- \*saturation at  $\Phi_{eq} > 5 \cdot 10^{14} \text{ cm}^{-2}$
- \*\*\*annealing not fully completed
- \*\*\*\* depends on thickness

## Neutron irradiated samples

MCz-p,n ; DOFZ-n ; STFZ-n type:

- $\beta_{eq} \sim g_c \sim 20 \cdot 10^{-3} \text{ cm}^{-1}$  [5,8,10]
- $g_Y = 4 \cdot 10^{-2} \text{ cm}^{-1}$
- $\tau_{ra} = \sim 80 \text{ min@80C}$

Epi-Si:

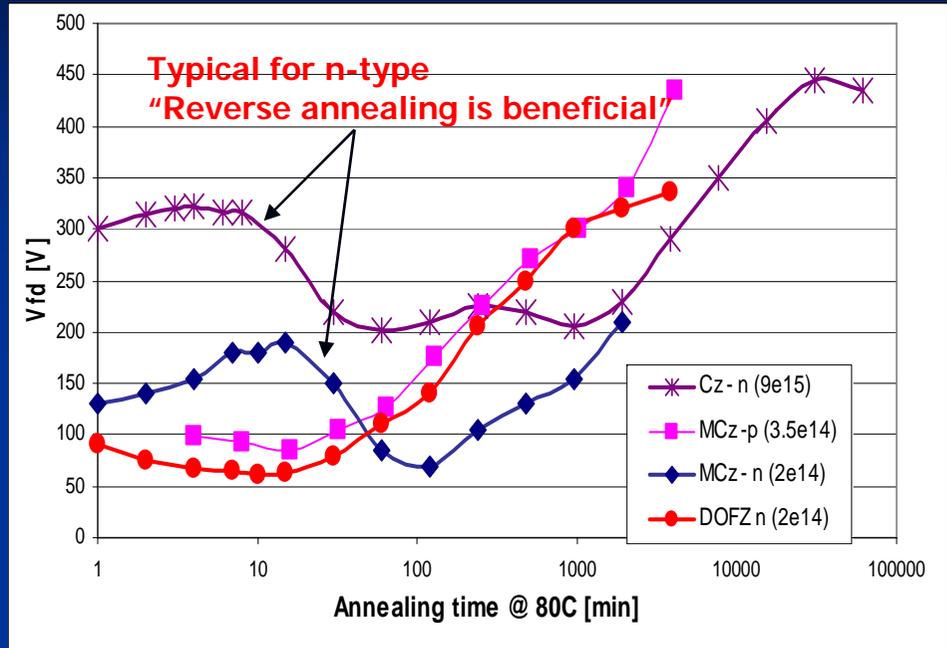

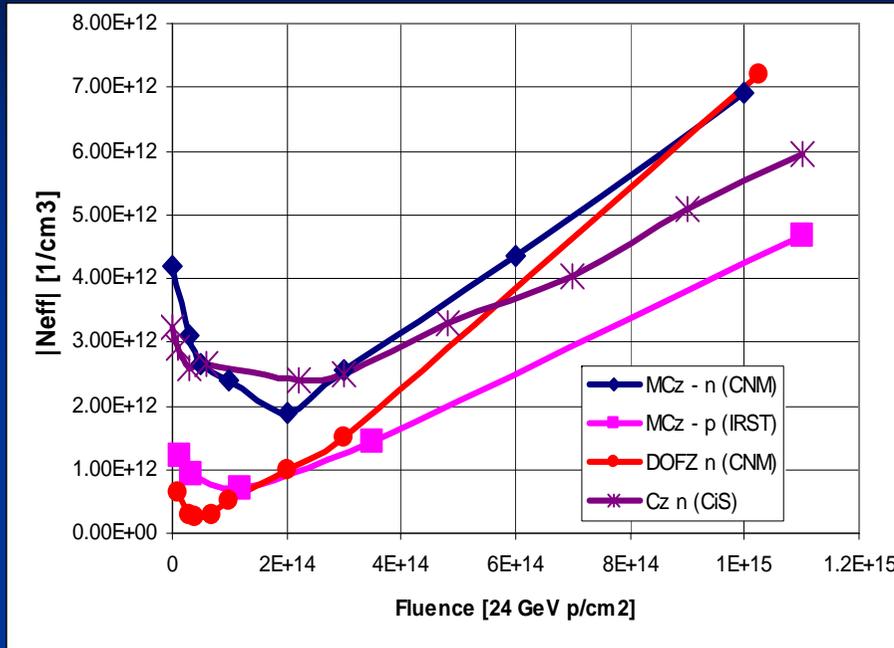

- $\rho > 150 \text{ } \Omega\text{cm}$  (75 and 150  $\mu\text{m}$  samples)
  - $g_c \sim 5 \cdot 10^{-3} \text{ cm}^{-1}$  [8,11]
- $\rho = 50 \text{ } \Omega\text{cm}$  (75 and 150  $\mu\text{m}$  samples)
  - $g_c \sim -5 \cdot 10^{-3} \text{ cm}^{-1}$  [8,11]

## 26 MeV proton irradiated samples

Type inversion is observed for all materials (SMART, HH)!  
How does that fit to our picture?

# 24 GeV proton irradiated samples

# Neutron irradiated samples

# *Probing of material type*

## ■ Probing material type

- TCT
- Annealing curve shape
- Neutrons introduce negative space charge, so adding them to
  - p-type material ->  $V_{fd}$  increases
  - n-type material ->  $V_{fd}$  decreases

We also need to do some mixed irradiations to check for any surprises and simulate SLHC detector!  
(are there any fully annealed MCz-p type that you can miss?)

# To do

- Mixed irradiations (list of samples)
- Isochronal annealing (60,80,100,120,140 °C...) measurement of trapping !
- Conversion list pad detector -> different segmented devices (shaping times of amplifiers)
- Bistability with  $^{90}\text{Sr}$
- C(V) Neff profile
- Irradiation under bias?
- H in Si (ongoing deuterium implantation)
- $\tau_r$  during 9 MeV p irr.!

# MCz p,n puzzle with 24 GeV p

- [C] [O]= $3.8 \times 10^{17} \text{ cm}^{-3}$  in MCz-Okmetic?
  - Sumitomo [O]= $1 \times 10^{18}$ ;
- Free carriers during irr.
- Other impurities in MCz-(p,n) Fe?
- Campaign with MCz n,p
- Epi-p evaluation and comparisson

# 26 MeV protons

- Question about irr. T (8 min @ 80C)

# Irradiations

6/13/2007
