# Federico's comments

- Excuse not being able to attend the meeting
- We must look at these plots in more detail
- We're still unsure about the bunch length values (Possibly wrong)
- Look for number of high intensity cycles that reached the flat top. We will be looking the max rate of these cycles, counting them per hour or per 10 minutes after 2020. We will possibly find something similar to Carlo's plot on the kicker heating rate
