

# Measurement of jet substructure with the ATLAS detector

*Thursday 18 July 2024 11:45 (15 minutes)*

Measurements of the substructure of jets are presented using 140 fb<sup>-1</sup> of proton-proton collisions with  $\sqrt{s}=13$  TeV center-of-mass energy recorded with the ATLAS detector at CERN Large Hadron Collider. Various results are presented including the measurement of non-perturbative track functions, or, the ratio of a jet transverse momentum carried by its charged constituents to its complete transverse momentum. The first differential cross-section measurement of Lund sub-jet multiplicities using dijet events and the measurement of the Lund Jet Plane in ttbar events are also shown in this contribution. Moreover, the measurements of the substructure of top-quark jets are presented using top quarks which are reconstructed with Antikt algorithm with a radius parameter  $R=1.0$ .
