HL-LHC upgrade

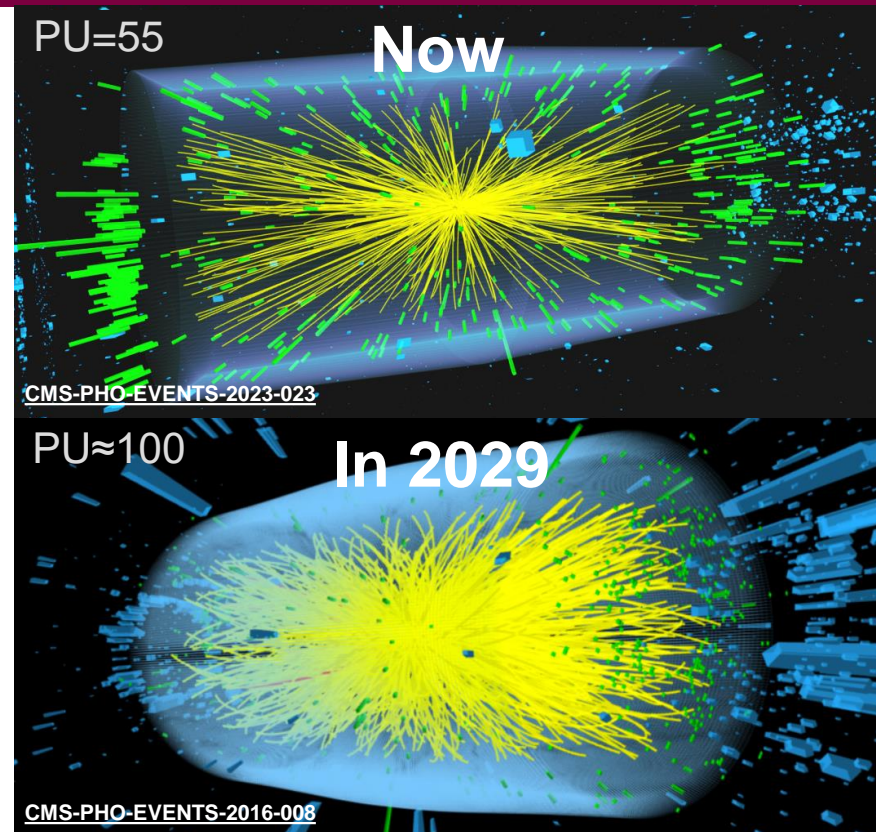

- The High Luminosity LHC is expected to launch at 2029
- Great discovery potential improvement:
 - Proton-proton collision energy: 14 TeV
 - Peak instantaneous luminosity:
LHC **nominal** $1 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$ \rightarrow LHC **current** $\sim 2.1 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$ \rightarrow **HL-LHC** $7.5 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$
 - Integrated luminosity: LHC **nominal** $\sim 300 \text{ fb}^{-1}$ \rightarrow **HL-LHC** $\sim 3000 \text{ fb}^{-1}$ over 10 years
 - Average pile-up: LHC **nominal** **25** \rightarrow LHC **current** ~ 60 \rightarrow **HL-LHC** **200**

Last updated: January 2022

Detector requirements for HL-LHC

- More collisions will also bring challenges:
 - $\sim 3\times$ more tracks than currently
 - higher trigger rates
 - higher data rates
 - harder to separate tracks
 - bigger radiation doses (up to 1.2 Grad)
- Requirements for the Phase-2 CMS tracker:
 - High granularity
 - High radiation tolerance
 - Contribution to level-1 trigger
 - Extended acceptance range
 - Reduced material budget
- This makes the current CMS tracker not suitable for operation after the HL-LHC upgrade
 - A completely new tracker is in preparation

Current CMS tracker

CMS DETECTOR

Total weight : 14,000 tonnes
Overall diameter : 15.0 m
Overall length : 28.7 m
Magnetic field : 3.8 T

STEEL RETURN YOKE
12,500 tonnes

SILICON TRACKERS
Pixel ($100 \times 150 \mu\text{m}^2$) $\sim 1.9 \text{ m}^2 \sim 124\text{M}$ channels
Microstrips ($80\text{--}180 \mu\text{m}$) $\sim 200 \text{ m}^2 \sim 9.6\text{M}$ channels

SUPERCONDUCTING SOLENOID
Niobium titanium coil carrying $\sim 18,000 \text{ A}$

MUON CHAMBERS
Barrel: 250 Drift Tube, 480 Resistive Plate Chambers
Endcaps: 540 Cathode Strip, 576 Resistive Plate Chambers

PRESHOWER
Silicon strips $\sim 16 \text{ m}^2 \sim 137,000$ channels

FORWARD CALORIMETER
Steel + Quartz fibres $\sim 2,000$ Channels

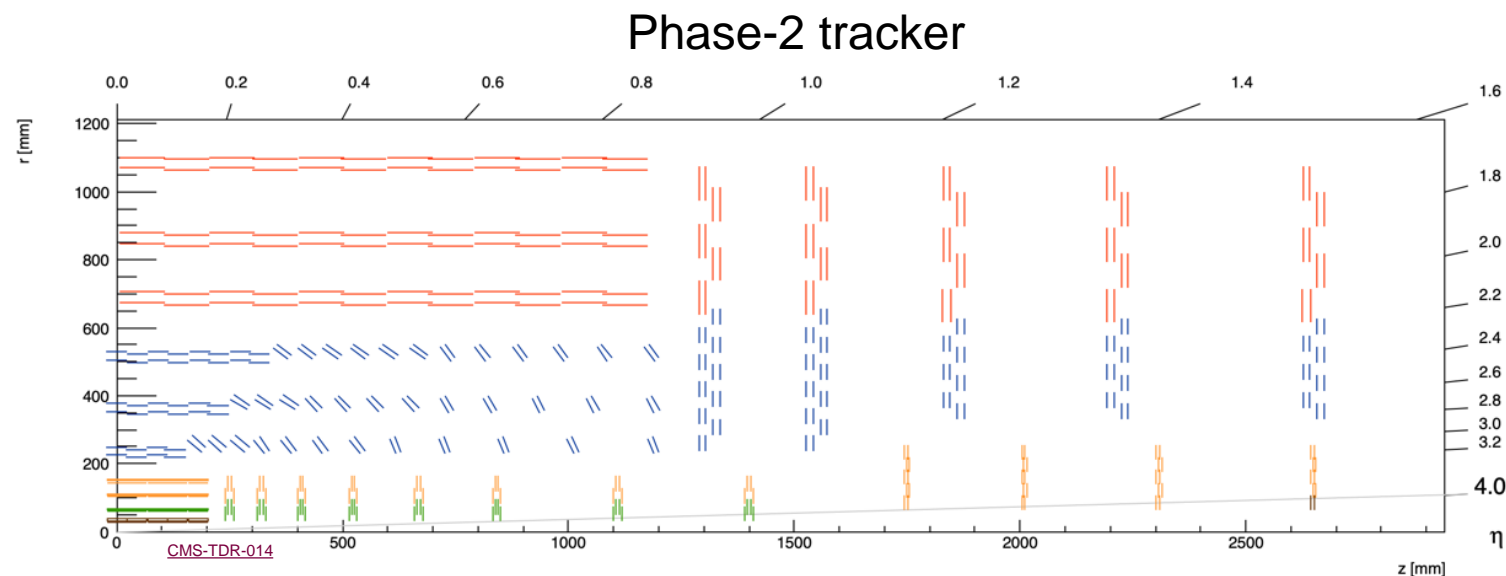

CRYSTAL ELECTROMAGNETIC CALORIMETER (ECAL)
 $\sim 76,000$ scintillating PbWO_4 crystals

HADRON CALORIMETER (HCAL)
Brass + Plastic scintillator $\sim 7,000$ channels
[J. Phys.: Conf. Ser. 513 022032](#)

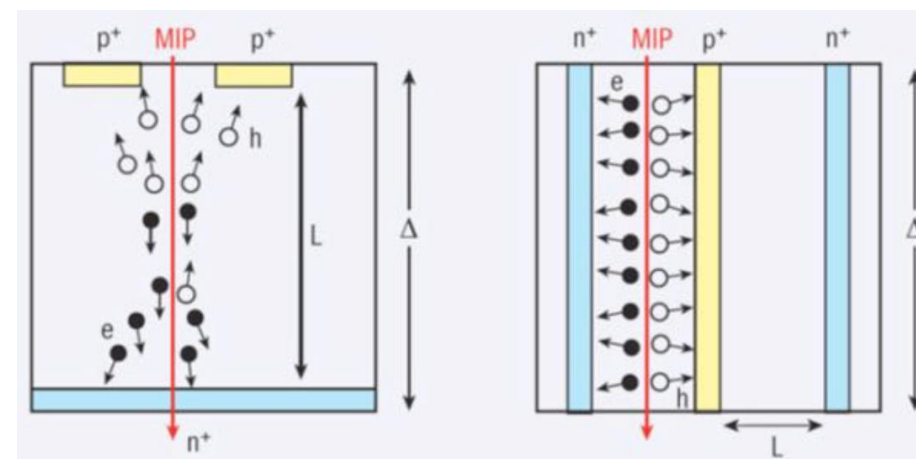

Phase-2 CMS tracker upgrade

- Both CMS Inner and Outer Tracker systems will be completely replaced
- **Phase-2 Outer Tracker:**
 - 6 barrel layers and 5 endcap disks per side
 - Micro-strip and macro-pixel silicon sensors
 - Contribution to the L1 trigger
- **Phase-2 Inner Tracker:**
 - 4 barrel layers and 12 endcap/forward disks (instead of the current 3 disks)
 - $25 \times 100 \mu\text{m}^2$ silicon pixel sensors with both 3D and planar technologies
 - Tracking acceptance: up to $|\eta| = 4.0$ (instead of the current $|\eta| < 3.0$)

Phase-2 Inner Tracker

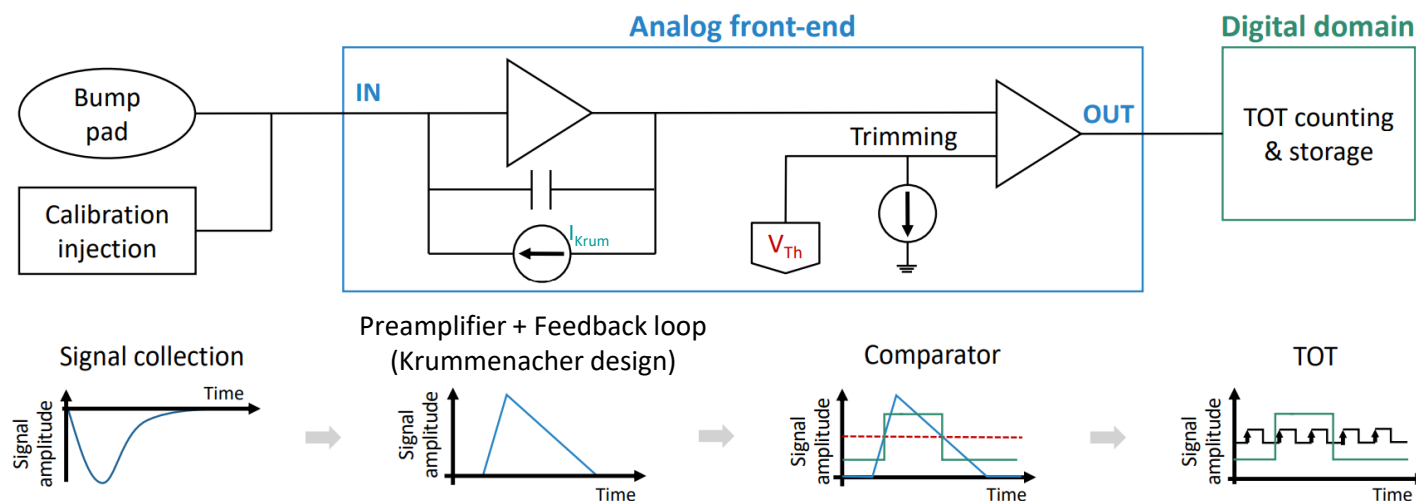

- 6× smaller pixels compared with the current tracker
 - 25×100 μm²
 - 150 μm active thickness
- Total active surface area ~4.9 m²
- Total pixel count ~2 billion
- Two different pixel technologies
 - 3D pixel sensors on barrel layer 1
 - n-in-p planar sensors everywhere else
- A readout chip based on 64 nm CMOS technology is developed by RD53 collaboration
 - RD53 is developing chips for both CMS and ATLAS with different features

<https://cerncourier.com/a/silicon-sensors-go-3d/>

The CMS ReadOut Chip

- Features of the chip under development:
 - Able to withstand the radiation up to 1 Grad
 - Low power consumption of $< 1 \text{ W/cm}^2$
 - Compatible with serial powering by using on-chip shunt-LDO regulators
- Pre-production prototypes (RD53B) are undergoing many different tests
- The RD53B version for CMS is called CMS ReadOut Chip – CROC_v1
 - 432×336 channels
 - Bump-bonded to the sensor
 - Wire-bonded to the readout
 - Linear analog front-end architecture
 - 4-bit digital readout for signal strength (ToT)
 - Single- or double-slope operation possible

arXiv:2105.00070

Test setup

Our test setup for CROC chips consists of:

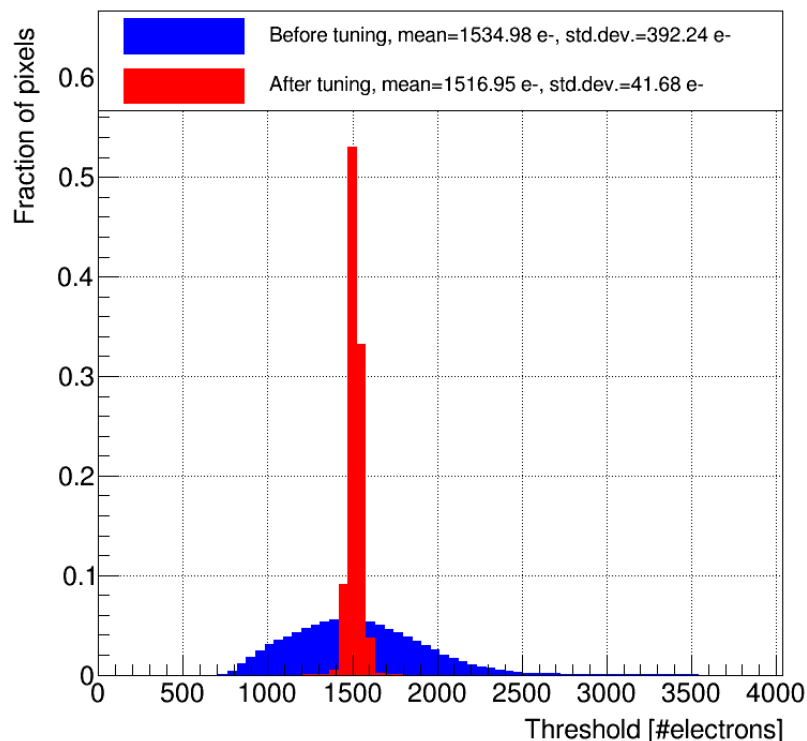

- Custom-made equipment:
 - CROC chip with sensor mounted on a Single Chip Card (SCC)
 - Electrical readout FMC board connected to SCC via DP connection
 - FC7 board with FPGA and 2 FMC connectors
- Standard equipment:
 - DIO5 FMC board (provides external trigger, clock, etc.)
 - Low and high voltage supply
 - Computer connected to the FC7 via IPbus
 - IPbus is a protocol used to communicate between software and firmware via ethernet (<https://ipbus.web.cern.ch/>)
 - Computer runs the Ph2-ACF software which is designed to perform both Inner and Outer Tracker hardware tests

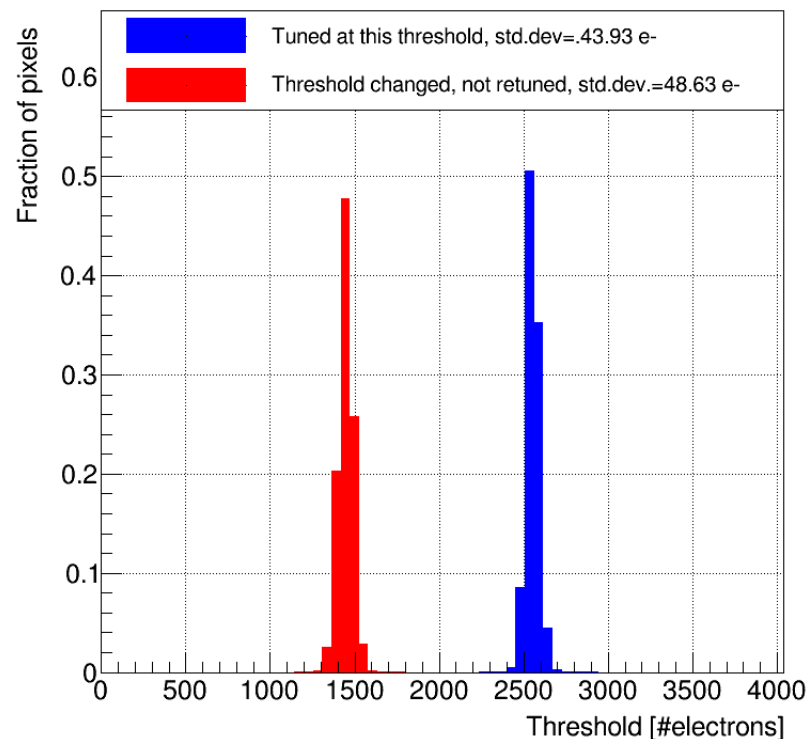

Hit detection threshold tuning

- A hit is registered once the voltage from the preamplifier surpasses the voltage threshold
- Threshold can be tuned globally but varies from pixel-to-pixel due to transistor mismatch
- Each pixel has a dedicated trimming DAC (TDAC, 5 bits) to reduce the threshold variation between pixels
 - The trimming DAC strength is controlled by a global DAC (called LDAC_LIN)
- The threshold CROC chip can be successfully tuned with a threshold spread of only $\sim 50 e^-$ between the pixels
 - This is 2 \times better than the RD53A demonstrator chip
- The threshold spread stays stable after global threshold shift
 - Relevant for real experiment conditions
- This was confirmed with multiple chips

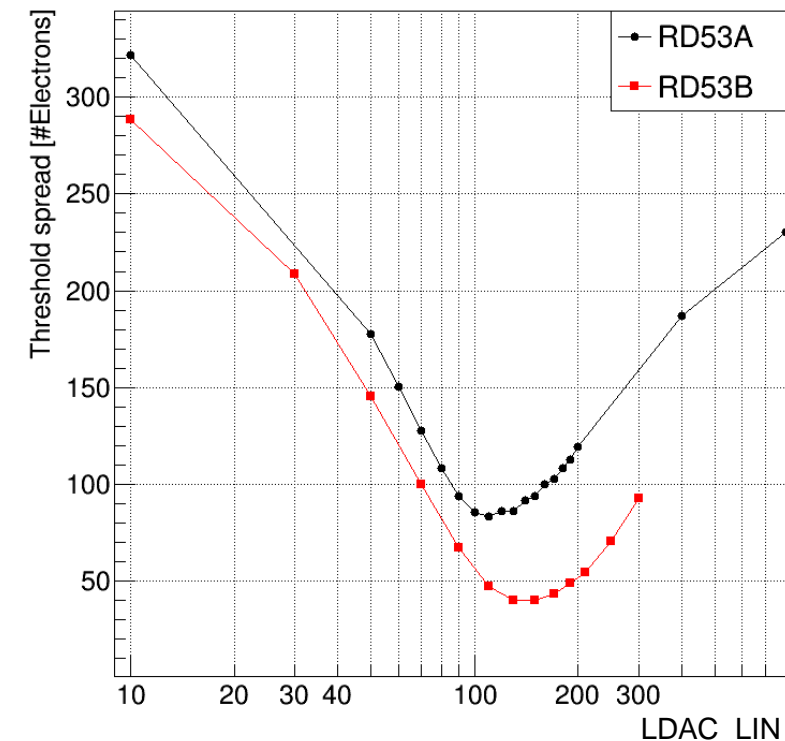

Threshold distribution before and after tuning

Threshold distribution before and after global shift

Threshold spread vs. LDAC_LIN

ToT gain tuning

- The signal strength is measured by the time the preamplifier output voltage stays above the comparator threshold
 - Time Over Threshold (ToT) is measured in 25 ns intervals
 - 4 bits, single or dual slope modes available
- Preamplifier feedback (“Krummenacher”) current can be tuned to obtain different ToT gain curves
 - Enables choosing a sweetspot for signal resolution and dynamic range
- ToT gain slope has non-linearities for signal values close to the threshold and becomes linear at higher signal strength
- ToT gain slope does not depend on the threshold itself, as expected with the linear analog front-end

Single slope

Average ToT vs. injected charge

Average ToT vs. injected charge

Dual slope (6-to-4 bit compression)

Average ToT vs. injected charge

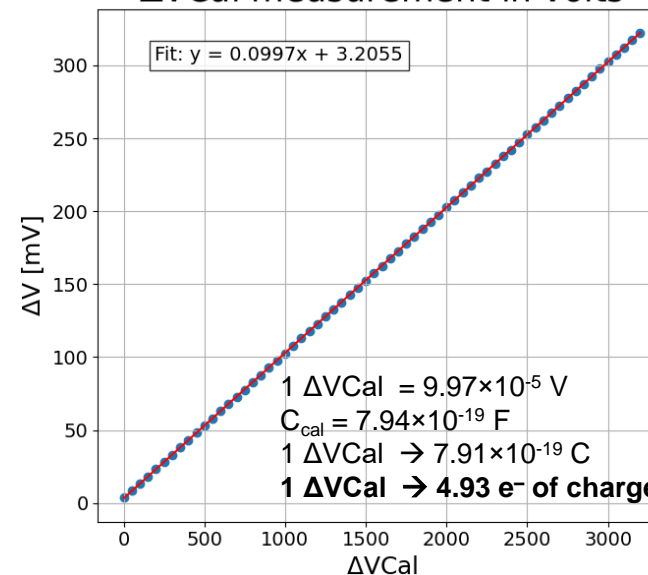

Average ToT vs. injected charge

Hit detection threshold unit calibration

- Threshold is measured using a calibration circuit
- Calibration pulse strength is controlled by DAC units (ΔV_{Cal})
- We have used the internal voltage multiplexer to measure the physical ΔV_{Cal} value
- The resultant ΔV_{Cal} value corresponds $\sim 5 e^-$ of signal, confirmed with multiple chips
- The threshold unit value of $\sim 5 e^-$ was also confirmed by using ^{241}Am x-ray source
 - X-rays are monochromatic (59.54 keV) and always release the same amount of signal in the sensor (16268 e^-)

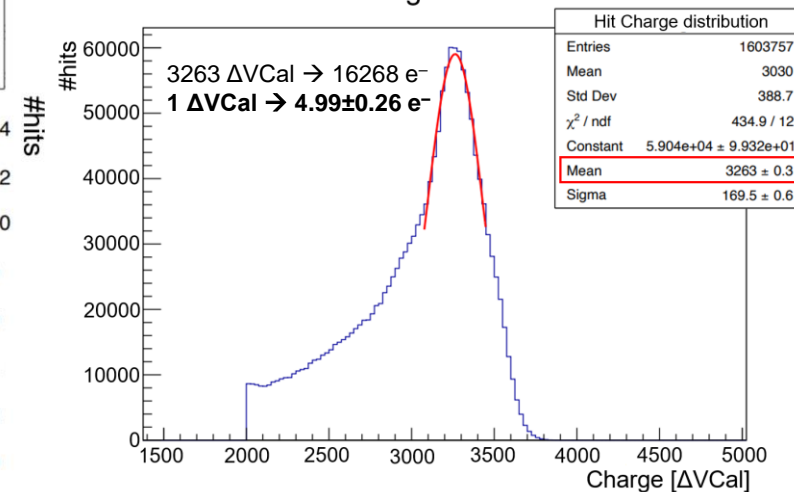

ΔV_{Cal} measurement in volts

Hit Count Map

Hit Charge distribution

- The HL-LHC upgrade comes in 2029 and brings a big challenge for detector builders but provides big physics opportunities
- The Phase-2 detectors must have higher resolution, higher data output rates, and higher radiation tolerance than the current ones
- A completely new tracker is in preparation prepared for CMS
- Pixel detector chips for the Inner Tracker are developed by the CERN/RD53 collaboration
- Pre-production chips CROC_v1, are still tested extensively and show good performance

Thank you!

Particle fluence in 1 MeV neutron equivalent

Integrated particle fluence in 1MeV neutron equivalent per cm², for the Phase-2 tracker. The estimates shown correspond to a total integrated luminosity of 3000 fb⁻¹ of pp collisions at 14 TeV.

Outer Tracker contribution to L1 trigger

Figure 2.5: Illustration of the p_T module concept. (a) Correlation of signals in closely-spaced sensors enables rejection of low- p_T particles; the channels shown in green represent the selection window to define an accepted stub. (b) The same transverse momentum corresponds to a larger distance between the two signals at large radii for a given sensor spacing. (c) For the end-cap discs, a larger spacing between the sensors is needed to achieve the same discriminating power as in the barrel at the same radius.
