

# Operational beams

---

## →SFTPRO:

- Working now with 100/50/60 sharing
- High transmission and low losses at extraction
- PS colleagues worked on improving emittance share between islands and core (triggered by observations from NA62) → better now? Unfortunately, we cannot measure this in the SPS
- Main issue so far on H4 R22-11 and R22-12 bends – it seems solved now
- Today at 15h00 test of EBC in operation (about 2h for setting up and then running normally) – there was a significant work on RF and ABT to make this possible

## →HiRadMat:

- Very good progress on the experiment: almost fully completed – today access and tomorrow last few shots

## →LHC:

- Attempt to increase intensity today
- Agreed to have half a day to take the high intensity LHC cycle for 4-5h during the day today as HiRadMat won't take beam
