Imaging Resolution

#### Motivation

- Neutron capture cross-section measurements:
  - Astrophysical interest:
    - s-process of nucleosynthesis
  - Typical experiment:
    - Neutron time of flight
  - Major challenges:
    - Direct neutron background
    - Neutron-induced background

Figure 1: Scheme of the neutron-capture processes, including the s-process path, relevant for the motivation of the present work.

B.Gameiro, J.Lerendegui-Marco, J.Hallam, J.Balibrea-Correa, I.Ladarescu, C.Domingo-Pardo, V.Babiano-Suárez

#### Motivation

- Neutron capture cross-section measurements:
  - Astrophysical interest:
    - s-process of nucleosynthesis
  - Typical experiment:
    - Neutron time of flight
  - Major challenges:
    - Direct neutron background
    - Neutron-induced background

Background Suppression

#### Motivation

- Neutron capture cross-section measurements:
  - Astrophysical interest:
    - s-process of nucleosynthesis
  - Typical experiment:
    - Neutron time of flight
  - Major challenges:
    - Direct neutron background
    - Neutron-induced background

Figure 3: Scheme of a neutron capture to an excited state and possible decays to ground state by emission of different  $\gamma$ -ray cascades.

### Major challenges

#### • Direct neutron background:

- Neutrons scattered on the target
- Detector requirement: ↓ neutron sensitivity

#### • Neutron-induced $\gamma$ background:

- Neutrons interact with environment
- Detector requirement: select  $\gamma$  events

Figure 4: Possible interactions.

FNUC (XV CPAN)

Imaging Resolution

Background Suppression

#### Solution

• Imaging:

- Select events based on spatial origin
- i-TED
  - Total-energy detector
  - Imaging capabilities
  - Compton camera
- Main features:
  - Different requirements sometimes pull development in opposing ways

# Figure 5: Working principle of a Compton camera.

B.Gameiro, J.Lerendegui-Marco, J.Hallam, J.Balibrea-Correa, I.Ladarescu, C.Domingo-Pardo, V.Babiano-Suárez

Imaging Resolution

Background Suppression

# Detectors: Multi i-TED Array

- i-TED modules ×4:
  - 2 planes per module
  - 1+4 crystals+SiPM per module
  - 8×8 pixels per SiPM
  - Total of 1280 channels!

#### • Innovative system:

- Currently C<sub>6</sub>D<sub>6</sub> are used
- Adds spatial discrimination for  $\gamma$ -rays
- Adds complexity to the system

#### • Current status:

- Years of development
- First experimental results of  ${}^{79}Se(n,\gamma)$
- Working, optimized, characterized

Figure 6: Multi i-TED detector system in its first experimental campaign.

Background Suppressior

#### Detectors: i-TED-E Module

- New addition to the lab!
- For testing and applications:
  - Range verification in hadrontherapy
  - Nuclear waste verification
  - Dosimetry in boron-neutron capture therapy
  - Radio-guided surgery
- Enter i-TED-E:
  - Working, characterized
  - First experimental campaign (CMAM 2023/06)
  - Upcoming experimental campaign (ILL 2023/10)

Figure 7: i-TED-E with its full metal casing and without the  $^{6}$ Li neutron shield

# Imaging algorithms

#### • Algorithms:

- Back-projection
- Analytical
- Stochastic Origin Ensemble
- Back-projection:
  - Origin probability
  - Simple & fast
  - Smooth peak

# • Analytical:

- Origin probability
- Better peak to background ratio
- Artifacts

Figure 8: Comparison of results of different imaging algorithms.

Background Suppression

#### Figures of Merit and Validation

- Objective: Spatial cuts
- Problem:

Imaging doesn't give coordinates

• Solution:

Need for other figures of merit

#### • Validation:

Experimentally verify applicability

Figure 11: Back-projection of the Compton cone onto source plane.

B.Gameiro, J.Lerendegui-Marco, J.Hallam, J.Balibrea-Correa, I.Ladarescu, C.Domingo-Pardo, V.Babiano-Suárez

Optimization of imaging techniques for background suppression of stellar Nucleo-Synthesis reactions with i-TED

Imaging Resolution

Background Suppression

#### FoM proposed

#### • Figures of merit:

- Lambda
- Angular Resolution Measure
- Compton Angle

#### • Experimental setup:

- Validation at different energies
- Validation based on spatial or spatial-related information

Figure 12: Experimental setup to study the background suppression applicability of different FoM. <sup>22</sup>Na source placed in front, side and back of i-TED-A module.

Imaging Resolution

Background Suppression

#### The ARM

• Angular difference between the Compton angle calculated assuming the source was in the center of the origin plane and the Compton angle calculated from the energies deposited

$$\begin{array}{l} \mathsf{ARM} = \theta_{\mathsf{Position}} - \theta_{\mathsf{Energy}} \\ = \arccos\left(\frac{\vec{S} \cdot \vec{A}}{||S||||A||}\right) - \arccos\left(1 + \frac{m_{\mathrm{e}^{-}}}{E_{T}} - \frac{m_{\mathrm{e}^{-}}}{E_{A}}\right) \end{array}$$

Figure 15: Definition of the Angular Resolution Measure.

Imaging Resolution

Background Suppression

#### The Compton Angle

 It's the angle between the incoming and the outgoing γ-ray, defined by:

$$\cos\theta = 1 - \left(\frac{m_e c^2 E_s}{E_a E_t}\right)$$

Figure 19: Definition of the Compton angle.

B.Gameiro, J.Lerendegui-Marco, J.Hallam, J.Balibrea-Correa, I.Ladarescu, C.Domingo-Pardo, V.Babiano-Suárez

Imaging Resolution

Background Suppression

Conclusion

#### The Compton Angle

Backprojection: 511keV, no cuts

Figure 20: Effect of Compton Angle cut on imaging (3 pos).

#### Figure 21: Effect of Compton Angle cut on energy spectra.

B.Gameiro, J.Lerendegui-Marco, J.Hallam, J.Balibrea-Correa, I.Ladarescu, C.Domingo-Pardo, V.Babiano-Suárez

FNUC (XV CPAN)

Imaging Resolution

#### The Compton Angle

#### • Method:

- 3 position of <sup>22</sup>Na
- Normalized to less restrictive cut
- Integral of peak over background spectrum taken
- Result:
  - Improved signal-to-background
  - Clear difference between the behavior of events spatially in front and in other positions

Figure 22: Restrictive cuts using the Compton Angle to suppress events based on spatial origin.

#### Outlook

#### • Limitations:

- Experimental vs simulation
- Impossible to completely classify good events
- Having bad events as part of the data degrades the validation

#### • Proposed:

- Monte Carlo simulation
- Label the events properly
- Study for more positions
- Feature selection
- Space selection
- Study applicability of Machine Learning

- 2 Detectors and updates
- 3 Imaging Resolution
- 4 Background Suppression

Imaging Resolution

#### Summary

#### • i-TED modules:

- Multi i-TED array for astrophysics
- i-TED-E for applications
- Upgrades:
  - Per-pixel threshold
  - Thermal gain drift correction
  - CRT for PET mode
- Imaging:
  - Comparison of algorithms
  - Position sensitivity
  - Impact of focal distance

#### • Suppression:

- Extended study of previous FoM
- Two FoM that yield better results
- Proposed future steps

#### FNUC (XV CPAN)

# Counting rate, not efficiency

- For a Compton camera, efficiency is a very complex topic
- In Compton mode, the efficiency of a given  $\gamma\text{-ray}$  depends on:
  - Energy
  - Distance to detector
  - Angle of position
  - Distance between planes
  - Different energy depositions in each plane

ntroduction 000000	Detectors and updates	Imaging Resolution	Background Suppression	Conclusion 00
TOF detector				

#### Characterization of neutron flux:

- Previous characterization:
  - TOF detector
  - Thin scintillator
  - Very fast response
- During the experiment:
  - Neutron monitors
  - Validate flux
  - $\gamma$  flash measured with main detector setup

Figure 42: Neutron flux at both experimental areas of n TOF.

FNUC (XV CPAN)

#### Parallel single2trees

- Interaction reconstruction
- Created .root files from binary files
- New version with modularity in mind:
  - Data pipeline:
    - Prefect
  - Big data and distribution:
    - Dask
  - Performance:
    - Numba
    - Rapids
    - CuPy

#### Scientific Data Management

- Intake: Python module
- Data saved in YAML file
- •
- Improvements:
  - Works regardless of file format
  - Adds metadata
  - Abstracts how to access files
  - Allows central data storage
  - Possibility of adding comments to measurement data

Background Suppressior

#### Range verification in hadrontherapy

- PET imaging widely used in medical physics
- PET vs Compton modes:
  - Compton can use different energy  $\gamma$ -rays
  - Compton has larger FOV
  - Compton uses prompt  $\gamma\text{-rays}$  that closely correlate to the Bragg peak
  - PET uses products of reactions that decay by  $\beta^+$  and are subject to biological washup

Figure 48: Four i-TED modules during a study under clinical conditions at the Heidelberg Hadrontherapy Center.
