Introduction

Baryon Asymmetry of the Universe (BAU)

- Why do we exist???
- Baryon asymmetry is the **excess of matter over anti-matter** observed in the universe.

$$\eta_B = \frac{n_B - n_{\bar{B}}}{n_\gamma} = (6.04 \pm 0.08) \times 10^{-10} \quad (1)$$

This Number demands Physics Beyond Standard Model (BSM)

Baryogenesis

Baryogenesis

Sakharov conditions for Baryogenesis

- 1 Baryon number (B) violation
- 2 C and CP violation

Baryogenesis

[A. D. Sakharov, JETP Lett. 5, 24 (1967).]

Sakharov conditions for Baryogenesis

- 1 Baryon number (B) violation
- 2 C and CP violation
- 3 Departure from thermal equilibrium

Models of Baryogenesis

- **Baryogenesis** at the **Electroweak Phase Transition**.
(Kuzmin, Rubakov, Shaposhnikov, **PLB155 (1955)**)
- **GUT Baryogenesis** through the decay of heavy particles.
(Yashimura, **PRL41 (1978)**)
- **Baryogenesis** via **Leptogenesis**
(Fukugita, Yanagida, **PLB 174 (1986)**)

Baryogenesis via Leptogenesis

- Realized in the seesaw framework where heavy RH neutrinos are present
- Lepton asymmetry is generated by the decay of RH neutrinos.

$$\begin{aligned}
 N_i &\longrightarrow l\bar{\phi} \\
 N_i &\longrightarrow \bar{l}\phi \\
 \epsilon &= \frac{\Gamma - \bar{\Gamma}}{\Gamma + \bar{\Gamma}}
 \end{aligned}
 \tag{2}$$

- Complex Yukawa Matrix is the source of natural CP violation.
- Lepton asymmetry is converted to violation Baryon asymmetry.

Inverse seesaw ISS(2,3) framework

Inverse seesaw ISS(2,3) framework

- The Standard Model is extended by the sequential addition of 2 RH neutrinos and 3 SM singlet fermions s_i

$$L = -\frac{1}{2} n_L^T C m n_L + h.c \quad (3)$$

The mass matrix in the basis $n_L = (\nu_L, N_R, s)$

$$m = \begin{pmatrix} 0 & M_d^T & 0 \\ M_d & 0 & M_N \\ 0 & M_N^T & \mu \end{pmatrix} \quad (4)$$

$$\|\mu\| \leq \|M_d\|, \|M\|$$

[Abada, A. and Lucente M., Looking for the minimal inverse seesaw realisation, Nucl. Phys. B 885 (2014) 651]

Contd..

ISS realisation is characterized by the following mass spectrum

- Three **light active states** with masses in sub-eV range.
- $\# N_R$ pairs of **quasi-Dirac particles**.
- $\# s - \# \nu_R$ **light sterile states** (present only if $\#s > \# N_R$) with masses $\mathcal{O}(\mu)$
- The matrix can be block diagonalized to light and heavy sector as

$$M_\nu \approx M_d^T (M_N^T)^{-1} \mu M_N^{-1} M_d \quad (5)$$

$$M_H = \begin{pmatrix} 0 & M_N \\ M_N^T & \mu \end{pmatrix}$$

[Abada, A. et al, Dark Matter in the minimal Inverse Seesaw mechanism. JCAP, 2014(10):001, 2014]

Texture zeros in ISS(2,3)

Texture zeros in ISS(2,3)

Three matrices M_d, M_N and $\mu!!$

The twelve 2 – 0 textures of M_d in the framework of ISS (2, 3) are shown below:

2-0 textures of M_d		
$M_d^{(1)} = \begin{pmatrix} 0 & c & e \\ b & 0 & h \end{pmatrix}$	$M_d^{(2)} = \begin{pmatrix} a & 0 & e \\ 0 & d & h \end{pmatrix}$	$M_d^{(3)} = \begin{pmatrix} a & c & 0 \\ b & 0 & h \end{pmatrix}$
$M_d^{(4)} = \begin{pmatrix} a & 0 & e \\ b & d & 0 \end{pmatrix}$	$M_d^{(5)} = \begin{pmatrix} 0 & c & e \\ b & d & 0 \end{pmatrix}$	$M_d^{(6)} = \begin{pmatrix} a & c & 0 \\ 0 & d & h \end{pmatrix}$
$M_d^{(7)} = \begin{pmatrix} 0 & 0 & e \\ b & d & h \end{pmatrix}$	$M_d^{(8)} = \begin{pmatrix} a & c & e \\ 0 & 0 & h \end{pmatrix}$	$M_d^{(9)} = \begin{pmatrix} 0 & c & 0 \\ b & d & h \end{pmatrix}$
$M_d^{(10)} = \begin{pmatrix} a & c & e \\ 0 & d & 0 \end{pmatrix}$	$M_d^{(11)} = \begin{pmatrix} a & c & e \\ b & 0 & 0 \end{pmatrix}$	$M_d^{(12)} = \begin{pmatrix} a & 0 & 0 \\ b & d & h \end{pmatrix}$

Table: Possible two zero textures of M_d in ISS(2,3)

[Gautam, N. and Das, M.K., Impact of texture zeros on dark matter and neutrinoless double beta decay in inverse seesaw, NPB 971(2021)115519]

Texture zeros in ISS(2,3)

The two zero textures of the Dirac mass matrix M_D can be further classified to

$$A1 = \begin{pmatrix} 0 & c & e \\ b & 0 & h \end{pmatrix}; A2 = \begin{pmatrix} a & 0 & e \\ b & d & 0 \end{pmatrix}; A3 = \begin{pmatrix} a & c & 0 \\ 0 & d & h \end{pmatrix} \quad (6)$$

$$B1 = \begin{pmatrix} a & c & e \\ 0 & 0 & h \end{pmatrix}; B2 = \begin{pmatrix} a & c & e \\ 0 & d & 0 \end{pmatrix}; B3 = \begin{pmatrix} a & c & e \\ b & 0 & 0 \end{pmatrix} \quad (7)$$

The textures A1, A2, and A3 lead to one zero texture of the neutrino mass matrix. The structures of M_N and μ are

$$M_N = \begin{pmatrix} f & 0 & 0 \\ 0 & g & 0 \end{pmatrix}, \mu = \begin{pmatrix} p & 0 & 0 \\ 0 & p & 0 \\ 0 & 0 & p \end{pmatrix} \quad (8)$$

Leptogenesis in ISS (2,3) framework

Governing equations for BAU calculation

- The BAU can be expressed as,

$$Y_B = c \sum_i \kappa_i \epsilon_i \quad (9)$$

where the value of c is 10^{-2}

The CP asymmetry generated by the decay of N_i into any lepton flavor can be obtained as,

$$\epsilon_i = \frac{1}{8\pi} \sum_{j \neq i} \frac{\text{Im}[(hh^\dagger)_{ij}]}{\sum_\beta |h_{i\beta}|^2} f_{ij}^\nu \quad (10)$$

where, $h_{i\alpha}$ represents effective Yukawa coupling in the diagonal mass basis. f^ν is given as,

$$f_{ij}^\nu = \frac{(M_j^2 - M_i^2) M_i \Gamma_j}{(M_j^2 - M_i^2)^2 + M_j^2 \Gamma_j^2} \quad (11)$$

- Γ_i represents decay width of the heavy-neutrino N_i .

$$\Gamma_i = \frac{M_i}{8\pi} (hh^\dagger)_{ii} \quad (12)$$

Contd...

The expressions for κ depending on the scale of the wash out factor K .

$$-\kappa \approx \sqrt{0.1K} \exp[-4/(3(0.1K)^{0.25})], \quad \text{for } K \geq 10^6 \quad (13)$$

$$\approx \frac{0.3}{K(\ln K)^{0.6}}, \quad \text{for } 10 \leq K \leq 10^6 \quad (14)$$

$$\approx \frac{1}{2\sqrt{K^2 + 9}}, \quad \text{for } 0 \leq K \leq 10. \quad (15)$$

where, the wash out factor K is,

$$K_i = \frac{\Gamma_i}{H(z=1)} = \frac{M_i}{8\pi} (hh^\dagger)_{ii} \times \frac{M_{Pl}}{1.66\sqrt{g_*}M_i^2}$$

$H = 1.66\sqrt{g_*} \frac{M_i^2}{M_{pl}}$ with g_* approximately 110.

[Steve Blanchet, P. S. Bhupal Dev and R. N. Mohapatra, Leptogenesis with TeV Scale Inverse Seesaw in SO(10), Phys. Rev. D82, 115025 (2010).]

BAU in Inverse Seesaw Model

In the (N_i, s_i) flavor basis, we have the 2×2 matrices a

$$\tilde{M}_i = \begin{pmatrix} 0 & M_{N_i} \\ M_{N_i} & \mu_{ii} \end{pmatrix} = \begin{pmatrix} 0 & M_{N_i} \\ M_{N_i} & \varepsilon_i M_{N_i} e^{i\theta_i} \end{pmatrix} \quad (16)$$

The M_i is diagonalized with real and positive eigenvalues by a unitary transformation $U_i^T M_i U_i$ where

$$U_i = \begin{pmatrix} -i \cos \alpha_i e^{i\theta_i/2} & \sin \alpha_i e^{i\theta_i/2} \\ i \sin \alpha_i e^{-i\theta_i/2} & \cos \alpha_i e^{-i\theta_i/2} \end{pmatrix}$$

and the mixing angles are given by

$$\cos \alpha_i \simeq \frac{1}{\sqrt{2}} \left(1 + \frac{\varepsilon_i}{4}\right), \quad \sin \alpha_i \simeq \frac{1}{\sqrt{2}} \left(1 - \frac{\varepsilon_i}{4}\right) \quad (17)$$

The corresponding mass eigenvalues are given by

$$M_i \simeq M_{N_i} \left(1 \pm \frac{\varepsilon_i}{2}\right), \quad (i = 1, 2; j = 1, 2, 3, 4) \quad (18)$$

BAU in Inverse Seesaw Model

The expressions for CP asymmetry for the decay of one of the quasi-Dirac particles (say $i=1$) in terms of the Yukawa couplings in flavor basis,

$$\epsilon_1 = \frac{1}{8\pi} \sum_{j \neq 1} \frac{\text{Im}[(hh^\dagger)_{1j}]}{\sum_\beta |h_{1\beta}|^2} f_{1j}^\nu = \frac{\epsilon_2}{16\pi \sum_\beta |y_{1\beta}|^2} \text{Im}[e^{i(\theta_1 - \theta_2)} \sum_\alpha y_{1\alpha}^* y_{2\alpha}] f_{13}^\nu \quad (19)$$

$$\epsilon_2 = \frac{1}{8\pi} \sum_{j \neq 2} \frac{\text{Im}[(hh^\dagger)_{2j}^2]}{\sum_\beta |h_{1\beta}|^2} f_{2j}^\nu \simeq \frac{\epsilon_2}{16\pi \sum |y_{1\beta}|^2} \text{Im}[ie^{i(\theta_1 - \theta_2)} (\sum y_{1\alpha}^* y_{2\alpha})^2] f_{23}^\nu \quad (20)$$

Here, $\epsilon_i = \frac{\mu_{ii}}{M_{N^i}} \ll 1$.

[Blanchet S. et al, Leptogenesis with TeV Scale Inverse Seesaw in SO(10), Phys. Rev.D82, 115025 (2010).]

Contd...

In our model $M_{N_1} = f$, $M_{N_2} = g$, $\mu_{11} = \mu_{22} = p$ and thus it leads to the diagonalising matrix of M in our model as

$$U_1 = \begin{pmatrix} -\frac{1}{2f}(p + \sqrt{4f^2 + p^2}) & 1 \\ -\frac{1}{2f}(p - \sqrt{4f^2 + p^2}) & 1 \end{pmatrix} \quad (21)$$

$$U_2 = \begin{pmatrix} -\frac{1}{2g}(p + \sqrt{4g^2 + p^2}) & 1 \\ -\frac{1}{2g}(p - \sqrt{4g^2 + p^2}) & 1 \end{pmatrix} \quad (22)$$

Contd..

The expressions for α_1 and α_2 are obtained as,

$$\cos\alpha_1 \simeq \frac{1}{\sqrt{2}}\left(1 + \frac{p}{4f}\right), \sin\alpha_1 \simeq \frac{1}{\sqrt{2}}\left(1 - \frac{p}{4f}\right) \quad (23)$$

$$\cos\alpha_2 \simeq \frac{1}{\sqrt{2}}\left(1 + \frac{p}{4g}\right), \sin\alpha_2 \simeq \frac{1}{\sqrt{2}}\left(1 - \frac{p}{4g}\right) \quad (24)$$

Comparing these matrices arising from our model with the previous equation and with further simplifications, we obtain the expressions for $e^{i(\theta_1 - \theta_2)}$ as,

$$e^{i(\theta_1 - \theta_2)} = \frac{32fg}{(4g + p)(4f - p)} \quad (25)$$

[Gautam N., Das M.K., Neutrino mass, leptogenesis and sterile neutrino dark matter in inverse seesaw framework, International Journal of Modern Physics A 36(2021) 2150146.]

Numerical Analysis

- The light neutrino mass matrix can be written as,

$$M_\nu = U_{PMNS} M_\nu^{\text{diag}} U_{PMNS}^T \quad (26)$$

where $U_{PMNS} = U.P$

$$U = \begin{pmatrix} c_{12}c_{13} & s_{12}c_{13} & s_{13}e^{-i\delta} \\ s_{12}c_{23} - c_{12}s_{13}s_{23}e^{i\delta} & c_{12}c_{23} - s_{12}s_{13}s_{23}e^{i\delta} & c_{13}s_{23} \\ s_{12}s_{23} - c_{12}s_{13}c_{23}e^{i\delta} & -c_{12}s_{23} - s_{12}s_{13}c_{23}e^{i\delta} & c_{13}c_{23} \end{pmatrix}$$

where $c_{ij} = \cos\theta_{ij}$ and $s_{ij} = \sin\theta_{ij}$. $P = \text{diag}(1, e^{\frac{i\alpha_{21}}{2}}, e^{\frac{i\alpha_{31}}{2}})$

- The diagonal mass matrix of the light neutrinos can be written as,
 $m_\nu^{\text{diag}} = \text{diag}(0, \sqrt{m_1^2 + \Delta m_{solar}^2}, \sqrt{m_1^2 + \Delta m_{atm}^2})$ for normal hierarchy and
 $m_\nu^{\text{diag}} = \text{diag}(\sqrt{m_3^2 + \Delta m_{atm}^2}, \sqrt{\Delta m_{solar}^2 + \Delta m_{atm}^2}, m_3)$ for inverted hierarchy.

Table I: Latest Global Fit Neutrino Oscillation Data. [NuFIT 5.3 (2024)]

Results and Discussion

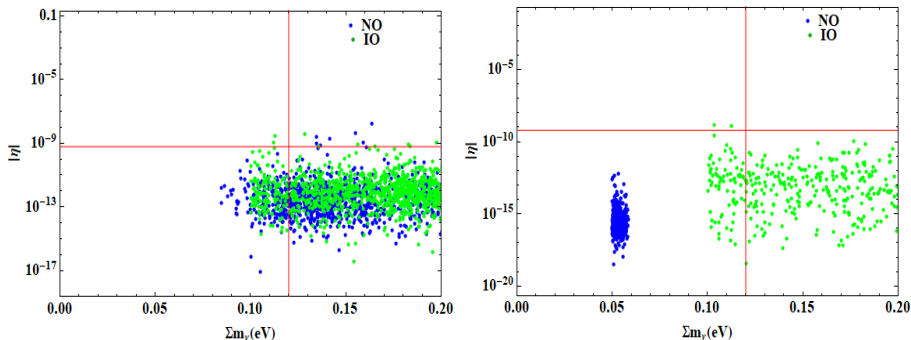

Figure: BAU as a function of sum of neutrino masses in NO and IO for textures A1 and A2. The horizontal red line represents the Planck limits on BAU.

[Gautam, N., Das., M. K.; Phys.Lett.B 833 (2022) 1373021]

Figure: BAU as a function of the sum of neutrino masses in class in A3 and B1. The horizontal red line represents the Planck limits on BAU.

[Gautam, N., Das., M. K.; Phys.Lett.B 833 (2022) 1373021]

Figure: BAU as a function of the sum of neutrino masses in class the classes B2 and B3. The horizontal red line represents the Planck limits on BAU.

[Gautam, N., Das., M. K.; Phys.Lett.B 833 (2022) 1373021]

Discussion

- [A1](#) leads to the BAU that is consistent with the latest cosmology data. A small space is available that agrees with both the experimental data on mass-squared differences and the current cosmological bound.
- [A2](#) does not yield the observed BAU in the case of NO. However, the texture A2 in ISS(2,3) can lead to the observed BAU in IO.
- In [A3](#), a small parameter space is available that agrees with both the limits in NO. This texture can yield BAU in IO as well.

Discussion

- [A1](#) leads to the BAU that is consistent with the latest cosmology data. A small space is available that agrees with both the experimental data on mass-squared differences and the current cosmological bound.
- [A2](#) does not yield the observed BAU in the case of NO. However, the texture A2 in ISS(2,3) can lead to the observed BAU in IO.
- In [A3](#), a small parameter space is available that agrees with both the limits in NO. This texture can yield BAU in IO as well.

Discussion

- Texture **B1** can lead to the correct BAU in NO and does not yield the observed BAU in the case of IO.
- The amount of BAU obtained in **B2** is quite less than the observed values in both cases.
- The texture **B3** in NO is good in the prediction of the observed BAU. However, a small parameter space of B3 is in good agreement with the upper limits on the sum of the light neutrino masses.

Discussion

- Texture **B1** can lead to the correct BAU in NO and does not yield the observed BAU in the case of IO.
- The amount of BAU obtained in **B2** is quite less than the observed values in both cases.
- The texture **B3** in NO is good in the prediction of the observed BAU. However, a small parameter space of B3 is in good agreement with the upper limits on the sum of the light neutrino masses.

Conclusion

Conclusion

- We have studied the effect of **two zero textures** of **Dirac mass matrix** M_d on leptogenesis in the framework of inverse seesaw ISS(2,3).
- The textures **A1, A3, B1, and B3** in **NO** give rise to the observed **baryon asymmetry**. The other three textures in NO are not in agreement with the current cosmological limit on BAU.

Conclusion

- We have studied the effect of **two zero textures** of **Dirac mass matrix** M_d on leptogenesis in the framework of inverse seesaw ISS(2,3).
- The textures **A1, A3, B1, and B3** in **NO** give rise to the observed **baryon asymmetry**. The other three textures in NO are not in agreement with the current cosmological limit on BAU.
- One can obtain the required BAU in **A1, A2** in **IO**

Conclusion

- We have studied the effect of **two zero textures** of **Dirac mass matrix** M_d on leptogenesis in the framework of inverse seesaw ISS(2,3).
- The textures **A1, A3, B1, and B3** in **NO** give rise to the observed **baryon asymmetry**. The other three textures in NO are not in agreement with the current cosmological limit on BAU.
- One can obtain the required BAU in **A1, A2** in **IO**
- **B2** fails to explain the required BAU in both NO and IO

Conclusion

- We have studied the effect of **two zero textures** of **Dirac mass matrix** M_d on leptogenesis in the framework of inverse seesaw ISS(2,3).
- The textures **A1, A3, B1, and B3** in **NO** give rise to the observed **baryon asymmetry**. The other three textures in NO are not in agreement with the current cosmological limit on BAU.
- One can obtain the required BAU in **A1, A2** in **IO**
- **B2** fails to explain the required BAU in both NO and IO
- All the textures are in good agreement with the current cosmological limit on **the sum of the light neutrino masses**.
