Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

# Neutral meson mixing

A quantum mechanical phenomenon in which neutral mesons can oscillate between their particle and anti-particle state Their mass eigenstates, related to the flavour eigenstates, are:  $|D_{1,2}\rangle = p |D^0\rangle \pm q |\overline{D^0}\rangle$  with  $|p|^2 + |q|^2 = 1$ 

In the limit of CP symmetry, q = p and the oscillations characterised by two dimensionless parameters

$$x \equiv \frac{m_1 - m_2}{\Gamma} = \frac{2(m_1 - m_2)}{\Gamma_1 + \Gamma_2} \qquad \qquad y \equiv \frac{\Gamma_1 - \Gamma}{2\Gamma}$$

where  $m_{1,2}$  and  $\Gamma_{1,2}$  are the mass and decay width of the CP-even/odd eigenstate  $D_{1,2}$  and  $\Gamma$  is the average decay width

Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

- $\frac{\Gamma_2}{\Gamma_1} = \frac{\Gamma_1 \Gamma_2}{\Gamma_1 + \Gamma_2}$

Krakow - 11/01/24

3

The probabilities of an initially produced  $D^0$  evolving into a given state at the time t are:

$$P(D^{0} \to D^{0}, t) = \left| \left\langle D^{0} | D^{0}(t) \right\rangle \right|^{2} = \frac{e^{-\Gamma t}}{2} \left[ \cosh(\gamma \Gamma t) + \cos(\gamma \Gamma t) \right]$$
$$P(D^{0} \to \overline{D^{0}}, t) = \left| \left\langle \overline{D^{0}} | D^{0}(t) \right\rangle \right|^{2} = \left| \frac{q}{p} \right|^{2} \frac{e^{-\Gamma t}}{2} \left[ \cosh(\gamma \Gamma t) - \cos(\gamma \Gamma t) \right]$$

For 
$$\left|\frac{q}{p}\right| \neq 1$$
 the  $D^0 \to \overline{D^0}$  and the  $\overline{D^0} \to D^0$  process

This is CP violation in mixing

The values of x and y are of the order of 1 %

Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

# Pinmixing

ses do not have the same probability

Defined the decay amplitude of a  $D^0$  or  $D^0$  meson to a final state for f as  $A_{\bar{f}} = \langle \bar{f} | \mathcal{H} | D^0 \rangle$  $\bar{A}_{\bar{f}} = \langle \bar{f} | \mathcal{H} | \bar{D}^0 \rangle$  $A_f = \langle f | \mathcal{H} | D^0 \rangle$  $\bar{A}_f = < f | \mathcal{H} | \bar{D^0} >$ If  $|A_f| \neq |\overline{A}_f|$  CP violation can proceed through the decay

Experimentally, CP violation in the decay is measured by the asymmetry

$$A_{CP}(f) = \frac{\Gamma(D^0 \to f) - \Gamma(\bar{D^0} \to \bar{f})}{\Gamma(D^0 \to f) + \Gamma(\bar{D^0} \to \bar{f})} = \frac{|A_f|^2 - |A_f|^2}{|A_f|^2 + |A_f|^2}$$

### Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

# **P**in the decay

For charm decays, CP violation in the decay was observed by the LHCb collaboration in 2019 [<u>Phys. Rev. Lett. 122, 211803 (2019)</u>]:  $\Delta A_{CP} = A_{CP}(D^0 \to K^+ K^-) - A_{CP}(D^0 \to \pi^+ \pi^-)$  $\Delta A_{CP} = (-15.4 \pm 2.9) \times 10^{-4}$ corresponding to a  $\Delta A_{CP} \neq 0$  in 5.3 $\sigma$ 

## *CP* in the interference between mixing and decay

The  $D^0$  and the  $\overline{D^0}$  meson must share the final state  $(f = \overline{f})$ This occurs when the decay amplitude for the  $D^0 \rightarrow f$  process interferes with the decay amplitude for the  $D^0 \to \overline{D^0} \to f$  process and induces a CP violation

Mathematically it is expressed as:

$$\phi_{\lambda_f} = \arg\left(\frac{q}{p}\frac{\bar{A}_f}{A_f}\right) = \arg(\lambda_f) \neq 0$$

Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

# The parameter y<sub>CP</sub>

Because of  $D^0 - D^0$  mixing, the effective decay width I average width  $\Gamma$ 

$$y_{CP}^{f} = \frac{\hat{\Gamma}(D^{0} \to f) + \hat{\Gamma}(\bar{D^{0}} \to f)}{2\Gamma} - 1 \sim |y| \cos\phi_{\lambda_{f}}$$

- No CP violation if  $\phi_{\lambda_f} = 0 \implies y = y_{CP}$
- Any significant departure in the measurement of  $y_{CP}$  and in the interference between mixing and decay

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

Because of  $D^0 - \overline{D^0}$  mixing, the effective decay width  $\widehat{\Gamma}_{CP}$  of decays to CP-even final states differs from the

### • Any significant departure in the measurement of $y_{CP}$ from y would indicate the CP violation through mixing

- $y_{CP} y_{CP}^{K\pi} = (6.96 \pm 0.26 \pm 0.13) \times 10^{-3}$ • Four times more precise than the previous
  - world average

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

# Analysis strategy (I)

- Measurement of  $y_{CP}$  using  $D^0 \to K^+K^-$ ,  $D^0 \to \pi^+\pi^-$  and  $D^0 \to K^-\pi^+$  decays • The  $D^0$  mesons are required to originate from  $D^*(2010)^+ \rightarrow D^0 \pi^+$ • Reconstructed in a LHCb dataset in pp collisions at  $\sqrt{s} = 13$  TeV in the Run2 data taking period corresponding to an integrated luminosity of 6 fb<sup>-1</sup> p • The parameters  $y_{CP} - y_{CP}^{K\pi}$  are measured from the decay-time ratios  $R^{f}(t)$  of  $D^{0} \rightarrow f$

- over  $D^0 \to K^- \pi^+$  signal yields as a function of the reconstructed  $D^0$  decay time, t

$$R^{f}(t) = \frac{N(D^{0} \to f, t)}{N(D^{0} \to K^{-}\pi^{+}, t)} = e^{-\left(y_{CP}^{f} - y_{CP}^{K\pi}\right)\frac{t}{\tau_{D^{0}}}} \frac{\epsilon(f, t)}{\epsilon(K^{-}\pi^{+}, t)} \left(f = K^{+}K^{-}, \pi^{+}\pi^{-}\right)$$

with  $\tau_{D^0} = (410.1 \pm 1.5)$  fs and  $\epsilon(K^{\pm}\pi^{\pm}, t)$  is the time-dependent efficiency for the considered final state

Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

Krakow - 11/01/24

 $K^{+}, \pi^{+}$ 

# Analysis strategy (II)

- particles  $\Rightarrow$  distinct kinematic distributions of the final state particles of the  $D^0$  candidate in the LAB To obtain equal acceptance for both decays each  $D^0$  candidate selected in one final state would also pass the selection requirements for the other final state with the same  $D^0$  kinematic properties  $\Rightarrow$  a kinematic matching procedure
- The selection efficiencies of  $D^0 \to f$  and  $D^0 \to K^- \pi^+$  decays differ because of the different masses of their final-state 0

### Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

![](_page_11_Figure_7.jpeg)

![](_page_11_Picture_8.jpeg)

# Kinematic matching procedure

- candidate is performed, such that both final-state particle momenta have equal magnitude

$$|\vec{p}^*| = \frac{\sqrt{\left(m_{D^0}^2 - (m_{K^+} - m_{K^-})^2\right) \left(m_{D^0}^2 - (m_{K^+} + m_{K^-})^2\right)}}{2m_{D^0}}$$

- By substituting  $m_{K^+}$  with  $m_{\pi^+}$ , a  $D^0 \to K^- \pi^+$  state with identical kinematic properties is generated
- Then a kinematic weighting procedure is performed to treat the difference of detection efficiencies

• Event-by-event analytical transformation: matches the final-state kinematic variables of one decay to the other • To match the kinematics of a  $D^0 \to K^- K^+$  decay to a  $D^0 \to K^- \pi^+$  decay, a boost to the CoM frame of the  $D^0$ 

![](_page_12_Figure_10.jpeg)

• The use of the  $K^-\pi^+$  kinematics in the LAB ensures that both the  $D^0$  decays cover the same kinematic phase space

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

# Future perspective

- The goal for Runs 3 & 4, planned for 2022-2025 and 2029-2032 respectively, is to accumulate an additional  $50 \,\mathrm{fb^{-1}of}\,pp\,\mathrm{data}\,\mathrm{at}\,\sqrt{s} \approx 13.6\,\mathrm{TeV}$ o Run 3:
  - Removal of hardware trigger  $\Rightarrow$  no detection asymmetry and greater flexibility in design of the selections • Introduction of exclusive HLT1 lines to reduce time-momentum correlations and reduce related systematic
  - uncertainties
- These data should provide more precise measurements of  $D^0 D^0$  mixing and significantly greater sensitivity to direct and indirect CP violation in  $D^0$  decays

### Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

![](_page_19_Picture_6.jpeg)

![](_page_20_Picture_0.jpeg)

• The previous measurements use the average decay width of  $D^0 \to K^- \pi^+$  and  $D^0 \to K^+ \pi^-$  decays as a proxy to  $\Gamma$ • This does not give direct access to  $y_{CP}^{f}$  but corresponds to

$$\hat{\Gamma}(D^0 \to f) + \hat{\Gamma}(L)$$

$$\hat{\Gamma}(D^0 \to K^- \pi^+) + \hat{\Gamma}(L)$$

• 
$$y_{CP}^{K\pi} \approx -0.4 \times 10^{-3}$$

Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

 $\frac{f(D^0 \to f)}{f(\bar{D^0} \to K^+\pi^-)} - 1 \approx y_{CP}^f - y_{CP}^{K\pi}$ 

![](_page_20_Picture_8.jpeg)

![](_page_20_Picture_9.jpeg)

# Kinematic weighting procedure

- which is performed after the kinematic matching
- state particles of one of the decays to the distributions of the other decay
- The procedure is performed using a gradient-boosted-reweighting algorithm from the hep\_ml library

![](_page_21_Figure_4.jpeg)

### Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

• The correction of the difference of detection efficiencies is treated with the kinematic weighting procedure,

• The procedure consists of weighting the p,  $p_T$  and  $\eta$  distributions of the  $D^{*+}$  meson and both matched final-

![](_page_21_Picture_10.jpeg)

![](_page_21_Picture_11.jpeg)

![](_page_22_Picture_0.jpeg)

### The Johnson $S_{II}$ distribution is defined as:

 $S_U(x \mid \mu, \sigma, \delta, \gamma) = \frac{\delta}{\sigma \sqrt{2\pi}} \frac{1}{\sqrt{1 + (1 + 1)^2}}$ 

### where $\delta$ and $\gamma$ are tail parameters

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

## Johnson S<sub>1</sub>-distribution

$$\frac{1}{\left(\frac{x-\mu}{\sigma}\right)^2}e^{-\frac{1}{2}\left(\gamma+\delta \sinh^{-1}\left(\frac{x-\mu}{\sigma}\right)\right)^2}$$

![](_page_22_Picture_9.jpeg)

# **Empirical function**

### The combinatorial background is fitted with the empirical model :

$$P_{BKG}(\Delta m \mid m_0, \alpha) = \frac{1}{I_B} \Delta m \sqrt{\frac{\Delta m^2}{m_0^2} - 1} \cdot e^{-\alpha \left(\frac{\Delta m^2}{m_0^2} - 1\right)}$$

### where $m_0$ and $\alpha$ are free parameters and $I_B$ is a normalisation constant

Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

![](_page_23_Picture_9.jpeg)

# Time-dependent efficiency

- It can be written as the product of two distinct components • The selection efficiency is related to requirements applied at various stages of the LHCb data acquisition system
  - The detection efficiency arises from the interaction of the charged kaons and pions with the LHCb detector
- The time dependence of the efficiencies of the numerator and denominator decays differs because of their different final states, and could bias the measurement if not accounted for
- The analysis strategy consists of equalising the selection efficiencies and then the detection efficiencies of the numerator and denominator decays
- corrections
- Both steps are performed using data-driven methods

• Their combined effects cancel out in the decay time ratio, such that  $y_{CP}^f - y_{CP}^{K\pi}$  can be measured without additional

# Validation procedure through cross-check

ratio of the yields of  $D^0 \rightarrow h^- h^+$  decays

 $R^{CC}(t) = \frac{N(D^0 \to \pi^+ \pi)}{N(D^0 \to K^- K)}$ 

where the parameter  $y_{CP}^{CC}$  is expected to be compatible with zero, since the final-state dependent part of  $y_{CP}$  is negligible

- biasing effects from their corresponding efficiencies
- The data samples are contaminated by the presence of three noticeable background contributions: 0 where  $m(h^-h^+\pi^+)$  is the mass of the  $D^{*+}$  candidate and  $m(h^-h^+)$  that of the  $D^0$  candidate

### Alessia Anelli

• The procedure is validated with LHCb data through a study of a cross-check observable,  $R^{CC}(t)$ , built from the time-dependent

$$\frac{\pi^-, t)}{K^+, t)} \propto e^{-y_{CP}^{CC} \frac{t}{\tau_{D^0}}} \frac{\epsilon(\pi^+ \pi^-, t)}{\epsilon(K^- K^+, t)}$$

•  $R^{CC}(t)$  benefits from the fact that both final state tracks are different for numerator and denominator decays, increasing the

the combinatorial background, which is subtracted by means of a fit to the distribution of  $\Delta m = m(h^-h^+\pi^+) - m(h^-h^+)$ 

• the second background contribution comes from  $D^{*+}$  mesons that are not produced at the PV but from the decay of B mesons: the effect of such secondary decays on the measurement is accounted by including their presence in the fit model • a third background contribution is related to the presence of partially reconstructed or misreconstructed  $D^{*+} \rightarrow D^0 \pi^+$  decays

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

![](_page_25_Figure_18.jpeg)

![](_page_25_Figure_19.jpeg)

![](_page_25_Picture_20.jpeg)

# Validation procedure with RAPIDSIM

- without  $D^0 D^0$  mixing
- profiles of  $D^0 \to K^- K^+$  and  $D^0 \to K^- \pi^+$  decays at low  $\tau_{D^0}$
- $D^0 \rightarrow K^- \pi^+$  decays
- A fit to the decay time ratio  $R^{KK}(t)$  gives  $y_{CP}^{KK} y_{CP}^{K\pi} = (0.17 \pm 0.19) \times 10^{-3}$ , compatible with the expected value of zero

• Signal candidates of prompt  $D^{*+} \to (D^0 \to K^- K^+)\pi^+$  and  $D^{*+} \to (D^0 \to K^- \pi^+)\pi^+$  decays are generated

• Selection criteria representative of the trigger  $\Rightarrow$  requirements on momentum and IP-related quantities, which are strongly correlated with the  $D^0$  decay time and induce substantial differences between the selection efficiency

• The kinematic matching procedure is then applied to equalise the selection efficiencies of  $D^0 \rightarrow K^- K^+$  and

• The kinematic matching procedure corrects effectively for the kinematic differences between the two decays

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

![](_page_26_Figure_15.jpeg)

![](_page_26_Picture_16.jpeg)

# Validation procedure with full simulation

- particles of the decay chain without the full underlying event
- Following the application of the kinematic matching and weighting procedures, the parameters are

$$y_{CP}^{CC} =$$

$$y_{CP}^{\pi\pi} - y_{CP}^{K\pi} =$$

$$y_{CP}^{KK} - y_{CP}^{K\pi} =$$

- This result validates the analysis procedure with simulation

### Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

• Large signal yields of  $D^0 \to K^- \pi^+$ ,  $D^0 \to K^- K^+$  and  $D^0 \to \pi^- \pi^+$  decays are obtained by generating the

• The analysis procedure is applied to all three decay channels independently for each year and magnet polarity to account for potential differences between the data taking conditions, and the results are combined as a final step

 $(0.15 \pm 0.36) \times 10^{-3}$ 

 $(0.17 \pm 0.43) \times 10^{-3}$ ,

 $(0.10 \pm 0.24) \times 10^{-3}$ 

• All three results are compatible with zero  $\Rightarrow$  expected since  $D^0 - \overline{D^0}$  mixing has not been simulated

![](_page_27_Figure_16.jpeg)

![](_page_27_Picture_17.jpeg)

## Secondaries contamination (I)

- the PV but from *B* meson decays
- $f_{sec}(t)$  is the time-dependent ratio of the number of  $D^0$  mesons from secondary decays over the total • To account for the residual contamination of secondary  $D^{*+}$  candidates, the ratio  $R^{f}(t)$  is separated according to its prompt and secondary components,  $R_{prompt}^{f}(t)$  and  $R_{sec}^{f}(t)$ , as

$$R^{f}(t) \approx \left(1 - f_{sec}(t)\right) R^{f}_{prompt(t)} + f_{sec}(t) R^{f}_{sec(t)}$$

Alessia Anelli

Measurement of the charm-mixing and CP violation parameter y<sub>CP</sub>

• The data samples are also contaminated by the presence of secondary  $D^{*+}$  mesons, which are not produced at

![](_page_28_Figure_8.jpeg)

![](_page_28_Figure_10.jpeg)

![](_page_28_Picture_11.jpeg)

![](_page_28_Picture_12.jpeg)

## Secondaries contamination (II)

• The decay time ratio of  $D^0$  mesons from secondary  $D^{*+}$  decays is expressed as

$$R_{sec}^{f}(t) \propto e^{-(y_{CP}^{f}-y_{CP}^{K\pi})\frac{\langle t_{D}(t)\rangle}{\tau_{D^{0}}}}$$

where  $\langle t_D(t) \rangle$  is the average true  $D^0$  decay time  $\langle t_D \rangle$  as a function of the reconstructed  $D^0$  decay time t

- $f_{sec}(t)$  is obtained by fitting the distribution of IP( $D^0$ ) in data in each interval of t using simulation-based templates of  $IP(D^0)$  from prompt and secondary decays
- $\langle t_D(t) \rangle$  is determined from the simulated sample of secondary decays

![](_page_29_Figure_12.jpeg)
