimate the DPS cross section in quarkonium-pair photoproduction at the EIC

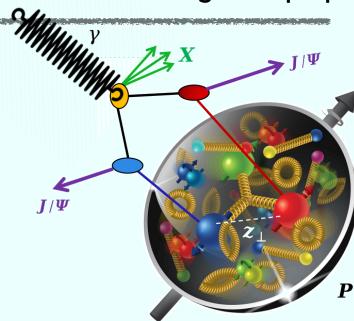

Di J/\psi photo-production@EIC

F. A. Ceccopieri, H. S. Shao, J. P. Lansberg, M. R. and R. Sangem in prep.

*Slide from R. Sangem

$$\sigma_{SPS}^{(J/\psi,J/\psi)} \propto \sum_{a=a} \int dx_{p_a} f_{a/p}(x_{p_a},\mu) d\hat{\sigma}^{\gamma a \to J/\psi + J/\psi + a}$$

unresolved/direct

$$\sigma_{SPS}^{(J/\psi,J/\psi)} \propto \sum_{a,b=g,q} \int dx_{\gamma_a} \, dx_{p_b} \underbrace{f_{a/\gamma}(x_{\gamma_a},\mu)}_{f_{b/p}(x_{p_b},\mu)} \underbrace{d\hat{\sigma}^{ab\to J/\psi+J/\psi}}_{a,b=g,q}$$

resolved

$$\sigma_{DPS}^{(J/\psi,J/\psi)} \propto \frac{1}{2} \frac{1}{\sigma_{eff}^{\gamma p}} \sum_{a,b,c,d} \int dx_{\gamma_a} dx_{p_b} f_{a/\gamma}(x_{\gamma_a},\mu) f_{b/p}(x_{p_b},\mu) d\hat{\sigma}_{SPS}^{ab \to J/\psi}(x_{\gamma_a},x_{p_b})$$

$$\times dx_{\gamma_c} dx_{p_d} f_{c/\gamma}(x_{\gamma_c},\mu) f_{d/p}(x_{p_d},\mu) d\hat{\sigma}_{SPS}^{cd \to J/\psi}(x_{\gamma_c},x_{p_d})$$

Proton PDF

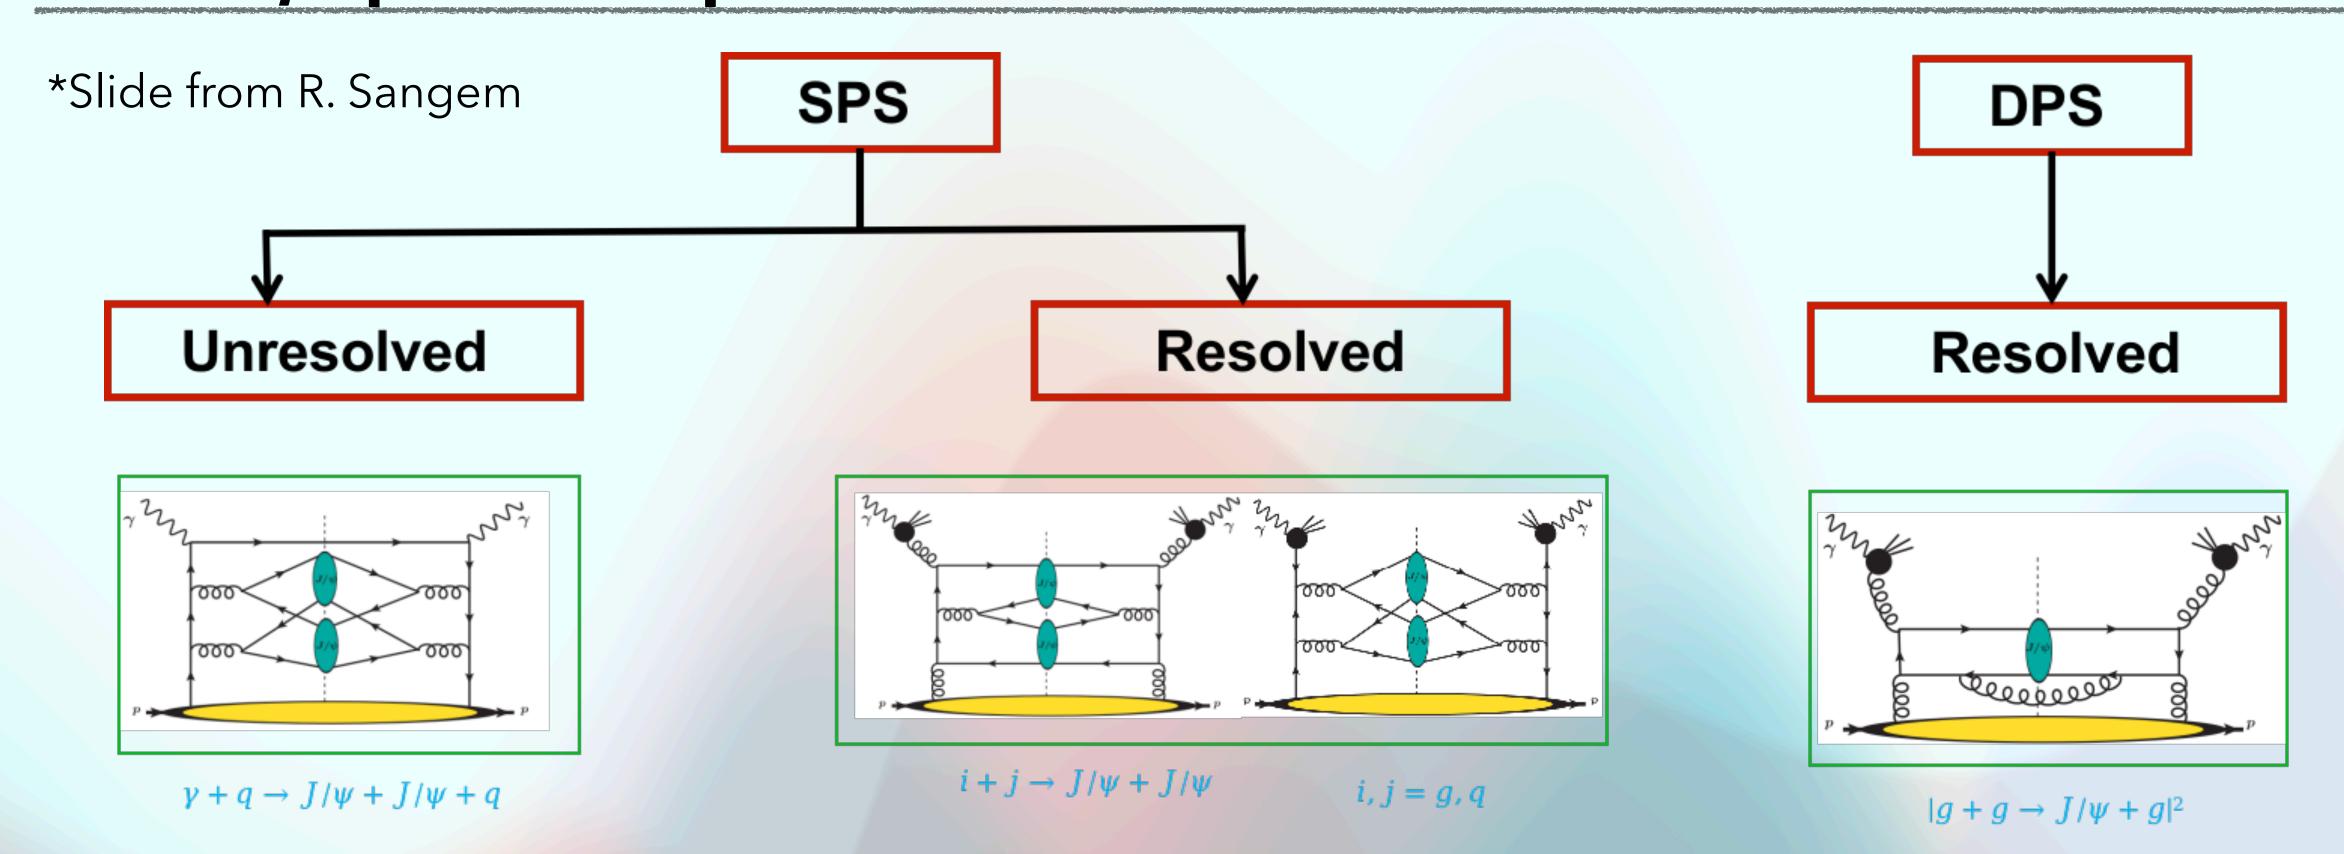

Photon PDF

Partonic x-sections

Single SPS resolved (namely same partonic cross section as hadroproduction)

Di J/\psi photo-production@EIC

F. A. Ceccopieri, H. S. Shao, J. P. Lansberg, M. R. and R. Sangem in prep.

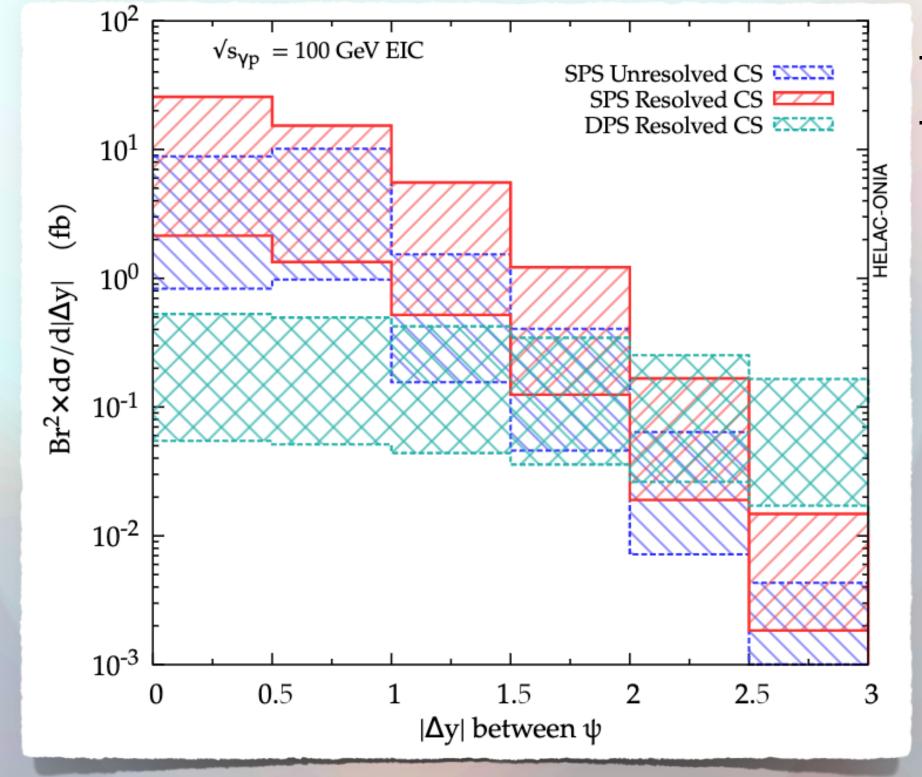

- GRV photon PDF is used PRD 46, 1973 (1992) , while CT18NLO PDF for proton T.J. Hou et al., PRD 103, 014013 (2021)
- HELAC-Onia latest version is used for generating matrix elements HS Shao, CPC 184, 2562 (2013), 198, 238 (2016)
- CO LDMEs are taken from M. Butenschoen and B. A. Kniehl, PRD 84, 051501 (2011)
- We expect at least 600 four-muon events with 100 fb⁻¹ luminosity

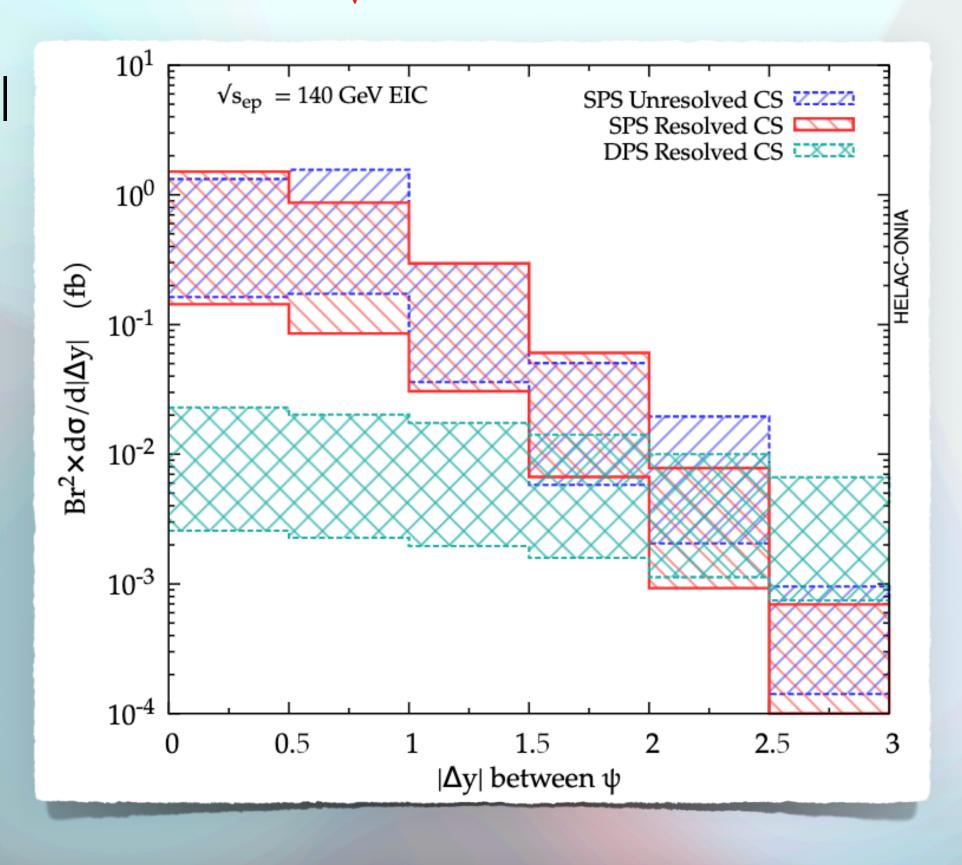

Absolute rapidity difference between the two J/ψ

$$\sqrt{s_{\gamma p}} = 100 \text{ GeV}$$

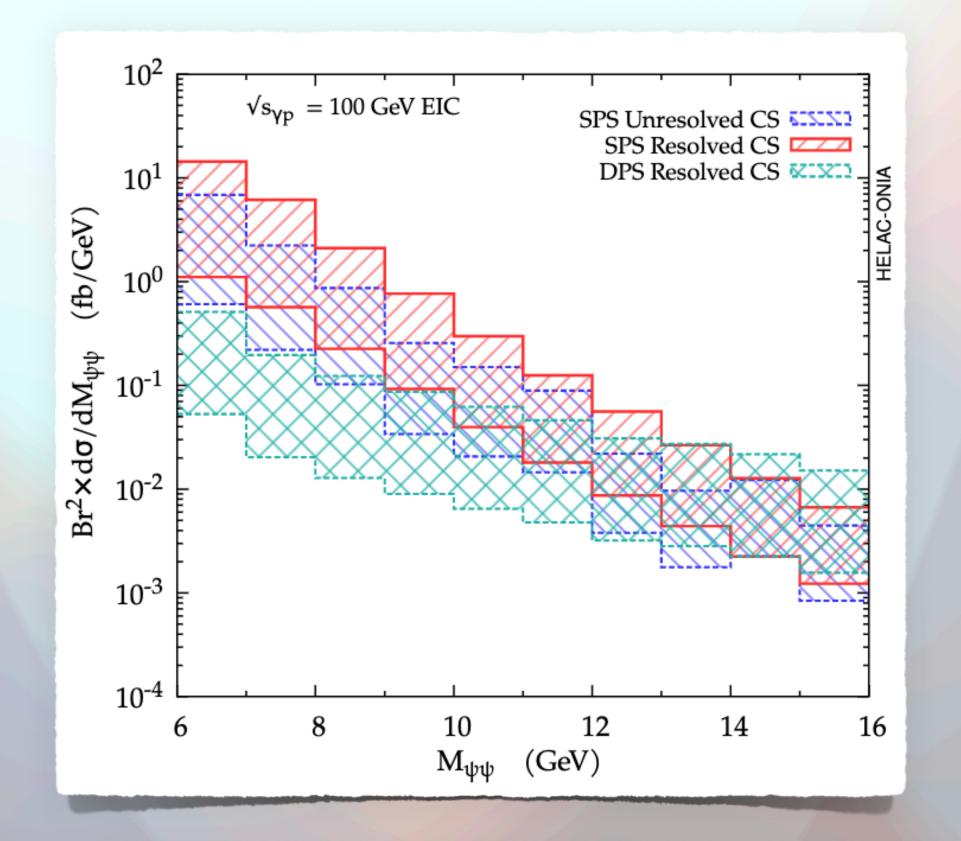

- DPS dominates at high $|\Delta y|$
- DPS is suppressed at low $|\Delta y|$

$$\sqrt{s_{\gamma p}} = 140 \text{ GeV}$$

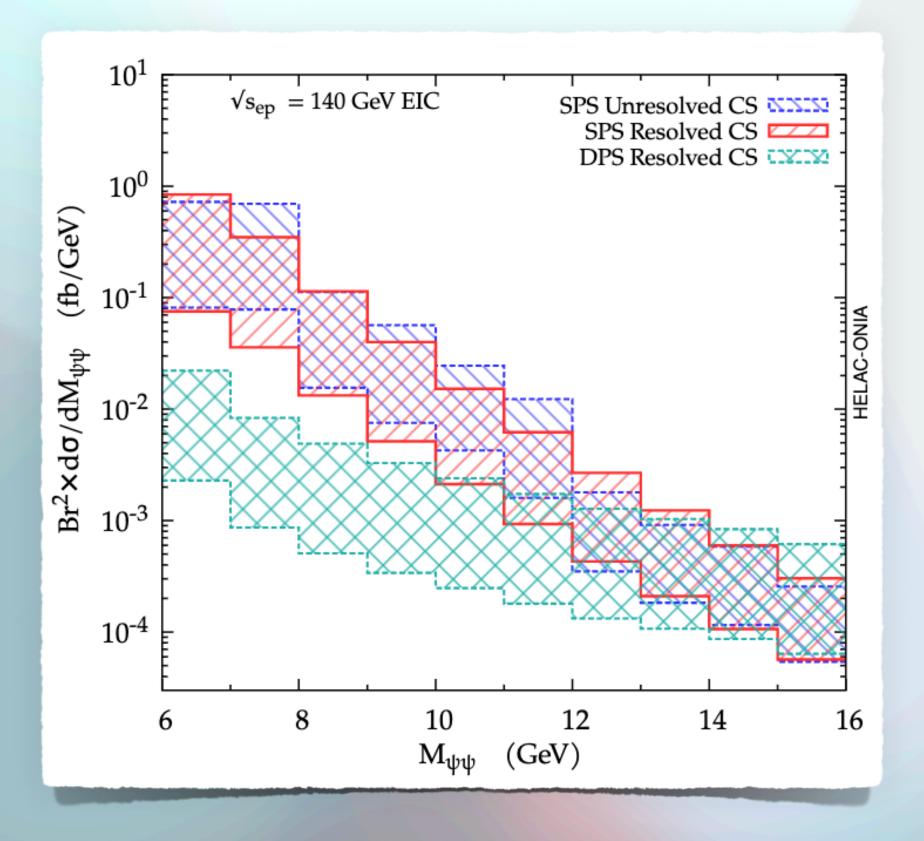

Invariant mass of the J/ψ pair

$$\sqrt{s_{\gamma p}} = 100 \text{ GeV}$$

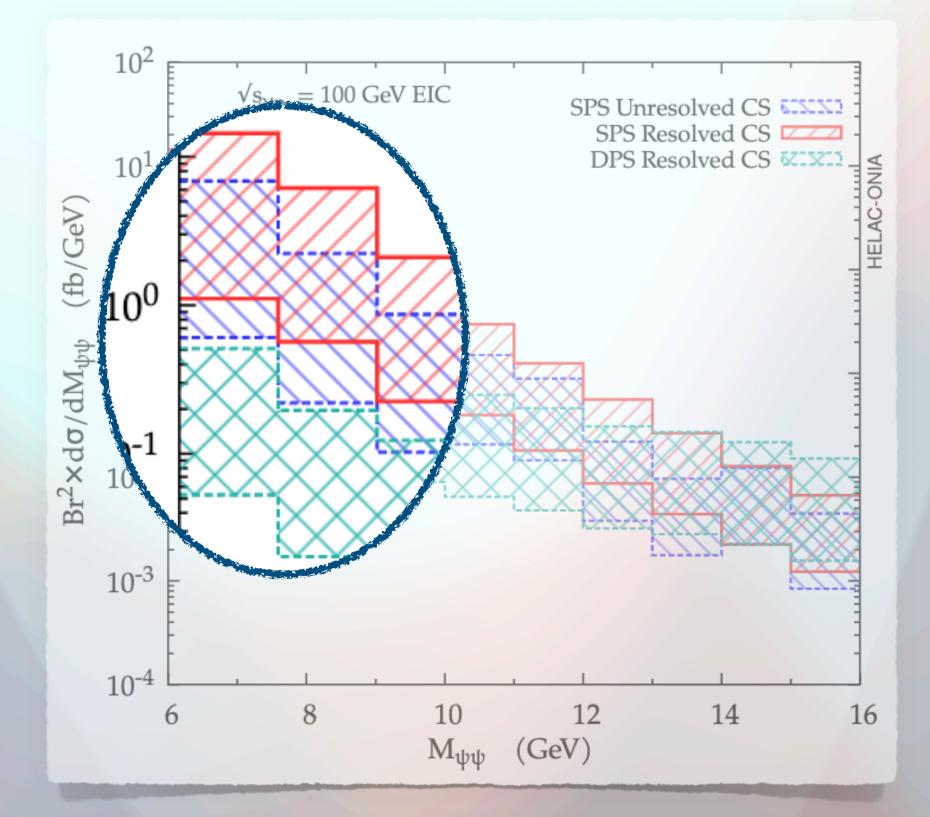

$$\sqrt{s_{\gamma p}} = 140 \text{ GeV}$$

Invariant mass of the J/ψ pair

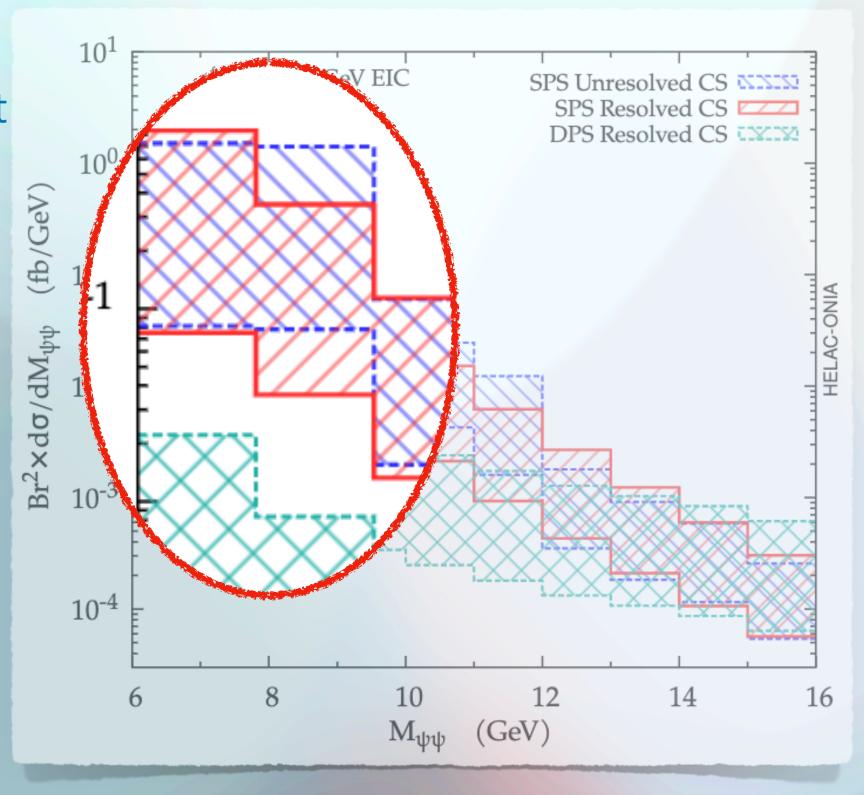

$$\sqrt{s_{\gamma p}} = 100 \text{ GeV}$$

a) at low invariant mass:

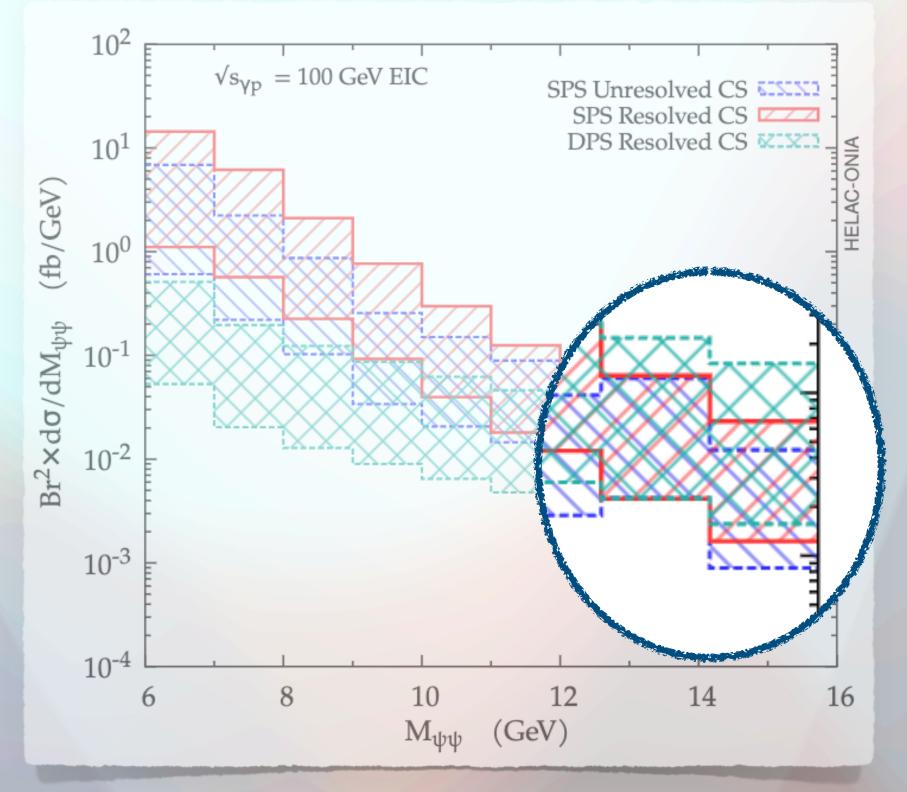

- DPS smaller then SPS, but not negligible
- DPS negligible

Invariant mass of the J/ψ pair

$$\sqrt{s_{\gamma p}} = 100 \text{ GeV}$$

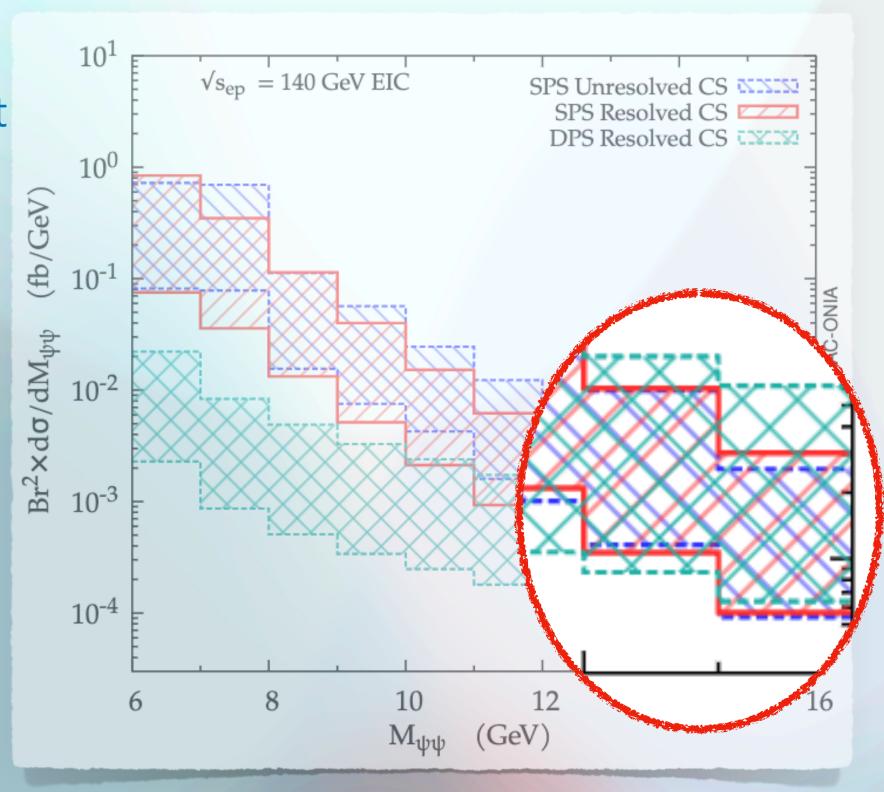

a) at low invariant mass:

- DPS smaller then SPS, but not negligible
- DPS negligible

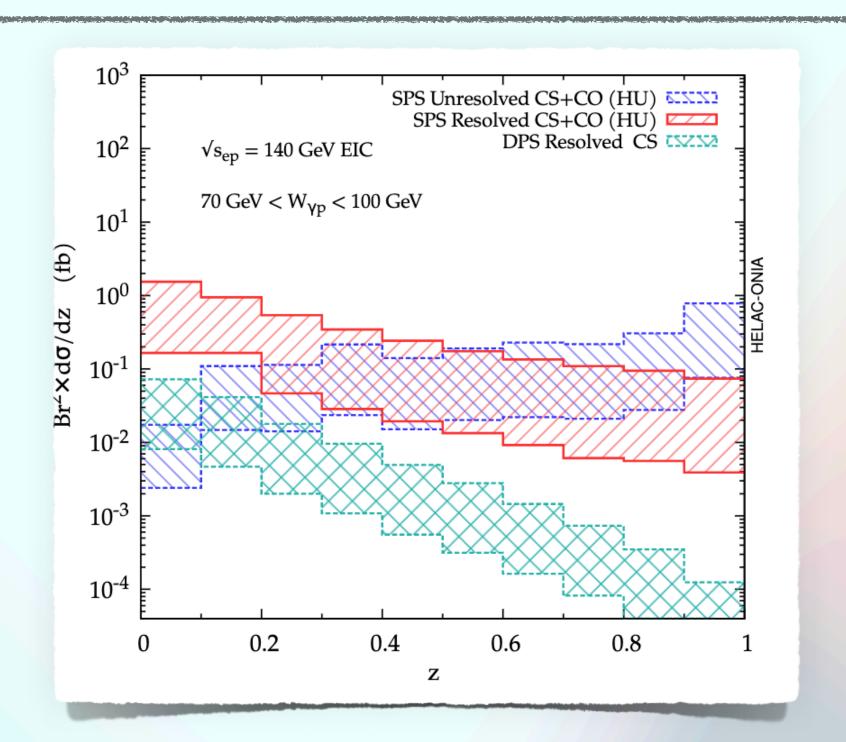

b) at low invariant mass:

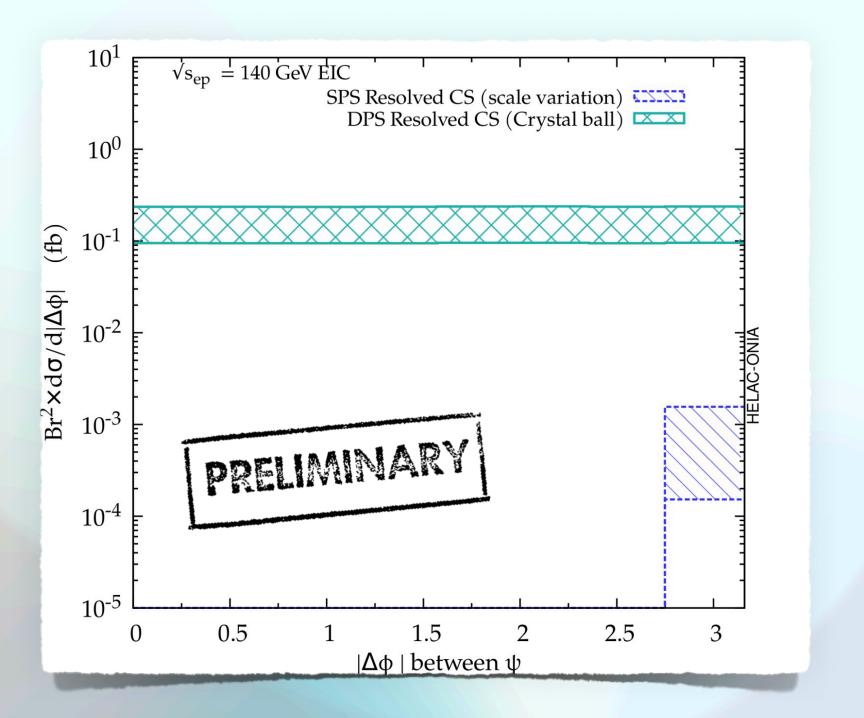

- DPS bigger then SPS
- DPS similar to SPS

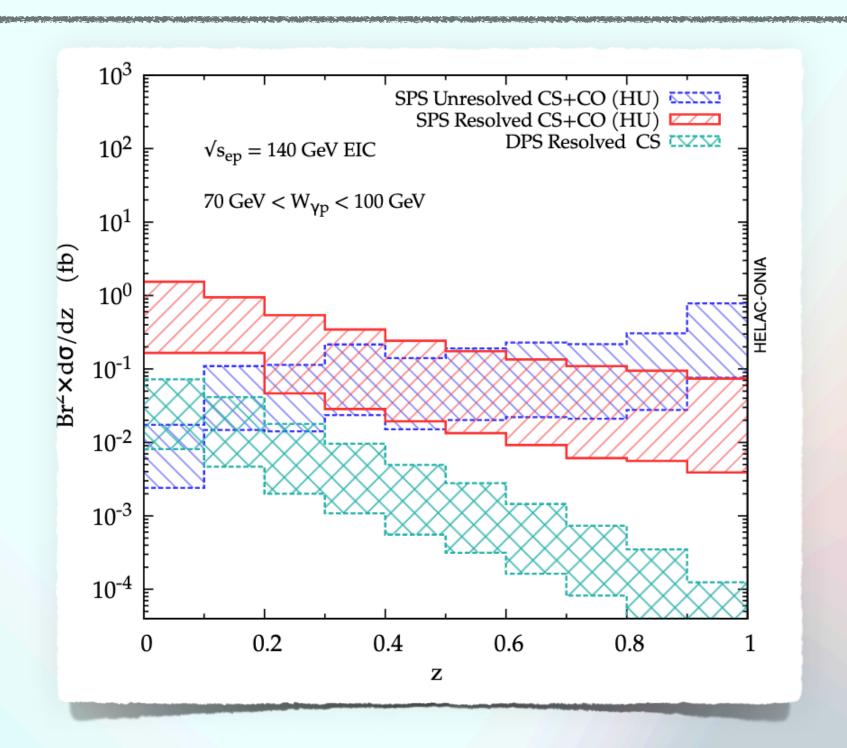

F. A. Ceccopieri, H. S. Shao, J. P. Lansberg, M. R. and R. Sangem in prep.

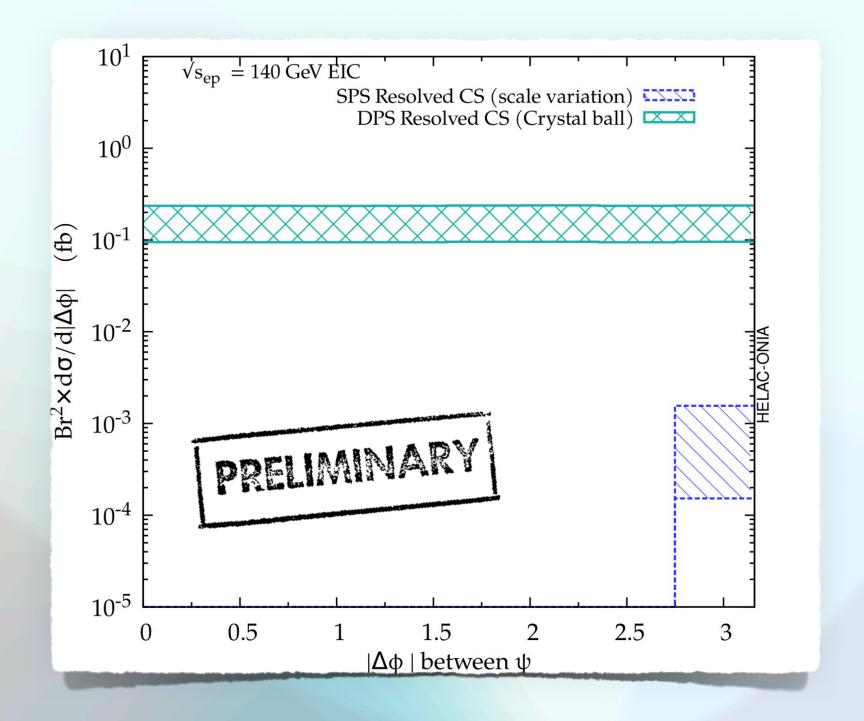

* for z<0.1, SPS resolved dominates — unique opportunity to investigate the PHOTON structure

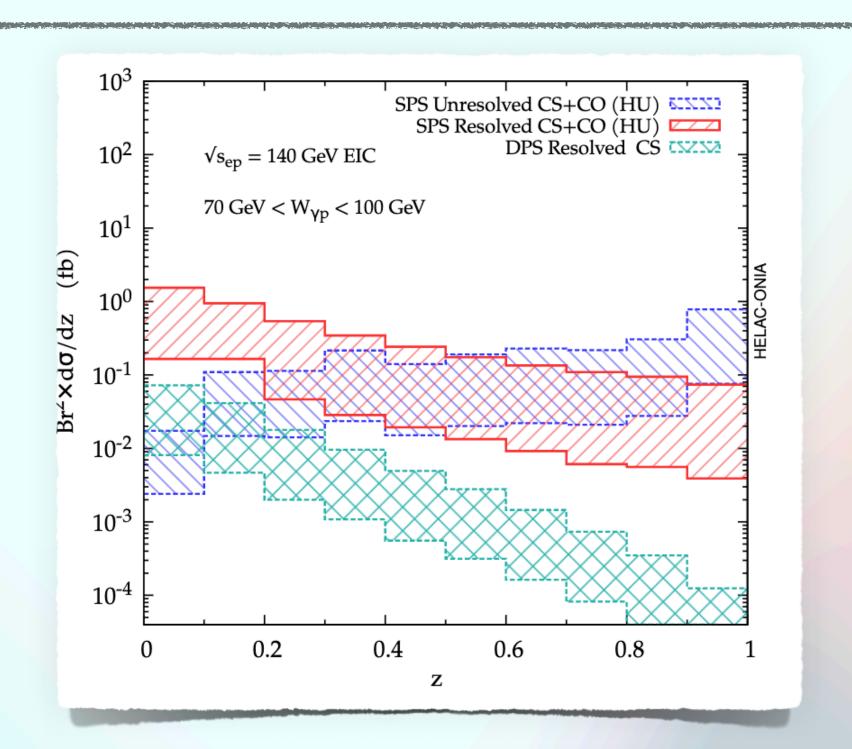

F. A. Ceccopieri, H. S. Shao, J. P. Lansberg, M. R. and R. Sangem in prep.

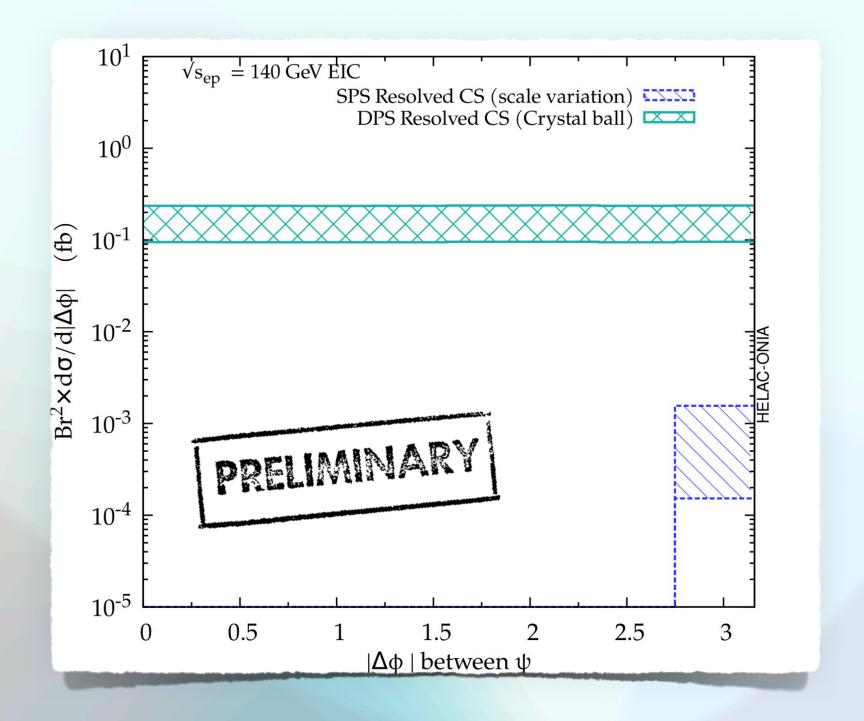

- * for z<0.1, SPS resolved dominates unique opportunity to investigate the PHOTON structure
- * for high z, the direct SPS contribution dominates we test the quarkonia production via direct photoproduction

F. A. Ceccopieri, H. S. Shao, J. P. Lansberg, M. R. and R. Sangem in prep.

- * for z<0.1, SPS resolved dominates unique opportunity to investigate the PHOTON structure
- * for high z, the direct SPS contribution dominates we test the quarkonia production via direct photoproduction
- * as for DPS studies @LHC, the cross-section dependence on the relative azimuthal angle is relevant to access the DPS contribution!

For DPS in pA and AA collisions the following references were missing:

- 1)Same-sign WW production in proton-nucleus collisions at the LHC as a signal for double parton scattering D. d'E. & A. Snigirev, PLB 718 (2013) 1395-1400
- 2)Enhanced J/ΨJ/\PsiJ/Ψ-pair production from double parton scatterings in nucleus-nucleus collisions at the Large Hadron Collider D. d'E. & A. Snigirev, PLB 727 (2013) 157-162
- 3)Pair production of quarkonia and electroweak bosons from double-parton scatterings in nuclear collisions at the LHC D. d'E. & A. Snigirev, Nucl. Phys. A 931 (2014) 303-308

and for TPS:

Triple-parton scatterings in proton-nucleus collisions at high energies D. d'E. & A. Snigirev, EPJC 78 (2018) 5, 359

See H.-S. Shao and D. d'Enterria's talks

$$egin{aligned} \mathsf{F}_{\mathsf{a}_1\mathsf{a}_2}(\mathsf{x}_1,\mathsf{x}_2,\mathsf{f y}_\perp) &= 2p^+ \int rac{dz_1^-}{2\pi} rac{dz_2^-}{2\pi} dy^- e^{i\left(x_1z_1^- + x_2z_2^-
ight)p^+} \ & imes \langle \mathsf{A} ig| \mathcal{O}_{\mathsf{a}_2}(\mathsf{0},\mathsf{z}_2) \mathcal{O}_{\mathsf{a}_1}(\mathsf{y},\mathsf{z}_1) ig| \mathsf{A}
angle \end{aligned}$$

In this case we have two mechanisms that contribute:

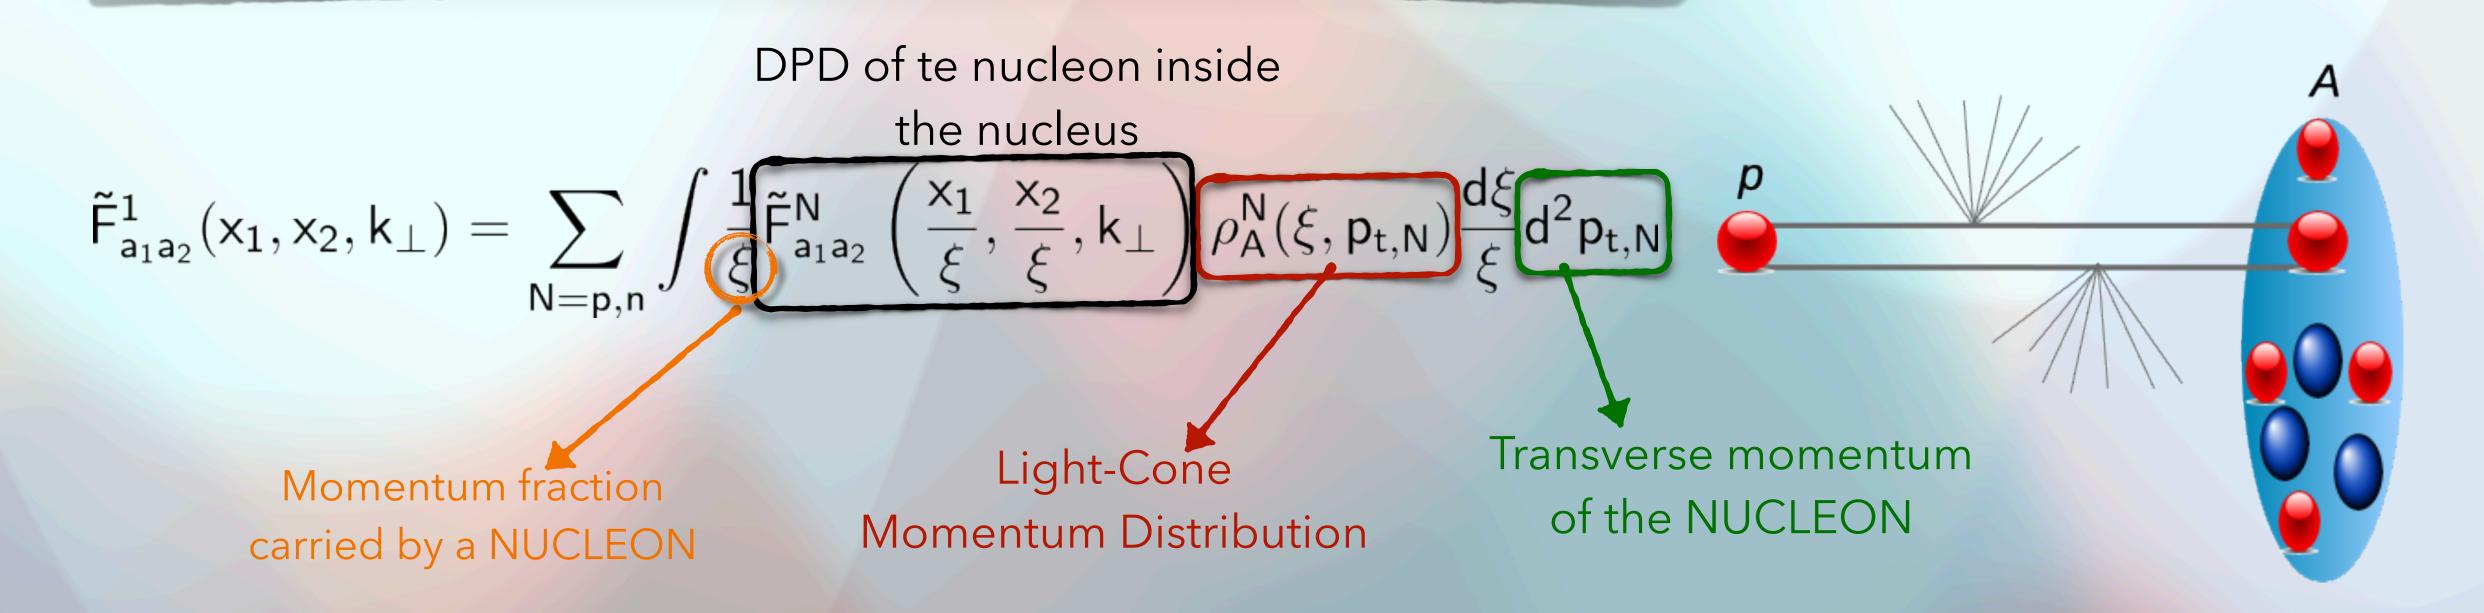

Matteo Rinaldi MPI@LHC2023 43

$$egin{aligned} \mathsf{F}_{\mathsf{a}_1\mathsf{a}_2}(\mathsf{x}_1,\mathsf{x}_2,\mathsf{f y}_\perp) &= 2p^+ \int rac{dz_1^-}{2\pi} rac{dz_2^-}{2\pi} dy^- e^{i\left(x_1z_1^- + x_2z_2^-
ight)p^+} \ & imes \langle \mathsf{A} | \mathcal{O}_{\mathsf{a}_2}(\mathsf{0},\mathsf{z}_2) \mathcal{O}_{\mathsf{a}_1}(\mathsf{y},\mathsf{z}_1) | \mathsf{A}
angle \end{aligned}$$

In this case we have two mechanisms that contribute:

B. Blok et al, EPJC (2013) 73:2422

DPS 1: The two partons belong to the SAME nucleon in the nucleus!

Matteo Rinaldi

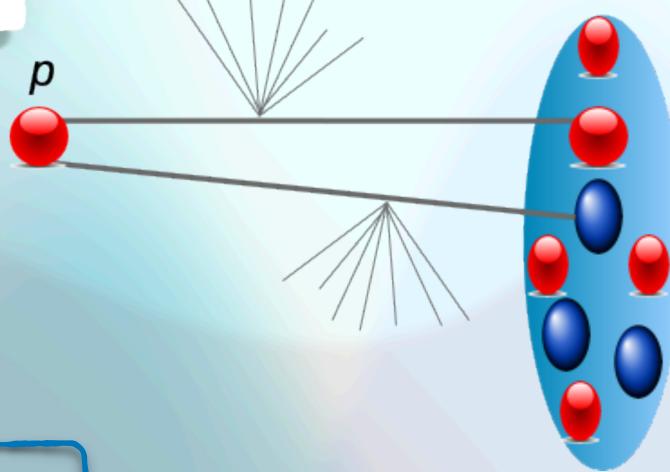

MPI@LHC2023

$$egin{aligned} \mathsf{F}_{\mathsf{a}_1\mathsf{a}_2}(\mathsf{x}_1,\mathsf{x}_2,\mathsf{f y}_\perp) &= 2p^+ \int rac{dz_1^-}{2\pi} rac{dz_2^-}{2\pi} dy^- e^{i\left(x_1z_1^- + x_2z_2^-
ight)p^+} \ & imes \langle \mathsf{A} | \mathcal{O}_{\mathsf{a}_2}(\mathsf{0},\mathsf{z}_2) \mathcal{O}_{\mathsf{a}_1}(\mathsf{y},\mathsf{z}_1) | \mathsf{A}
angle \end{aligned}$$

In this case we have two mechanisms that contribute:

B. Blok et al, EPJC (2013) 73:2422

DPS 2: The two partons belong to the DIFFERENT nucleons in the nucleus!

$$\begin{split} \tilde{\textbf{F}}_{a_{1}a_{2}}^{2}(\textbf{x}_{1},\textbf{x}_{2},\vec{\textbf{k}}_{\perp}) \propto & \int \frac{1}{\xi_{1}\xi_{2}} \prod_{i=1}^{i=A} \frac{d\xi_{i}d^{2}\textbf{p}_{ti}}{\xi_{i}} \delta \Biggl(\sum_{i} \xi_{i} - A \Biggr) \delta^{(2)} \Biggl(\sum_{i} \textbf{p}_{ti} \Biggr) \psi_{A}^{*}(\xi_{1},\xi_{2},\textbf{p}_{t1},\textbf{p}_{t2},\ldots) \\ & \times \psi_{A} \Biggl(\xi_{1},\xi_{2},\textbf{p}_{t1} + \vec{\textbf{k}}_{\perp},\textbf{p}_{t2} - \vec{\textbf{k}}_{\perp},\ldots \Biggr) \textbf{G}_{a_{1}}^{N_{1}} \Bigl(\textbf{x}_{1}/\xi_{1},|\vec{\textbf{k}}_{\perp}|\Bigr) \textbf{G}_{a_{2}}^{N_{2}} \Bigl(\textbf{x}_{2}/\xi_{2},|\vec{\textbf{k}}_{\perp}|\Bigr) \end{split}$$

Matteo Rinaldi

MPI@LHC2023

In p-Pb collisions there are some difficulties (personal view):

- 1) both cross-sections (DPS1 and DPS2) depends on proton DPD (still almost unknown) therefore both mechanisms are very important could be difficult to extract some information on the proton DPD
- 2) for heavy nuclei is difficult to perform calculation with wave-function obtained from realistic potentials

POSSIBLE SOLUTION?

- 1) In γA the DPS2 will not contain any DPD of the proton this mechanism can now be viewed as a background that can be evaluated if we properly treat the photon (as previously discussed) and the Nuclear geometry
- 2) For light nuclei these calculations can be done starting from realistic wave-function (Av18 or chiral potential)!

Could we access the DPD of bound nucleons? Double EMC effect?

Matteo Rinaldi MPI@LHC2023 49

For example in DPS1:

$$\tilde{F}_{a_{1}a_{2}}^{1}(x_{1},x_{2},k_{\perp}) = \sum_{N=p,n} \int \frac{1}{\xi} \tilde{F}_{a_{1}a_{2}}^{N} \left(\frac{x_{1}}{\xi}, \frac{x_{2}}{\xi}, k_{\perp} \right) \boxed{\rho_{A}^{N}(\xi,p_{t,N})} \frac{d\xi}{\xi} d^{2}p_{t,N}$$

The nuclear light-cone distribution can be evaluated with realistic wave-function (from Av18 +UIV potential) in a fully relativistic and Poincaré covariant approach for:

- 1) H² in E. Pace and G. Salmé, TNPI2000 (2001), arXiv:nucl-th/0106004
- 2) He³ in e.g. A. Del Dotto et al, PRC 95, 014001 (2017), M.R. et al, PLB 839 (2023), 137810
- 3) He4work in progress

For example in DPS2:

$$\begin{split} \tilde{\textbf{F}}_{a_{1}a_{2}}^{2}(\textbf{x}_{1},\textbf{x}_{2},\vec{\textbf{k}}_{\perp}) &\propto \int \frac{1}{\xi_{1}\xi_{2}} \prod_{i=1}^{i=A} \frac{d\xi_{i}d^{2}p_{ti}}{\xi_{i}} \, \delta\!\left(\sum_{i} \xi_{i} - A\right) \! \delta^{(2)}\!\left(\sum_{i} \mathbf{p}_{ti}\right) \! \psi_{A}^{*}(\xi_{1},\xi_{2},p_{t1},p_{t2}) \psi_{A}\!\left(\xi_{1},\xi_{2},p_{t1} + \vec{\textbf{k}}_{\perp},p_{t2} - \vec{\textbf{k}}_{\perp}\right) \\ &\times G_{a_{1}}^{N_{1}}\!\left(\frac{\textbf{x}_{1}}{\xi_{1}},|\vec{\textbf{k}}_{\perp}|\right) \! G_{a_{2}}^{N_{2}}\!\left(\frac{\textbf{x}_{2}}{\xi_{2}},|\vec{\textbf{k}}_{\perp}|\right); \\ &\underset{\xi_{i} \sim 1}{\sim} G_{a_{1}}^{N_{1}}\!\left(\textbf{x}_{1},|\vec{\textbf{k}}_{\perp}|\right) \! Backup - Luminosity I

To test if in future a dependence of the effective cross section on the photon virtuality could be observed, we considered again the 4 JET photoproduction:

1) We divided the integral of the cross section on Q² in two intervals:

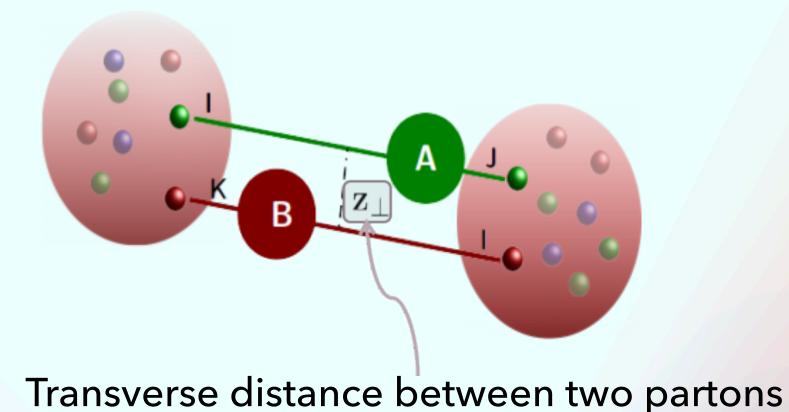

$$Q^2 \le 10^{-2}$$
 and $10^{-2} \le Q^2 \le 1$ GeV²

2) We have estimated for each photon and proton models a constant effective cross section (with respect to Q^2) such that the total integral of the cross section on Q^2 reproduce the full calculation obtained by means of $\sigma_{\rm eff}^{\gamma p}(Q^2)$

3) We estimate the minimum luminosity to distinguish the two cases

Double Parton Scattering

Multiparton interaction (MPI) can contribute to the, pp and pA, cross section @ the LHC:

$$d\sigma \propto \int d^2z_{\perp} F_{ij}(x_1, x_2, z_{\perp}, \mu_A, \mu_B) F_{kl}(x_3, x_4, z_{\perp}, \mu_A, \mu_B)$$

Double Parton Distribution (DPD)

N. Paver and D. Treleani, Nuovo Cimento 70A, 215 (1982) Mekhfi, PRD 32 (1985) 2371 M. Diehl et al, JHEP 03 (2012) 089

A formal all-order proof of the factorization formulae in perturbative QCD has been achieved for DPS in the case of a colorless final state, both for the TMD and the collinear case. Current status is at the same level as for the SPS counterpart.

all UNKNOWN

Backup - $\sigma_{\rm eff}^{\gamma p}(Q^2 \to \infty)$

1) we show that high virtual behavior of the effective cross sections correctly follows the result in **J.R. Gaunt JHEP 01, 042 (2013)**, i.e.:

$$\sigma_{eff}^{\gamma p}(Q^2 \to \infty) = \sigma_{1v2}^{pp} = \left[\int \frac{d^2 k_{\perp}}{(2\pi)^2} T_p(k_{\perp}) \right]^{-1}$$

2) In Ref. M.Rinaldi and F.A: Ceccopieri JHEP 09, 097 (2019), we prove, in a general framework:

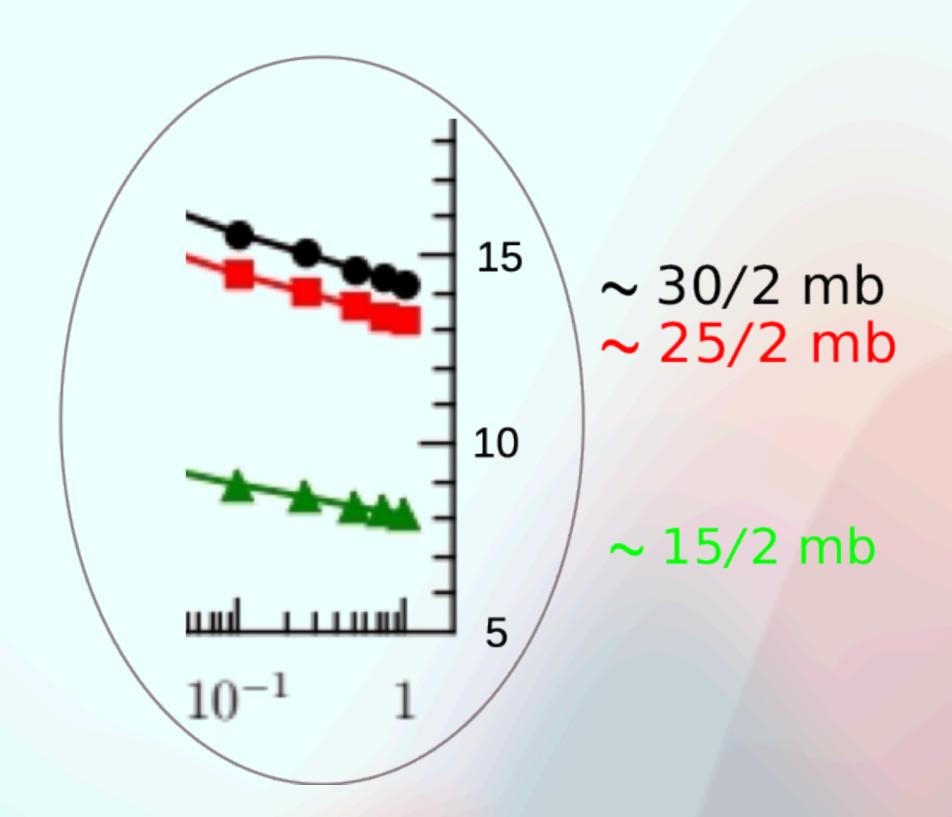

$$\frac{\pi}{2} \langle b^2 \rangle \le \sigma_{eff}^{\gamma p} (Q^2 \to \infty) \le 2\pi \langle b^2 \rangle$$

Being:
$$\sigma_{\rm eff}^{\gamma p}(Q^2 \to \infty) = \sigma_{\rm eff}^{2v1}$$

$$\frac{\sigma_{eff}^{pp}}{6} \leq \sigma_{eff}^{\gamma p}(Q^2 \to \infty) \leq 2 \sigma_{eff}^{pp}$$
 Extracted from data

Matteo Rinaldi MPI@LHC2023

Backup - $\sigma_{eff}^{\gamma p}(Q^2 \to \infty)$

$$[\sigma_{eff}^{\gamma p}(Q^2)]^{-1} = \int \frac{d^2k_{\perp}}{(2\pi)^2} T_p(k_{\perp}) T_{\gamma}(k_{\perp}; Q^2)$$

$$[\sigma_{eff}^{\gamma p}(Q^2)]^{-1} \sim \int_{Q^2>>1} \frac{d^2k_{\perp}}{(2\pi)^2} T_p(k_{\perp}) \times 1$$

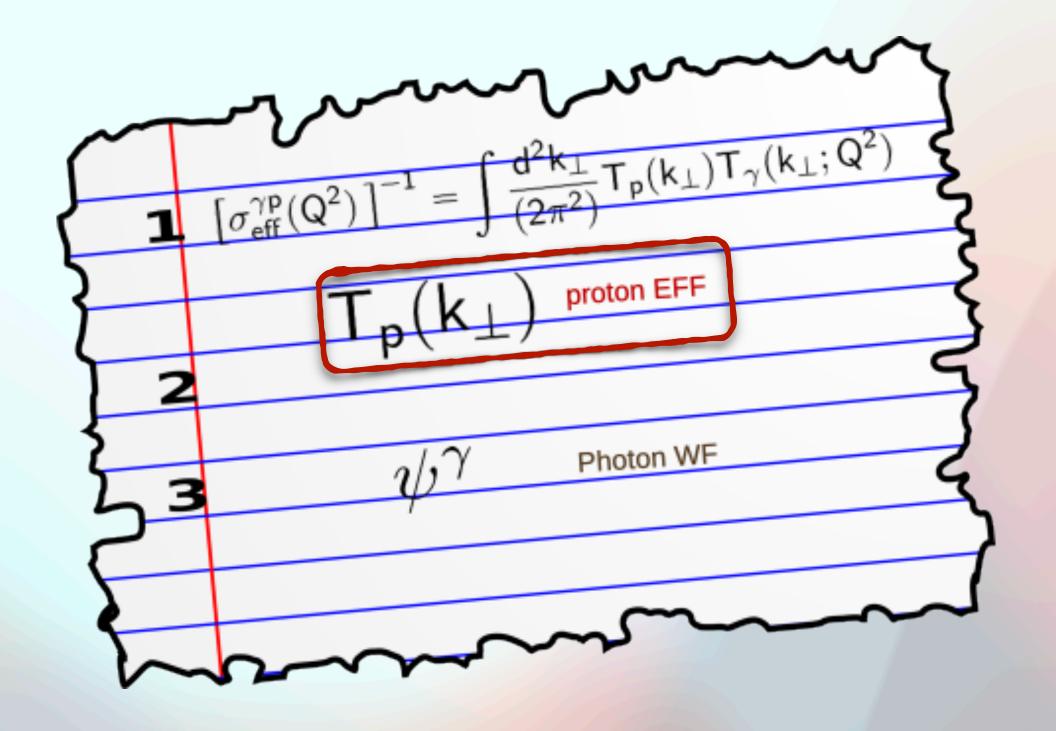

For the proton models we have used:

$$\int \frac{d^2k_{\perp}}{(2\pi)^2} T_p(k_{\perp}) \sim 2 \int \frac{d^2k_{\perp}}{(2\pi)^2} T_p(k_{\perp})^2$$

$$\sigma_{eff}^{\gamma p}(Q^2 >> 1 \text{ GeV}^2) \sim \sigma_{eff}^{pp}/2$$

Thus for QED: $Q^2 > 1 \text{ GeV}^2$ almost approximates the asymptotic

Matteo Rinaldi MPI@LHC2023 The main ingredients of the calculations:

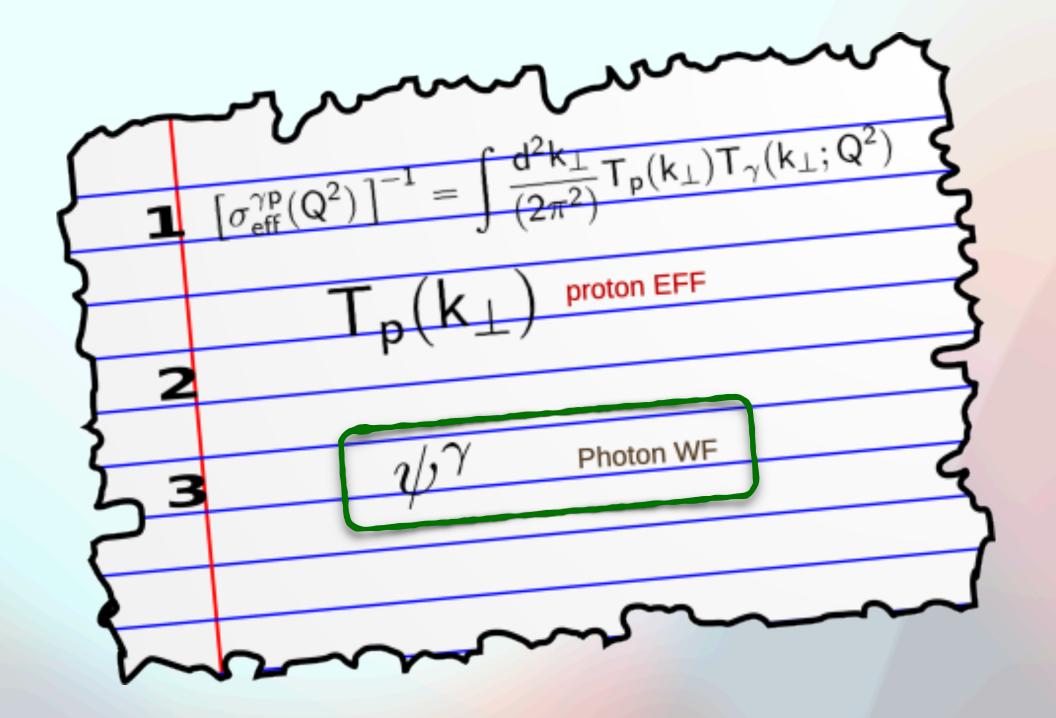

For the proton EFF use has been made of three choices:

1) G1
$$e^{-\alpha_1 k_{\perp}^2}$$
, $\alpha_1 = 1.53 \text{ GeV}^{-2} \Longrightarrow \sigma_{\text{eff}}^{pp} = 15 \text{ mb}$

2) G2
$$e^{-\alpha_2 k_\perp^2}$$
, $\alpha_2 = 2.56 \text{ GeV}^{-2} \Longrightarrow \sigma_{\text{eff}}^{pp} = 25 \text{ mb}$

3) S
$$\left(1 + \frac{k_\perp^2}{m_g^2}\right)^{-4}$$
, $m_g^2 = 1.1~{\rm GeV}^2 \Longrightarrow \sigma_{\rm eff}^{pp} = 30~{\rm mb}$

The main ingredients of the calculations:

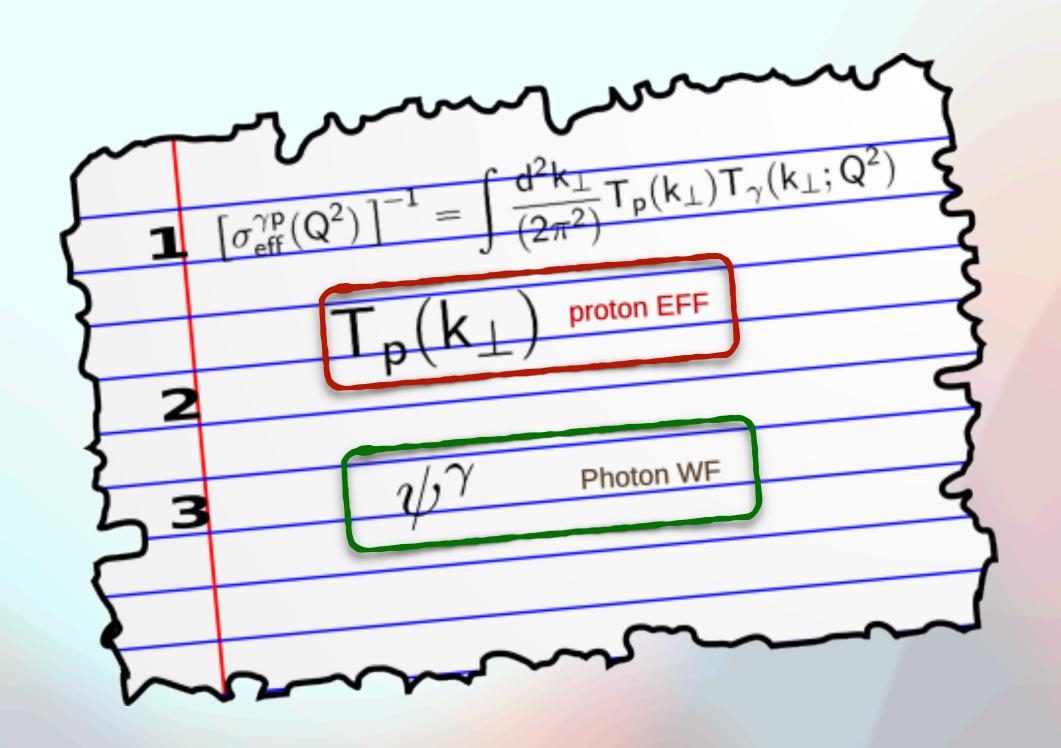

For the photon W.F. use has been made of two choices representing two extreme cases:

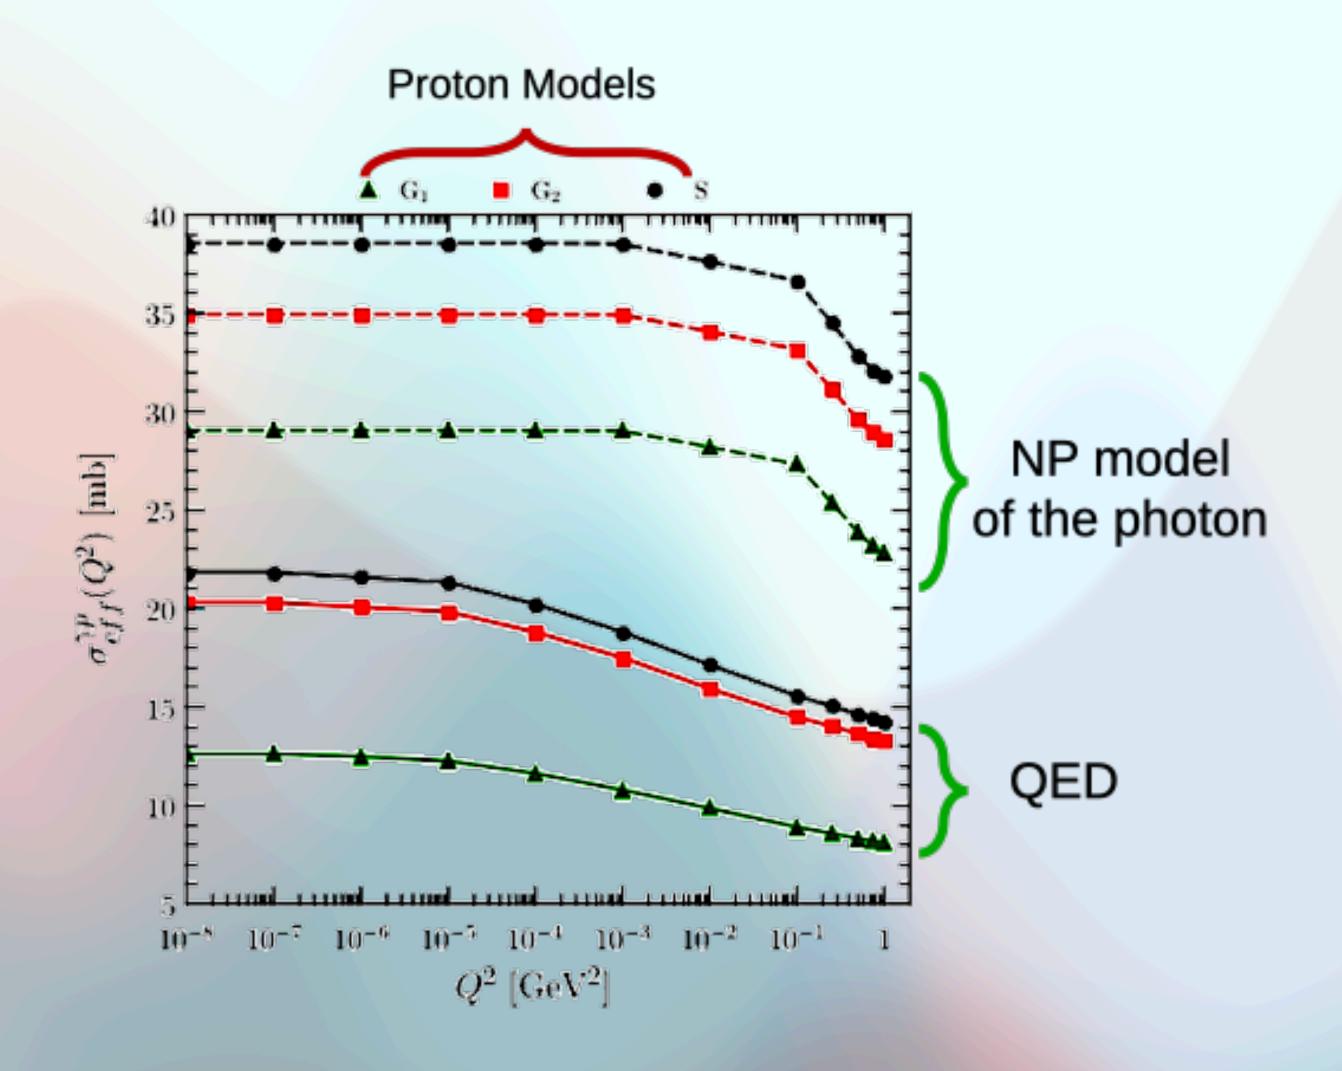

1) QED at LO (S.J. Brodsky et al. PRD50, 3134 (1994)):

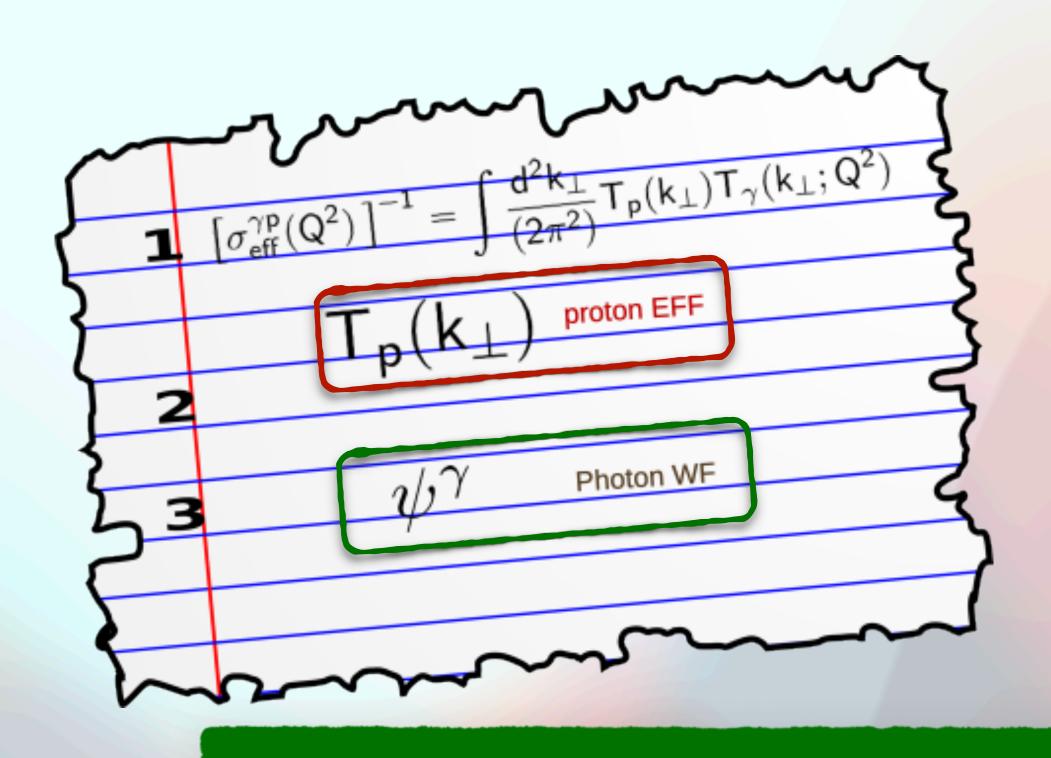

$$\begin{split} \psi_{q,\bar{q}}^{\lambda=\pm}(x,k_{1\perp};Q^2) &= -e_f \frac{\bar{u}_q(k) \; \gamma \cdot \varepsilon^{\lambda} \; v_{\bar{q}}(q-k)}{\sqrt{x(1-x)} \left[Q^2 + \frac{k_{1\perp}^2 + m^2}{x(1-x)}\right]} \end{split}$$

2) Non-Pertubative (NP) effects (E.R.Arriola et al, PRD74,054023 (2006))

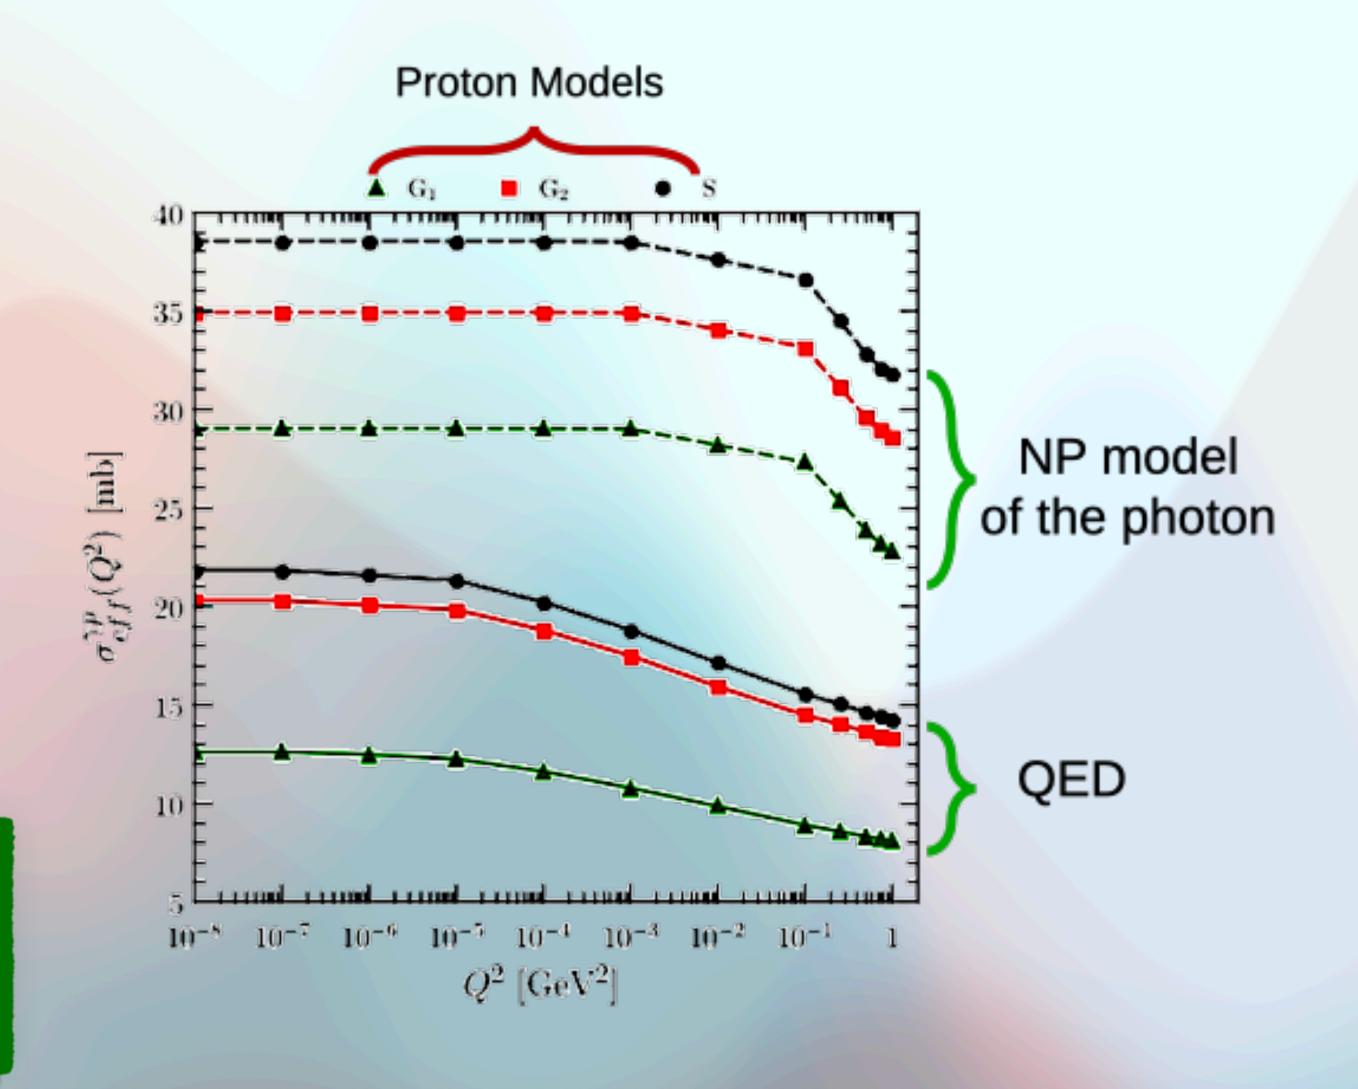

$$\begin{split} \psi_{A}^{\gamma}(x,k_{\perp 1};Q^2) &= \frac{6(1+Q^2/m_{\rho}^2)}{m_{\rho}^2 \left(1+4\frac{k_{\perp 1}^2+Q^2x(1-x)}{m_{\rho}^2}\right)^{5/2}} \end{split}$$

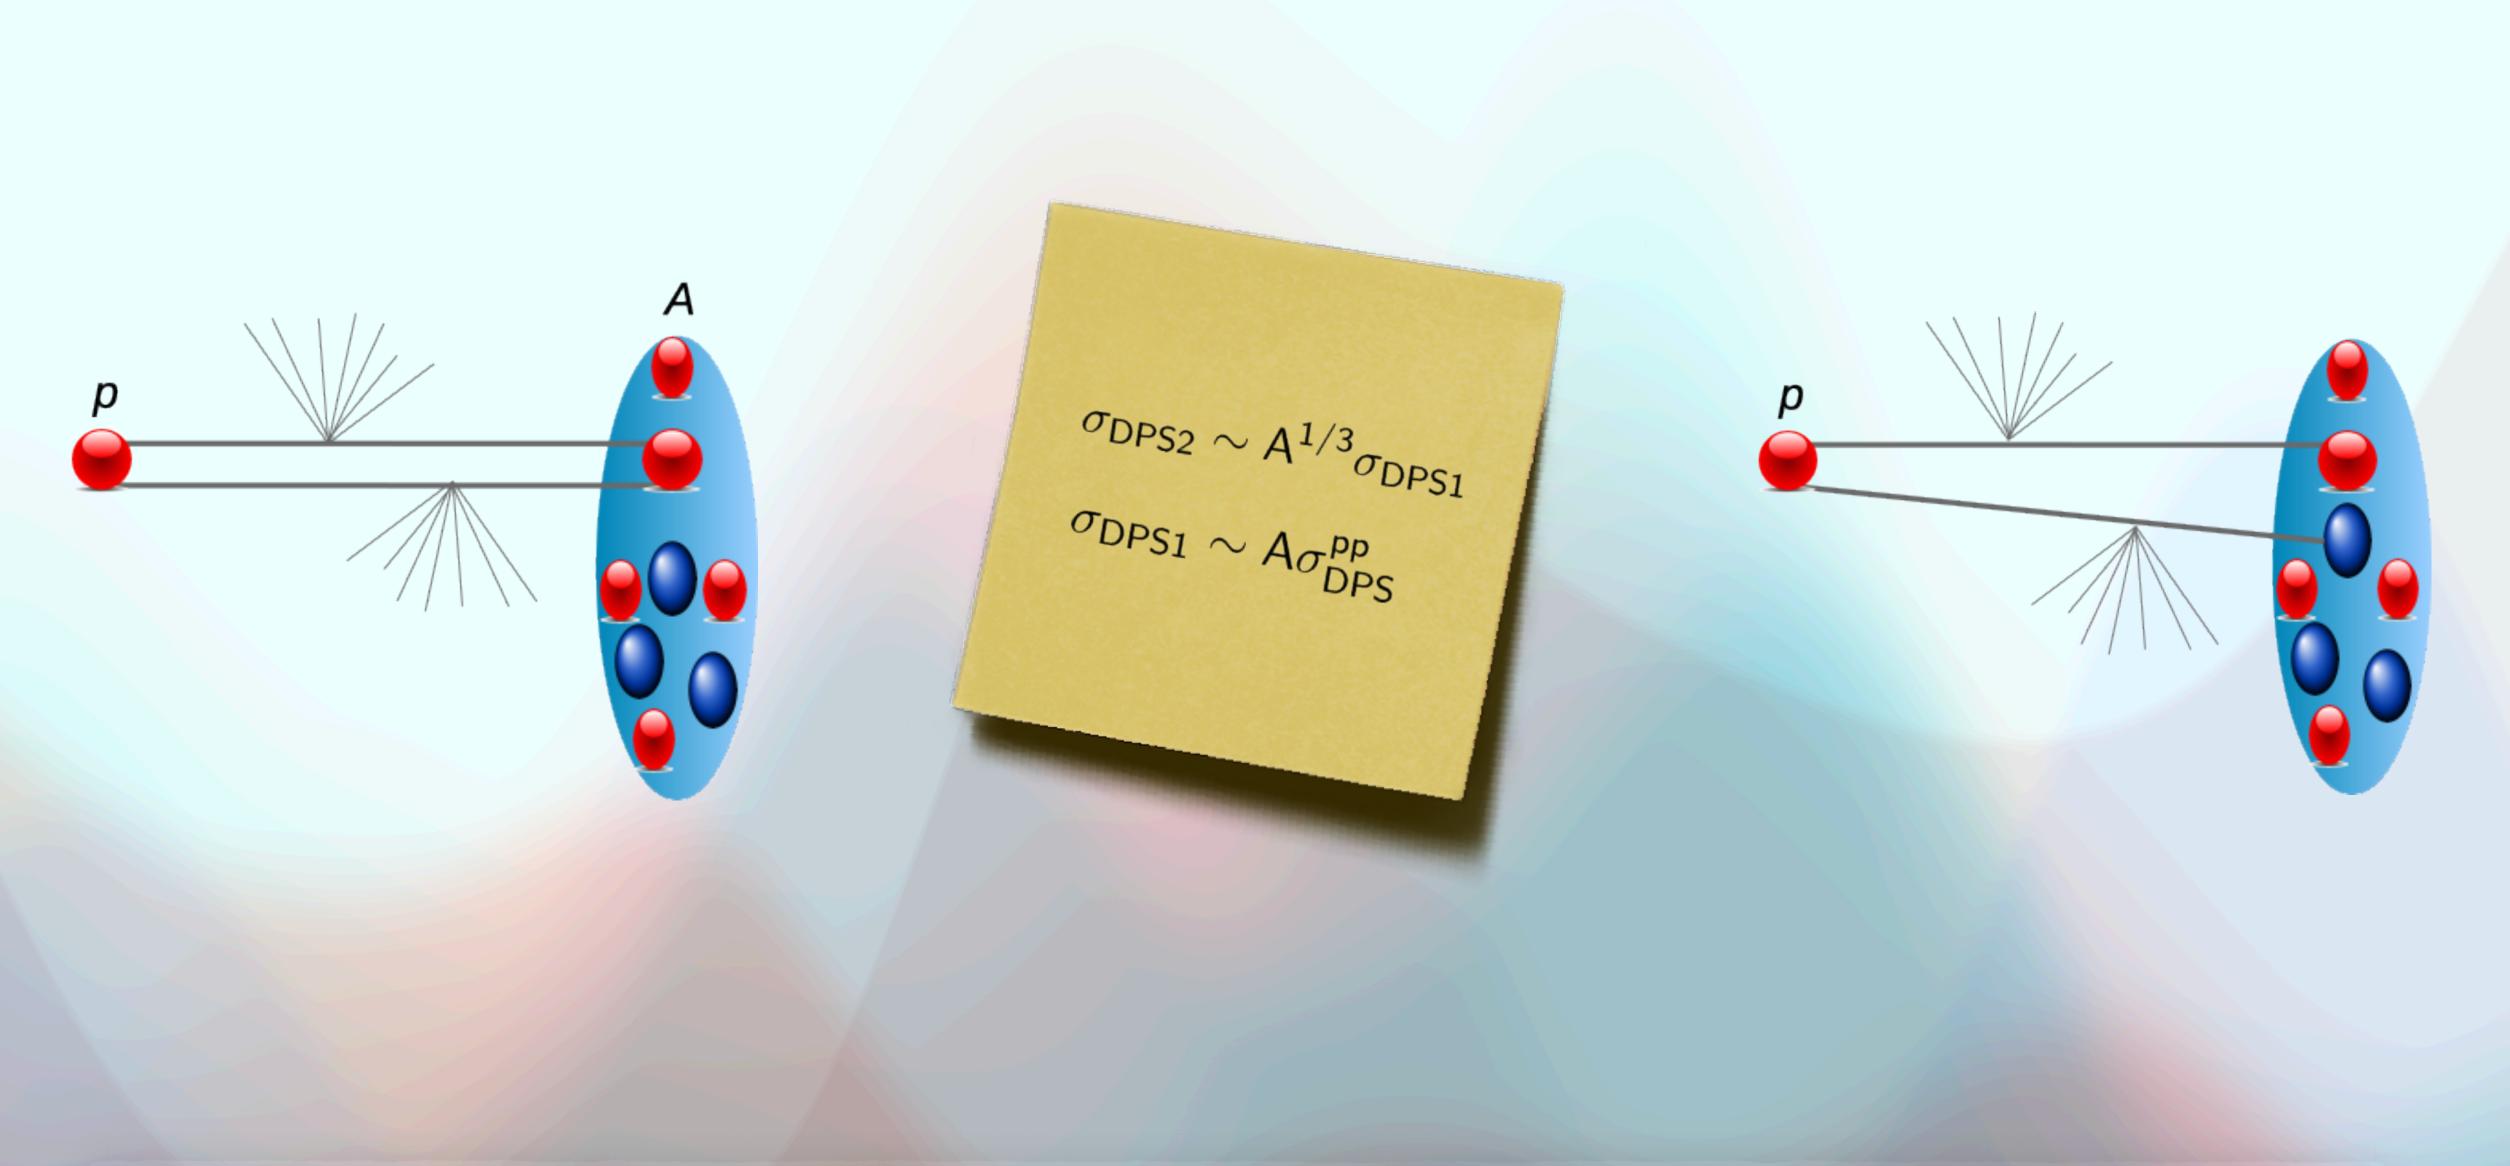

The effective cross-section depends on the photon virtuality! (NEW)
