

# Searches for pairs of Higgs bosons at CMS

Cristina Mantilla-Suarez (Fermilab, UVA)  
For the CMS collaboration

ICHEP 2024

# Outline

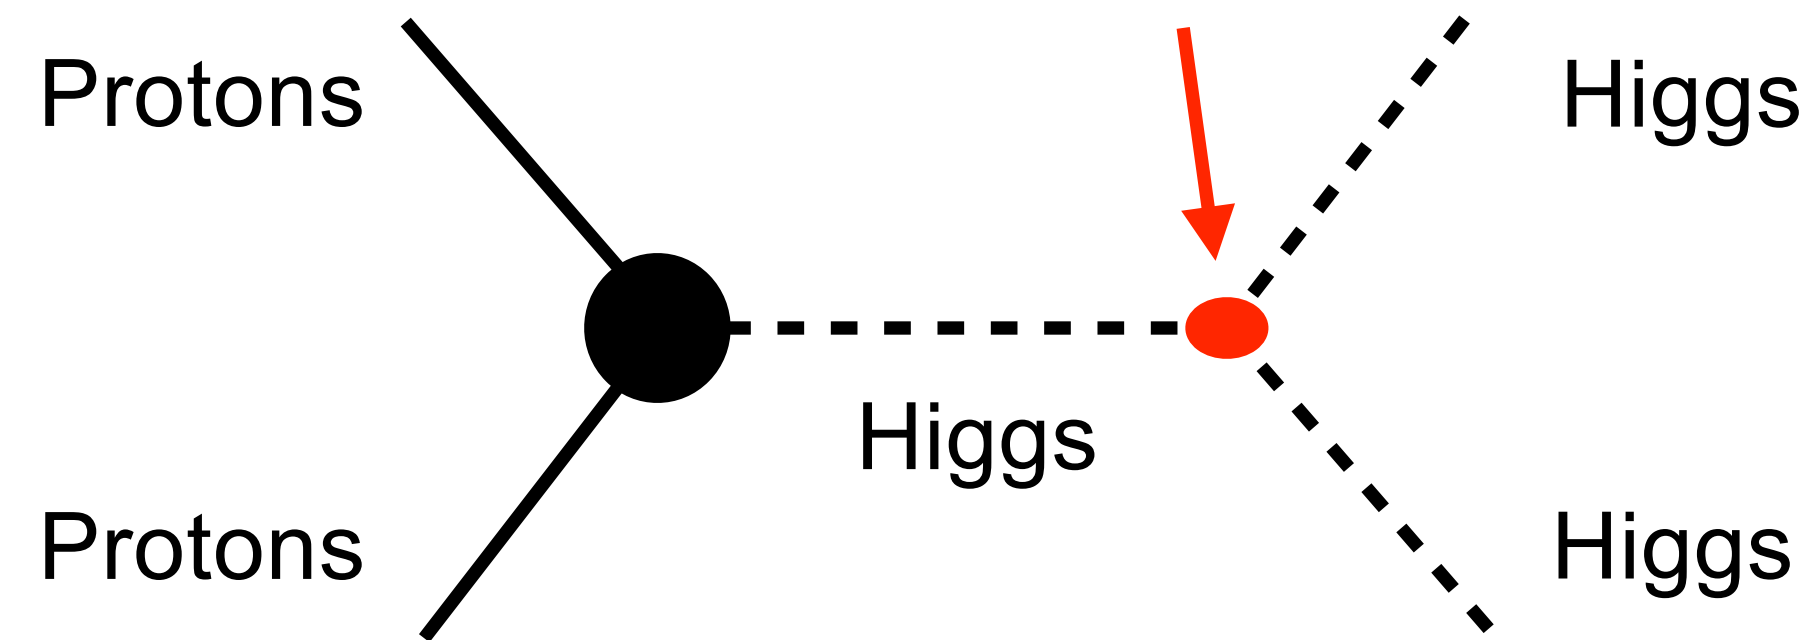

---

- HH: motivation and phenomenology
- Survey of CMS results with 13 TeV data
- NEW result with 13 TeV data
- Run-3 prospects
- Summary

# Higgs pair production

---

- A direct probe of the Higgs self-interaction ( $\lambda$ )

# Higgs pair production

- A direct probe of the Higgs self-interaction ( $\lambda$ )

- This term helps to map out the shape of the Higgs potential

The SM prediction of  $V$ :  
(expansion at the minimum)

$$V(h) = V_0 + \underbrace{\frac{1}{2}m_H^2 h^2}_{\text{Mass Term}} + \underbrace{\lambda_{hhh} v h^3}_{\text{HH production}} + \underbrace{\frac{1}{4}\lambda_{hhhh} h^4}_{\text{HHH production}}$$

- In the SM:  $\lambda_{hhh} = \lambda_{hhhh} \sim 1/8$

# HH production predictions

- Goal is to *accurately* and *precisely* measure  $\kappa_\lambda = \lambda_{\text{obs}}/\lambda_{\text{SM}} = 1$
- HH small at the LHC: **~1000x** smaller than H
  - Destructive interference between diagrams, for example in ggHH:

# HH production predictions

- Goal is to *accurately* and *precisely* measure  $\kappa_\lambda = \lambda_{\text{obs}}/\lambda_{\text{SM}} = 1$
- HH small at the LHC: **~1000x** smaller than H
  - Destructive interference between diagrams, for example in ggHH:

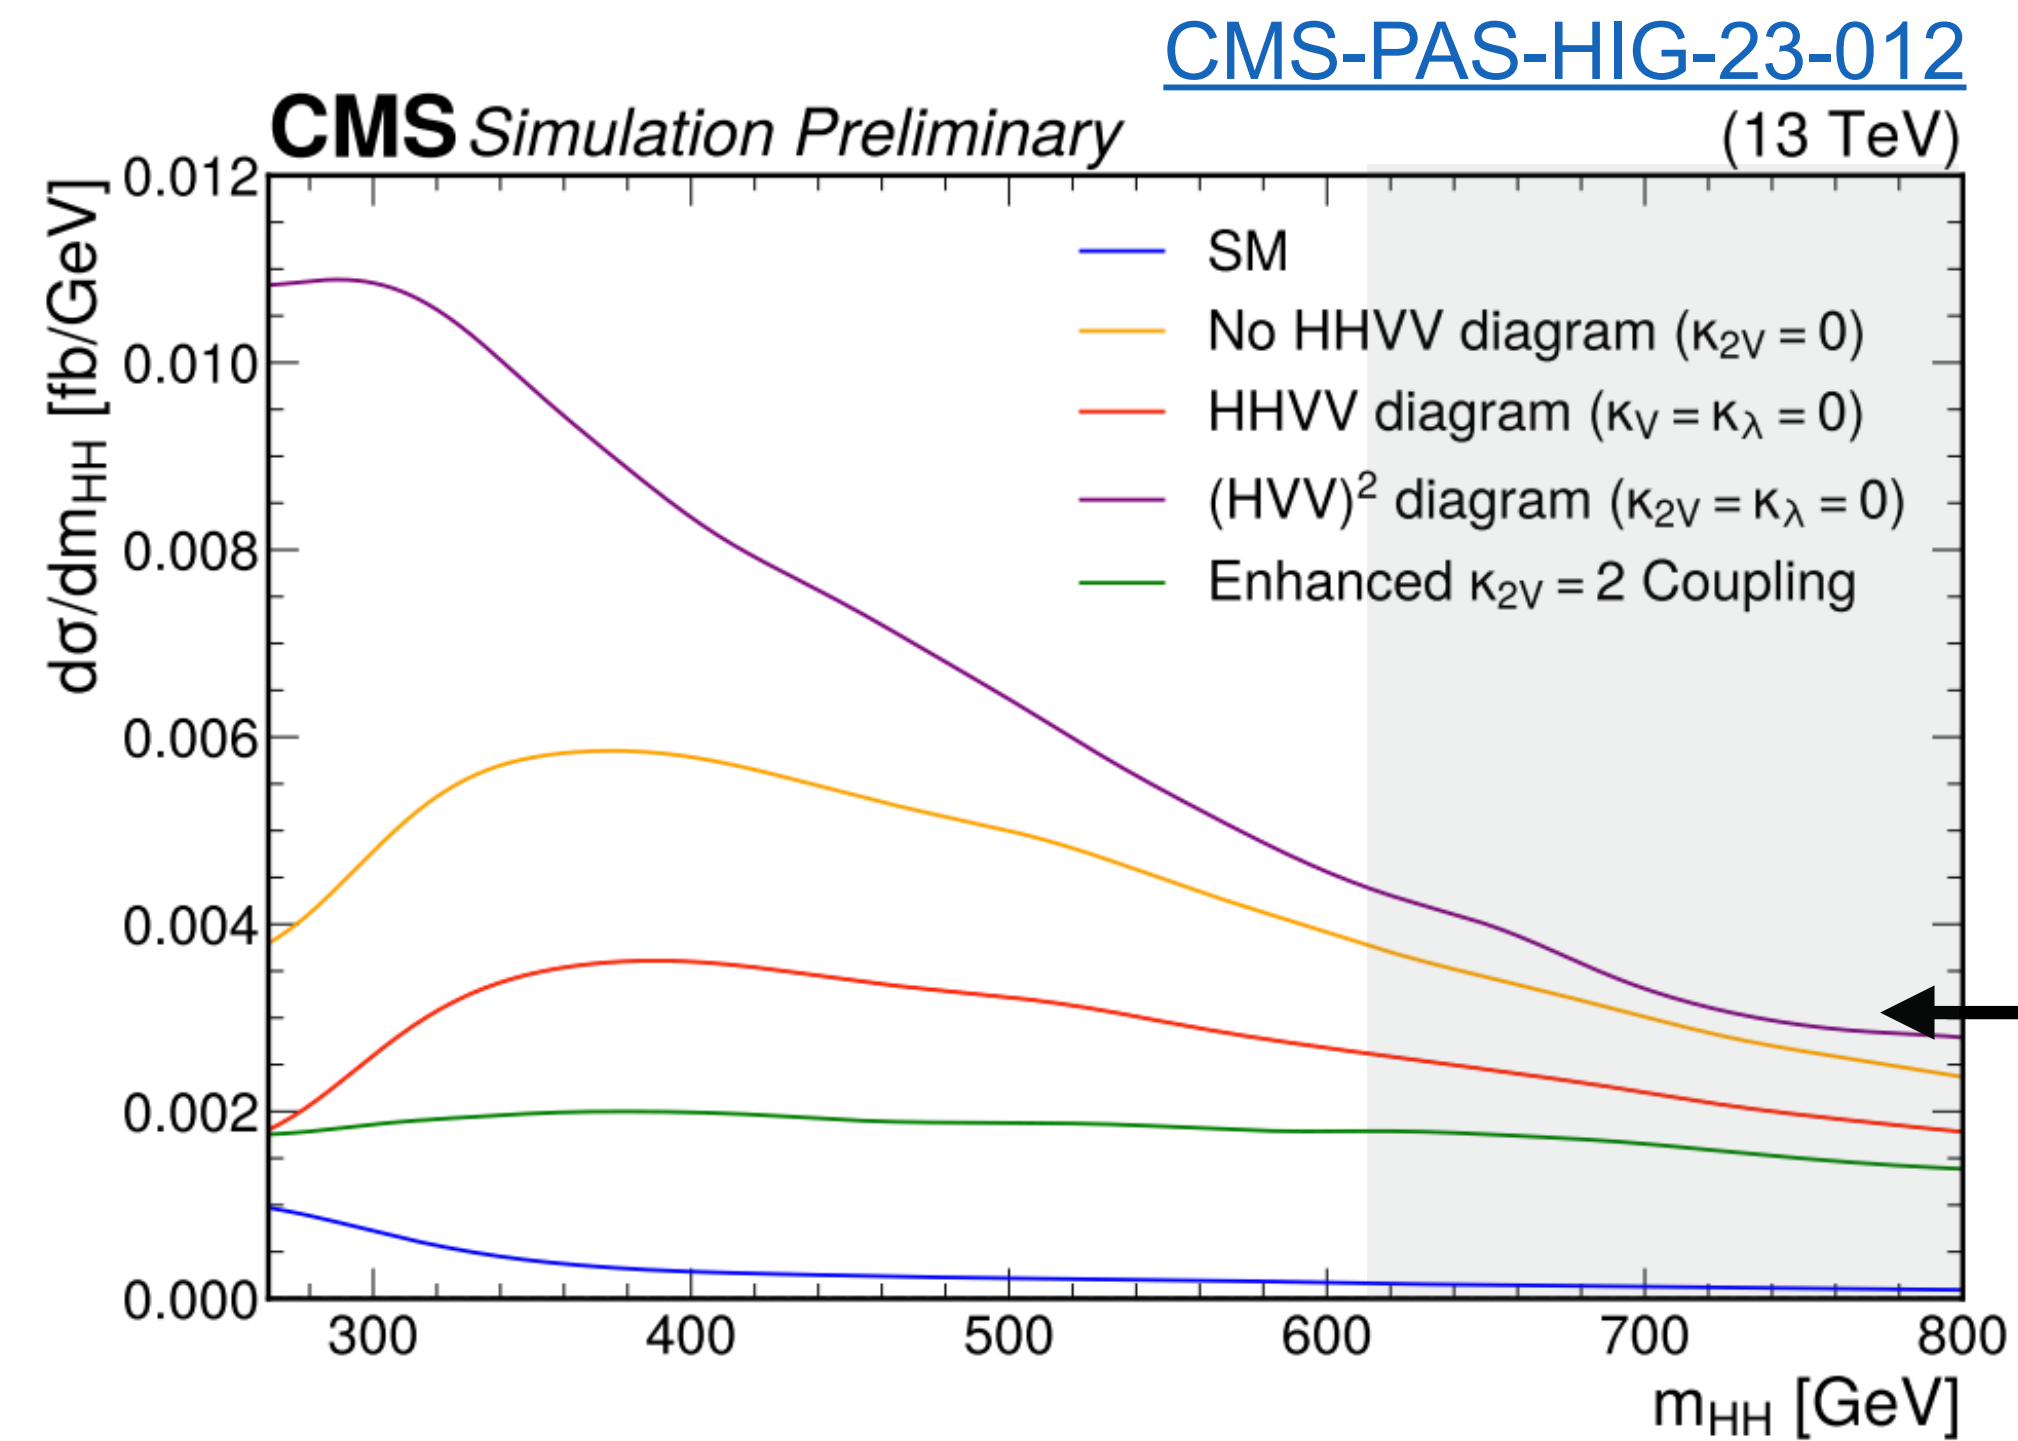

Activate new vertices: HEFT  
I. Dutta talk

Modify  $\lambda_{hhhh}$ : differences at low  $p_T$

# HH production beyond the self-coupling

- HH pairs *also* probe other couplings
- For example: VBF production probes HHVV interaction,  $\kappa_{2V}$

Differences still relevant at high  $p_T$

# Survey of HH results by CMS

- Higgs boson decay branching ratios result in rich set of final states
- “Big 3” final states driving the sensitivity

	$b\bar{b}$	$WW_{\geq 1\ell}$	$WW_{4q}$	$\tau\tau$	$ZZ$	$\gamma\gamma$
$b\bar{b}$	34%					
$WW_{\geq 1\ell}$	13.4%	1.3%

bbbb:

Controlling background  
uncertainties at O(%)

bb $\tau\tau$ :

Sensitivity driven by  $\tau_h\tau_h$ .  
Hadronic tau triggers are critical

# The “big 3” channels

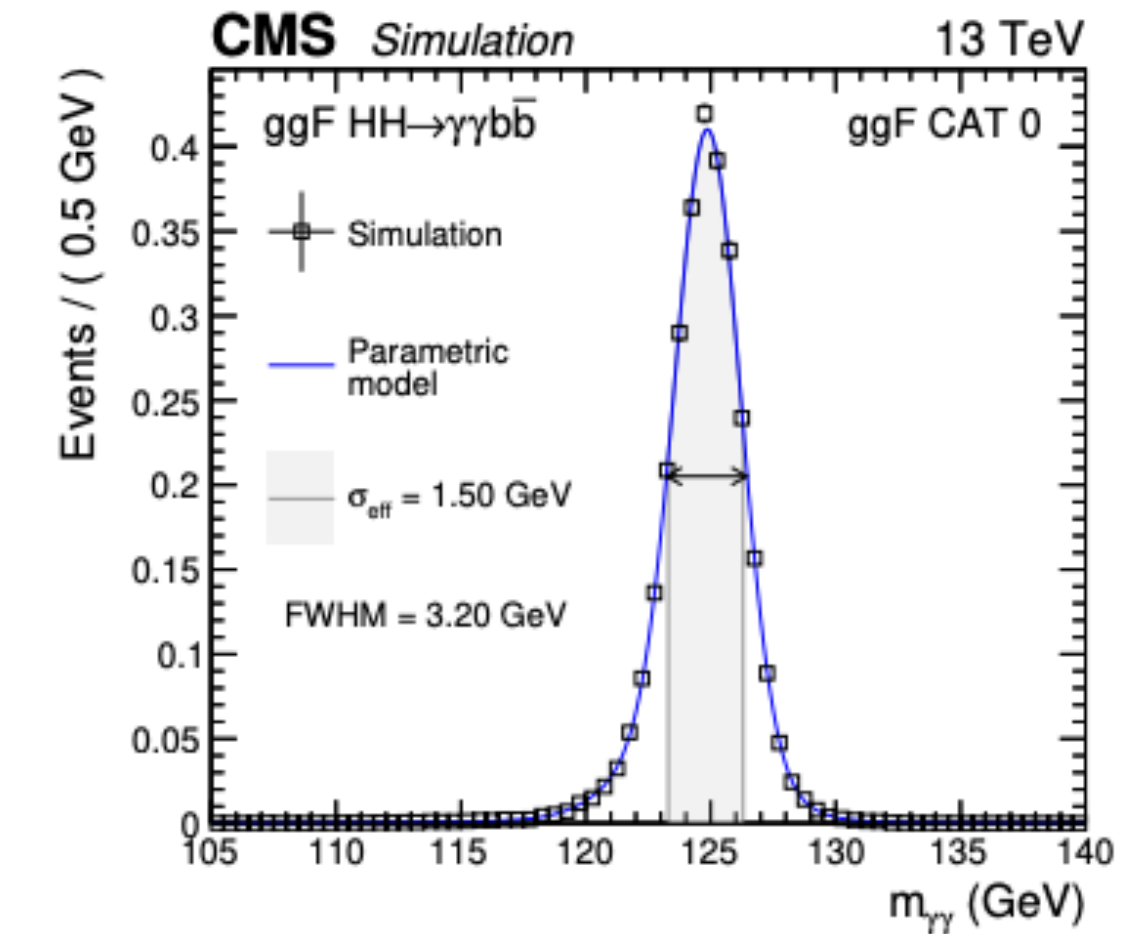

bbbb:

bb $\tau\tau$ :

bb $\gamma\gamma$ :

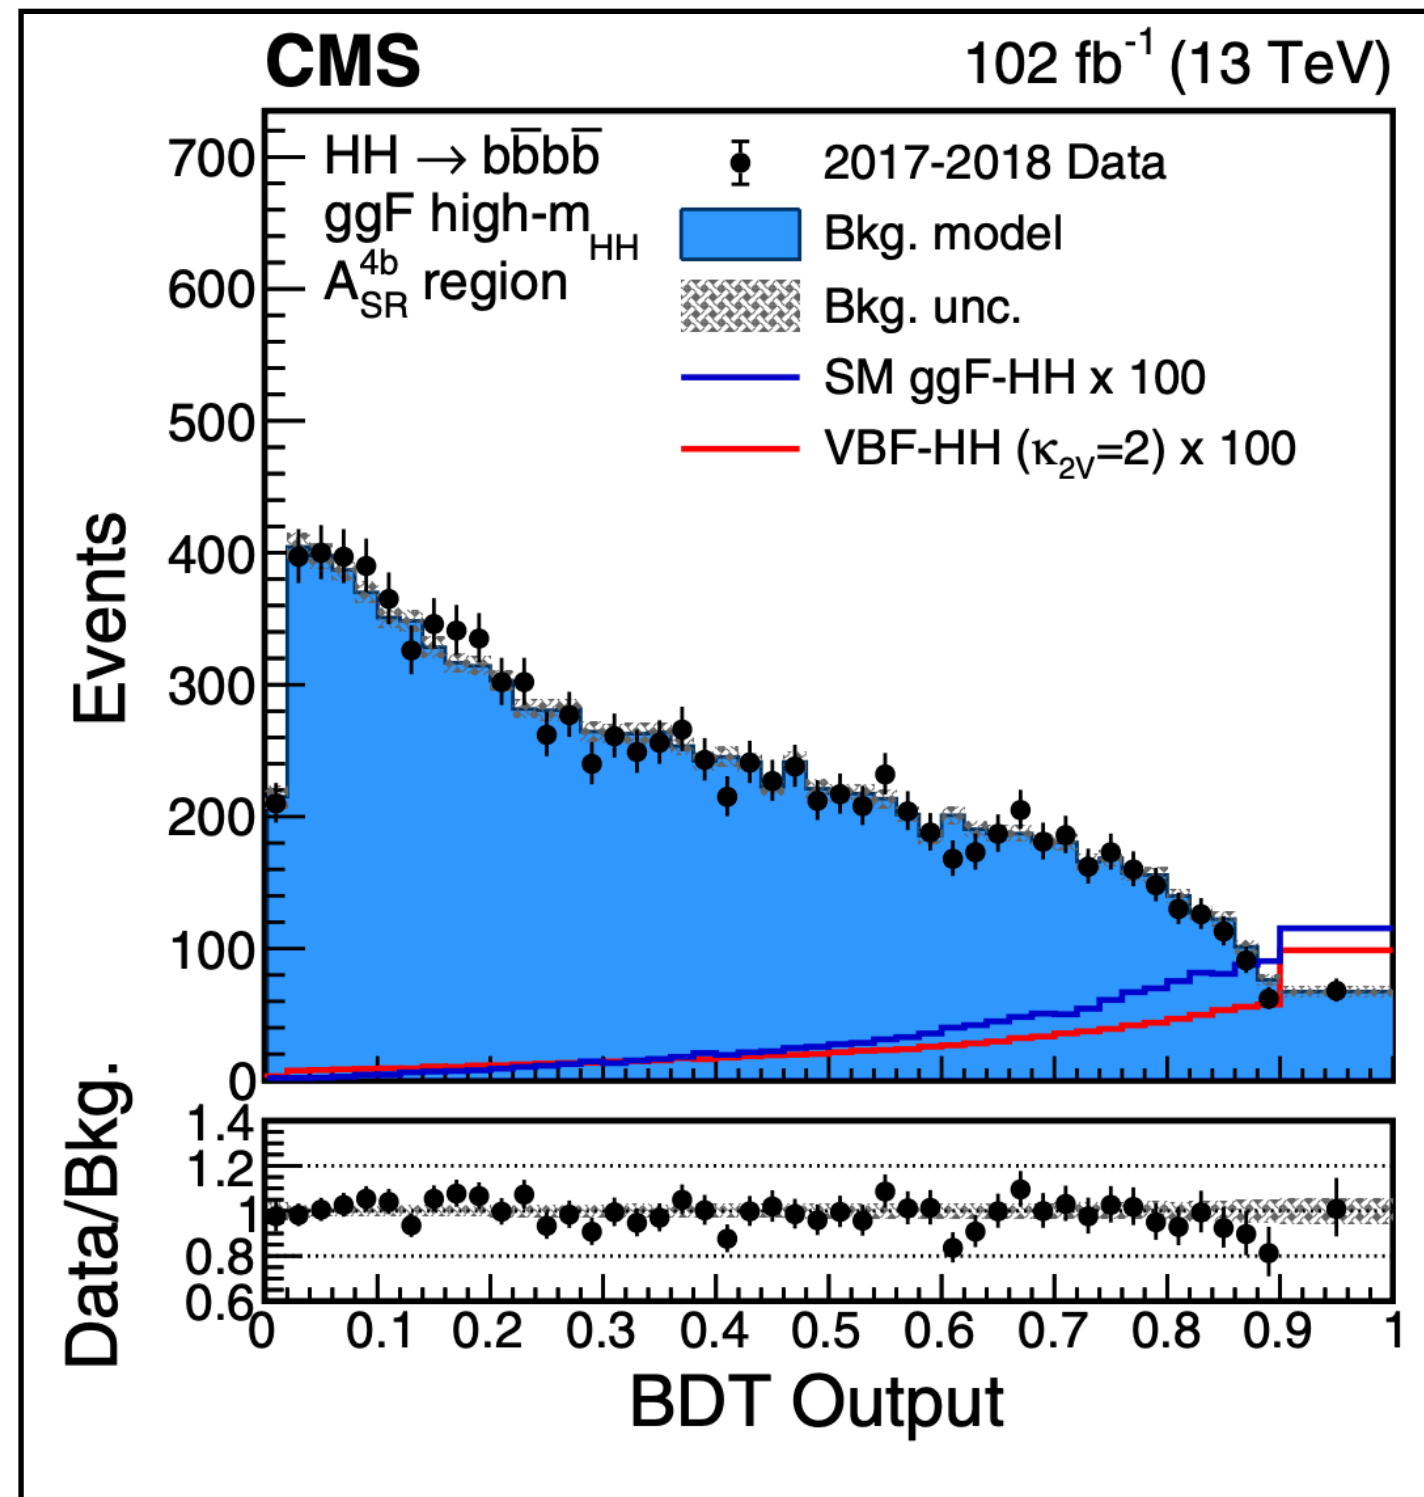

Controlling background uncertainties at O(%)

Sensitivity driven by  $\tau_h \tau_h$ .  
Hadronic tau triggers are critical

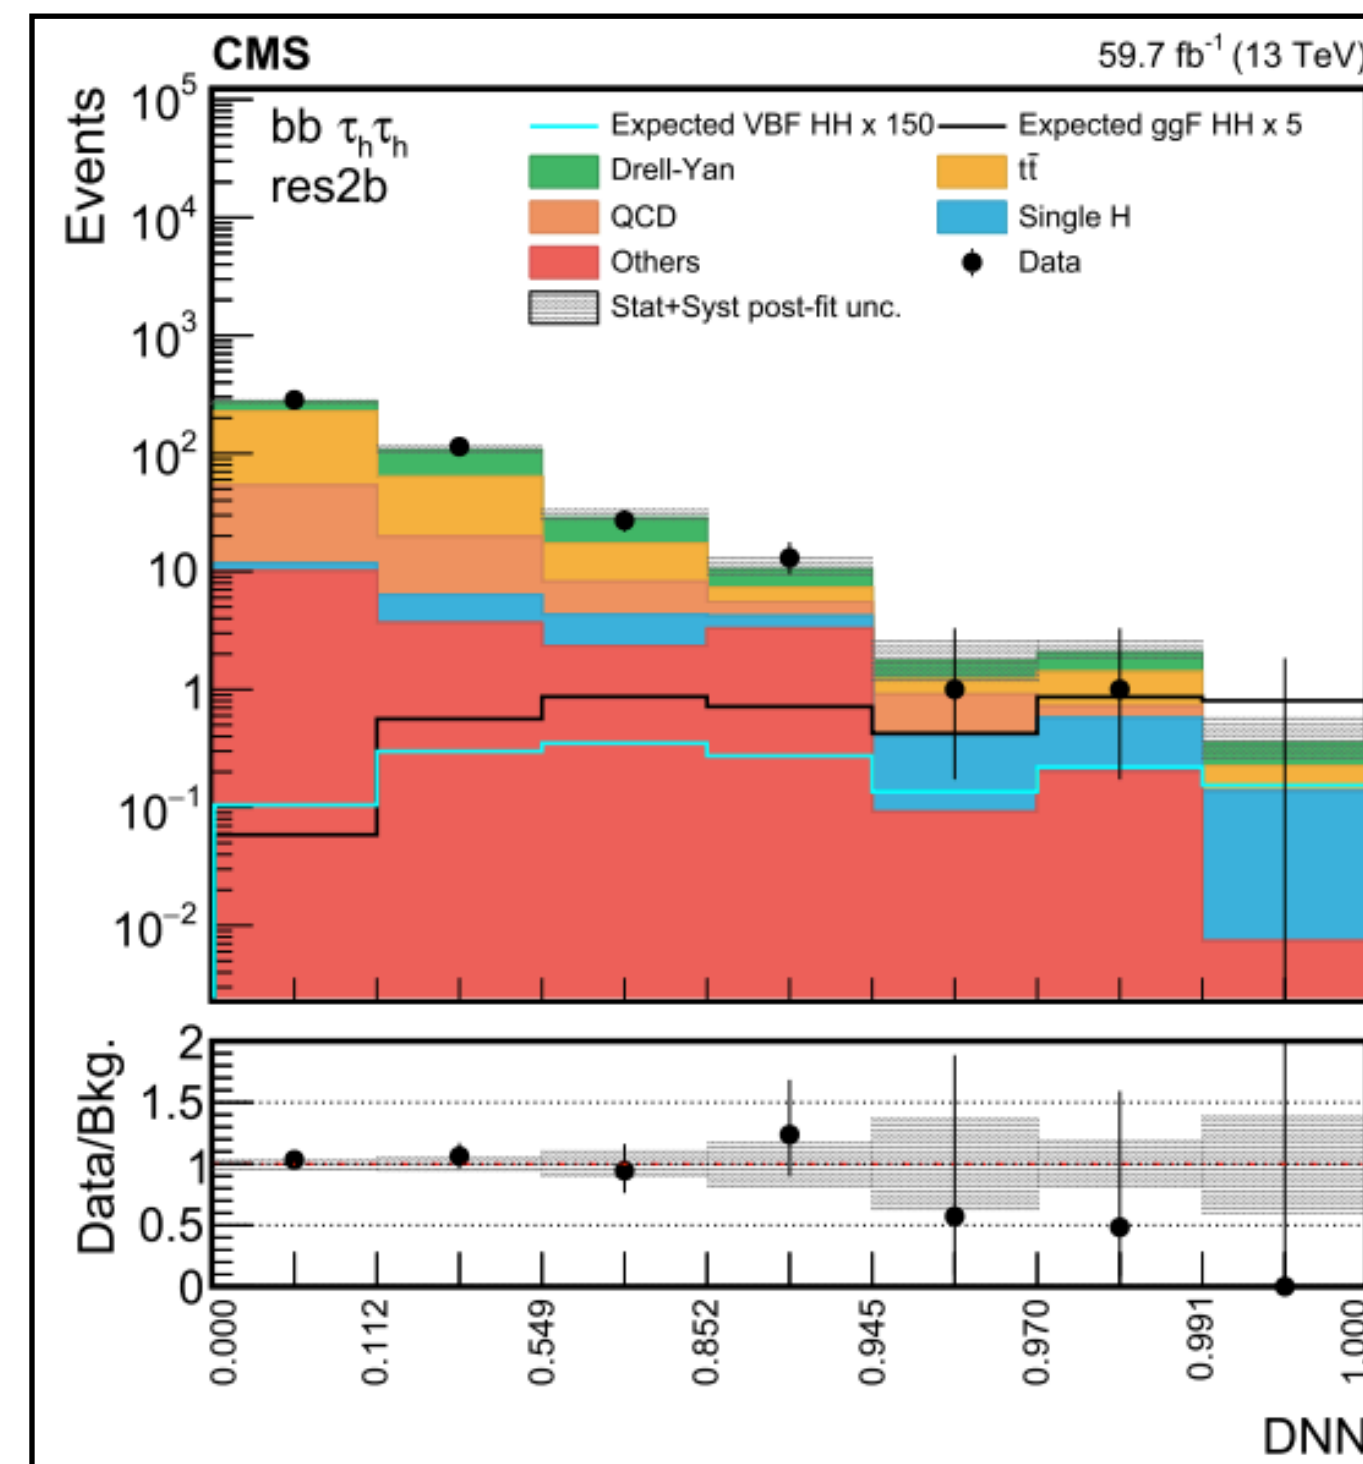

# The “big 3” channels

bbbb:

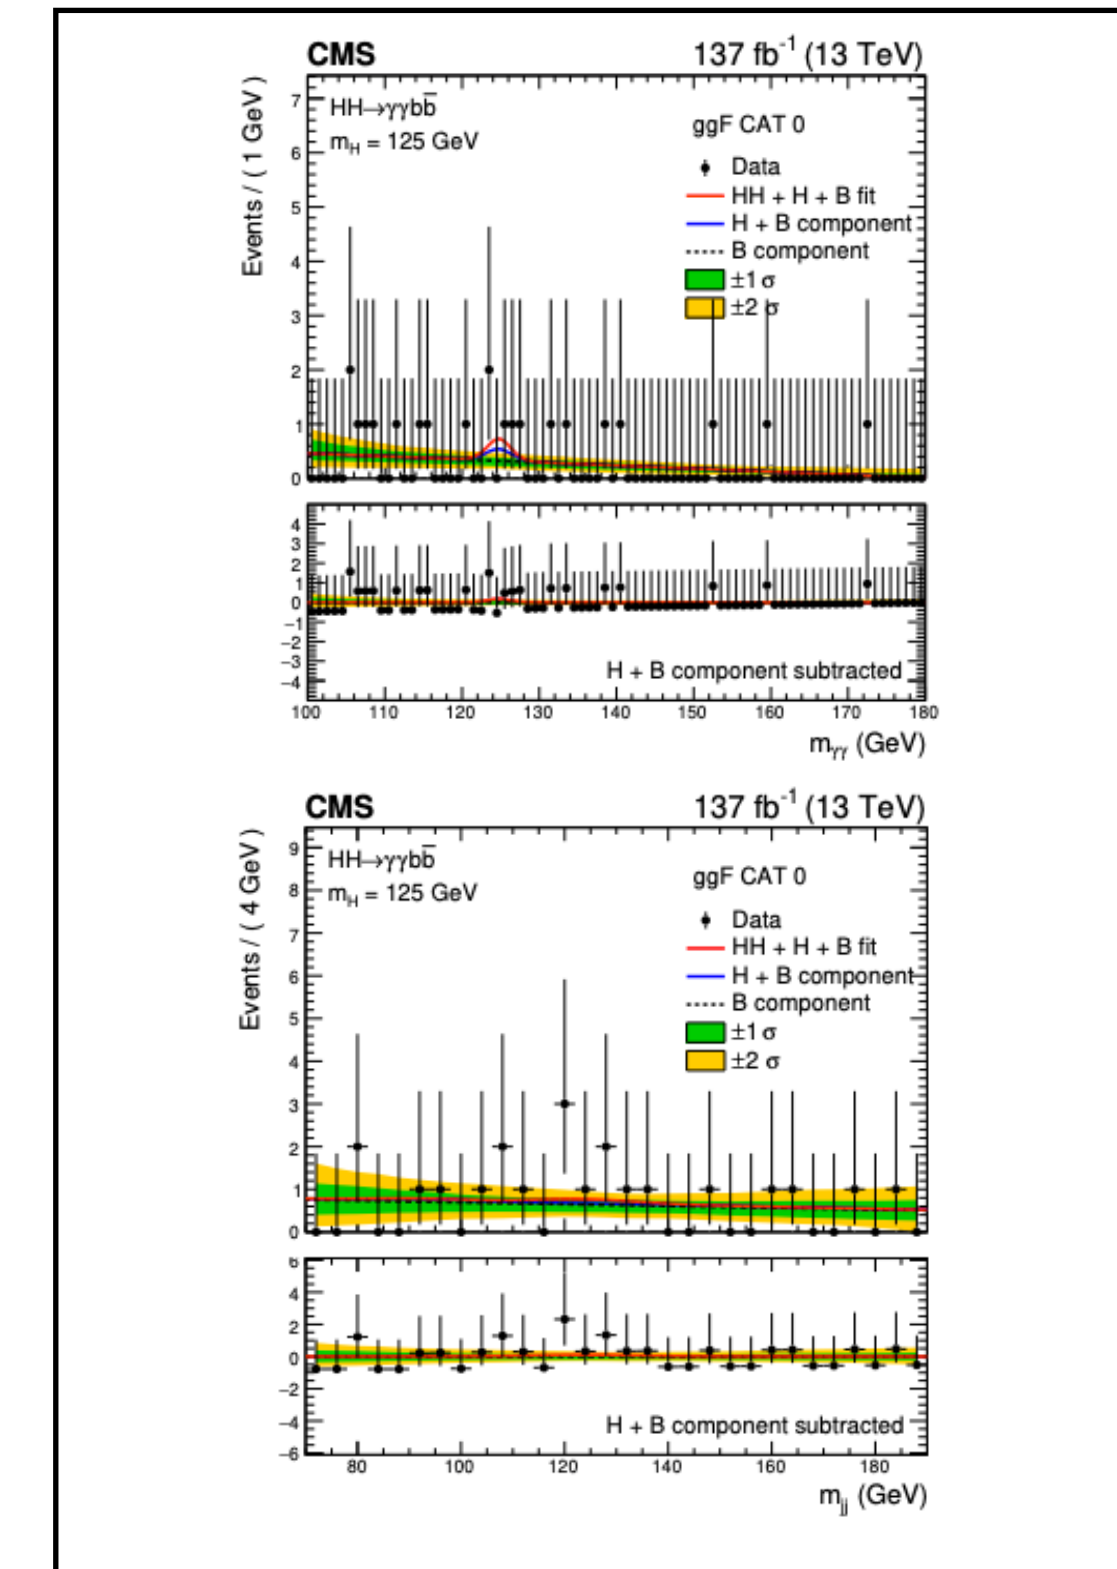

Controlling background uncertainties at O(%)

bb $\tau\tau$ :

Sensitivity driven by  $\tau_h \tau_h$ .  
Hadronic tau triggers are critical

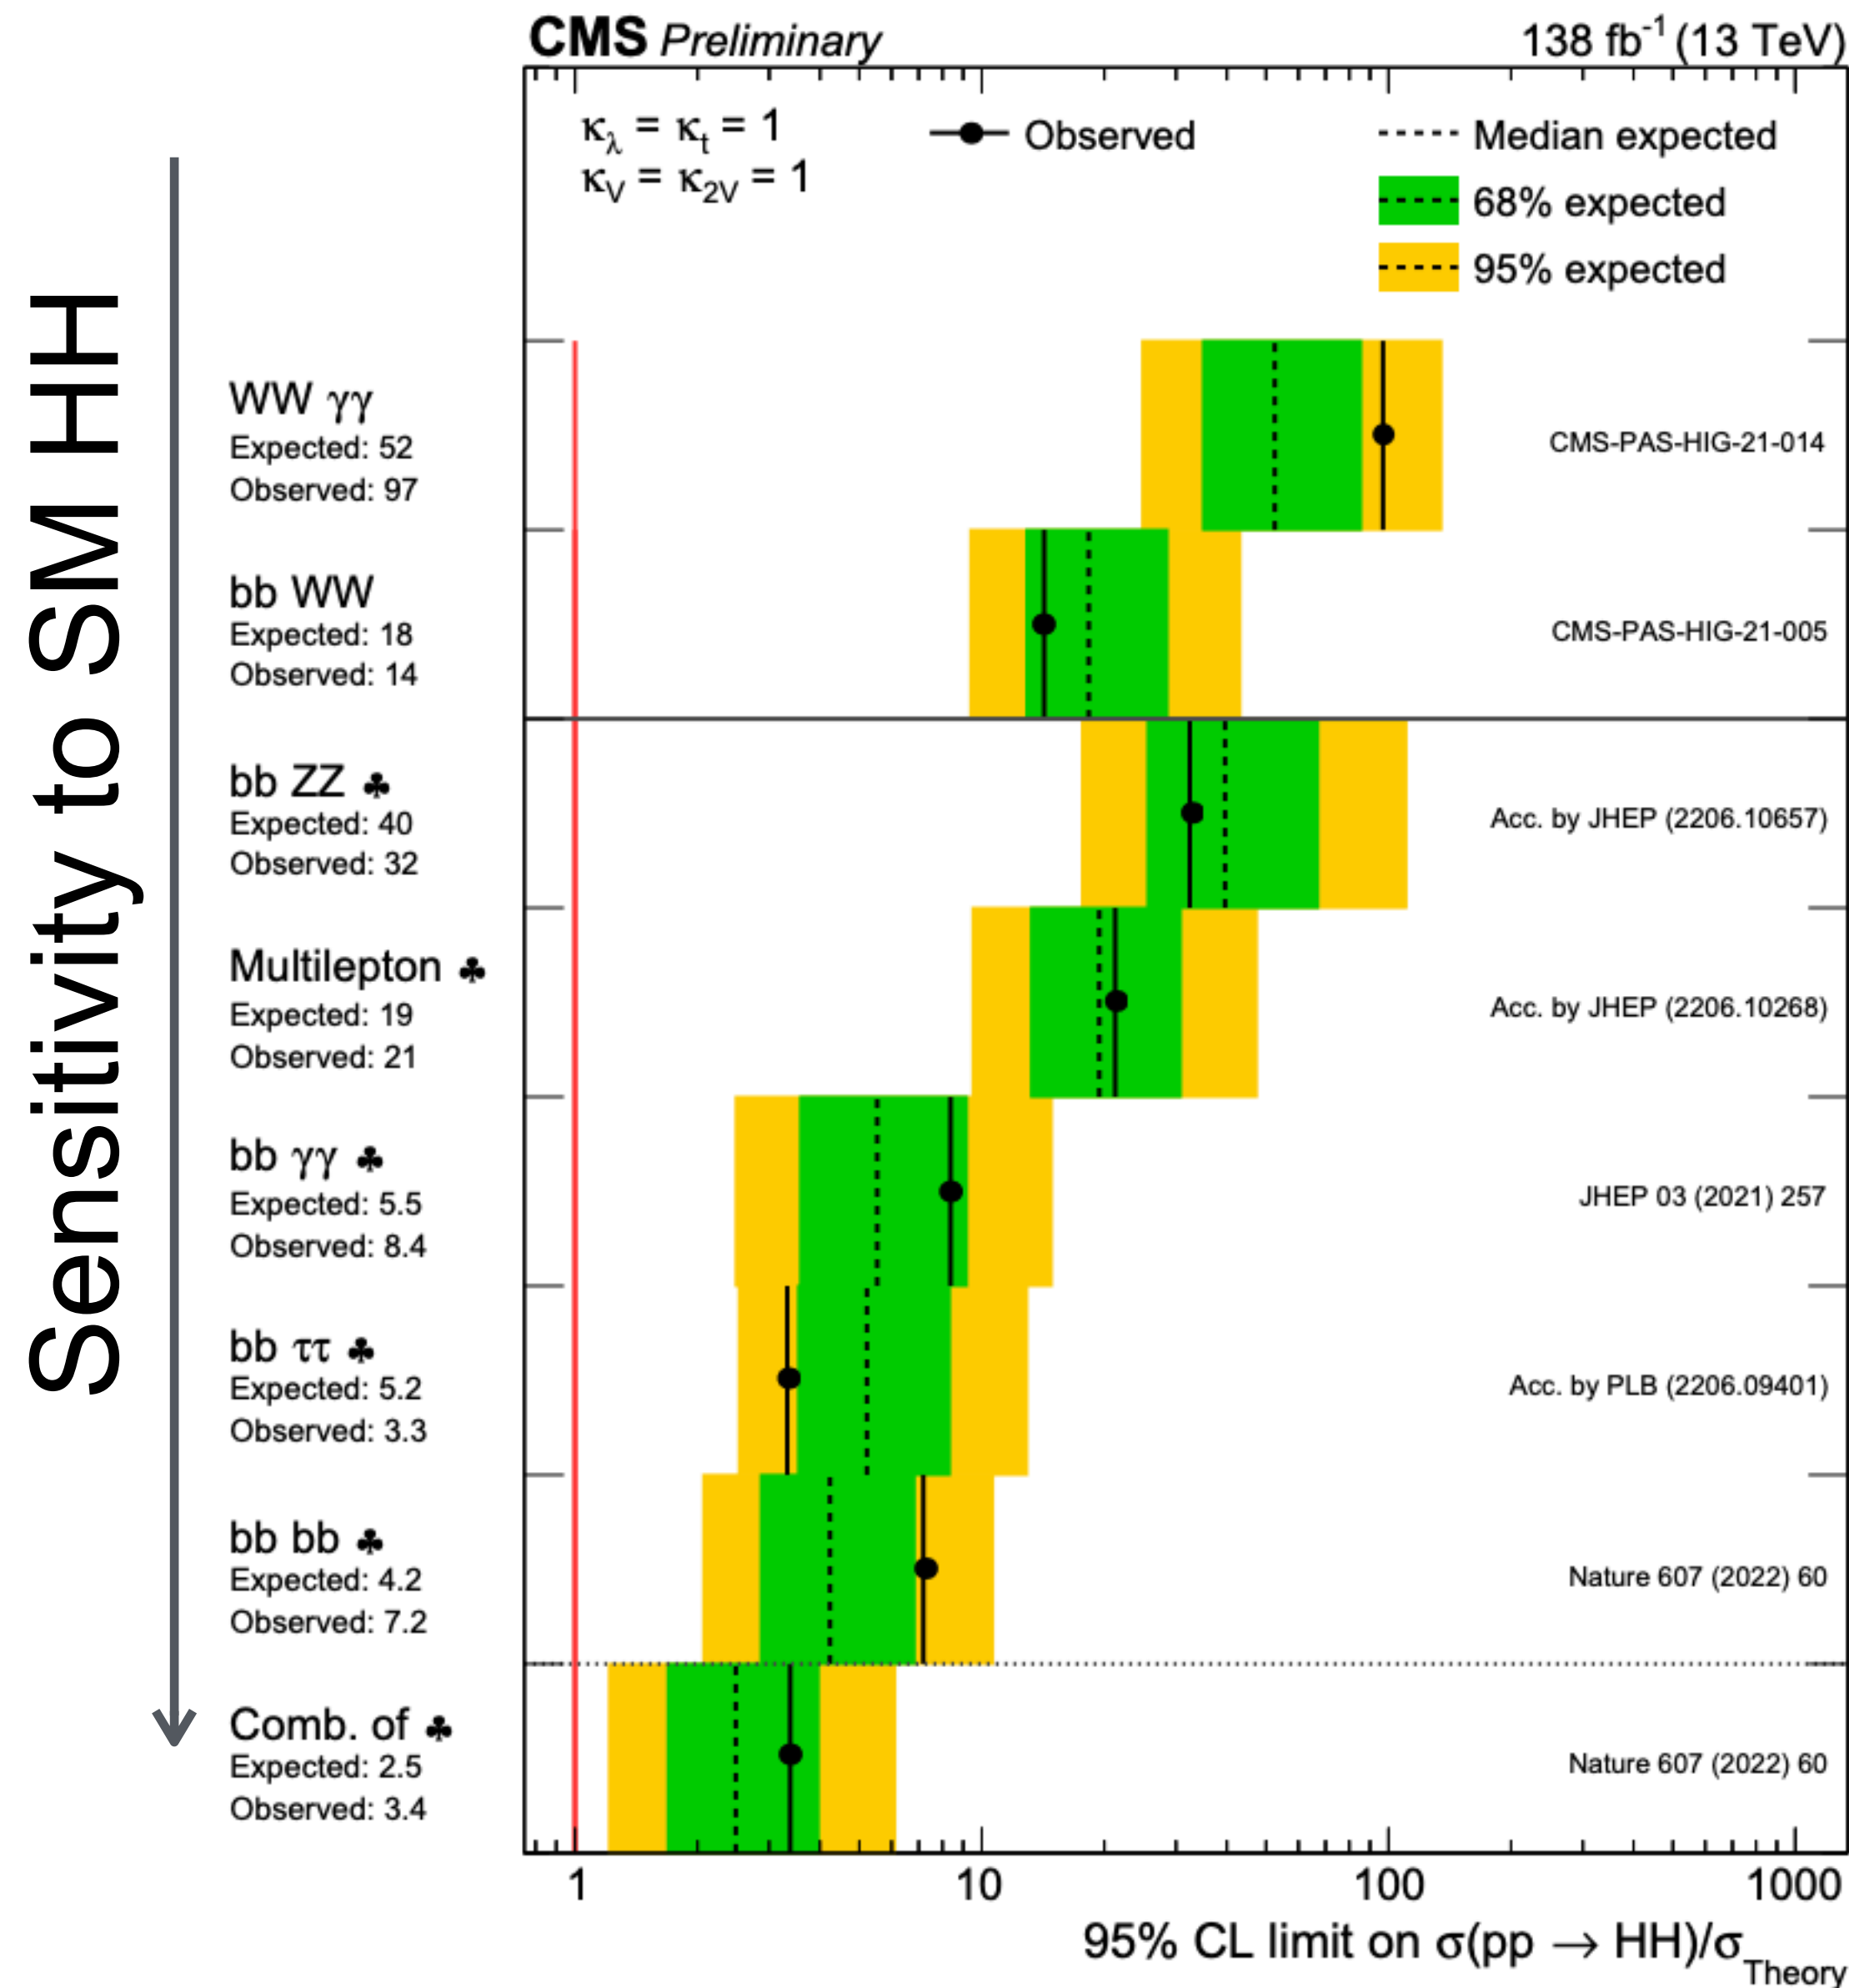

bb $\gamma\gamma$ :

Fit both  $m_{\gamma\gamma}$  and  $m_{jj}$ .  
Energy resolution is key.

# Run-2 so far: relative sensitivities

[CMS Summary Results](#)

Combined sensitivity on  $\sigma/\sigma_{SM}$ :\*

$$\kappa_\lambda \in [-1.24, 6.49]$$

$$\kappa_{2V} \in [0.67, 1.38]$$

$\kappa_{2V} > 0$  driven by boosted regime

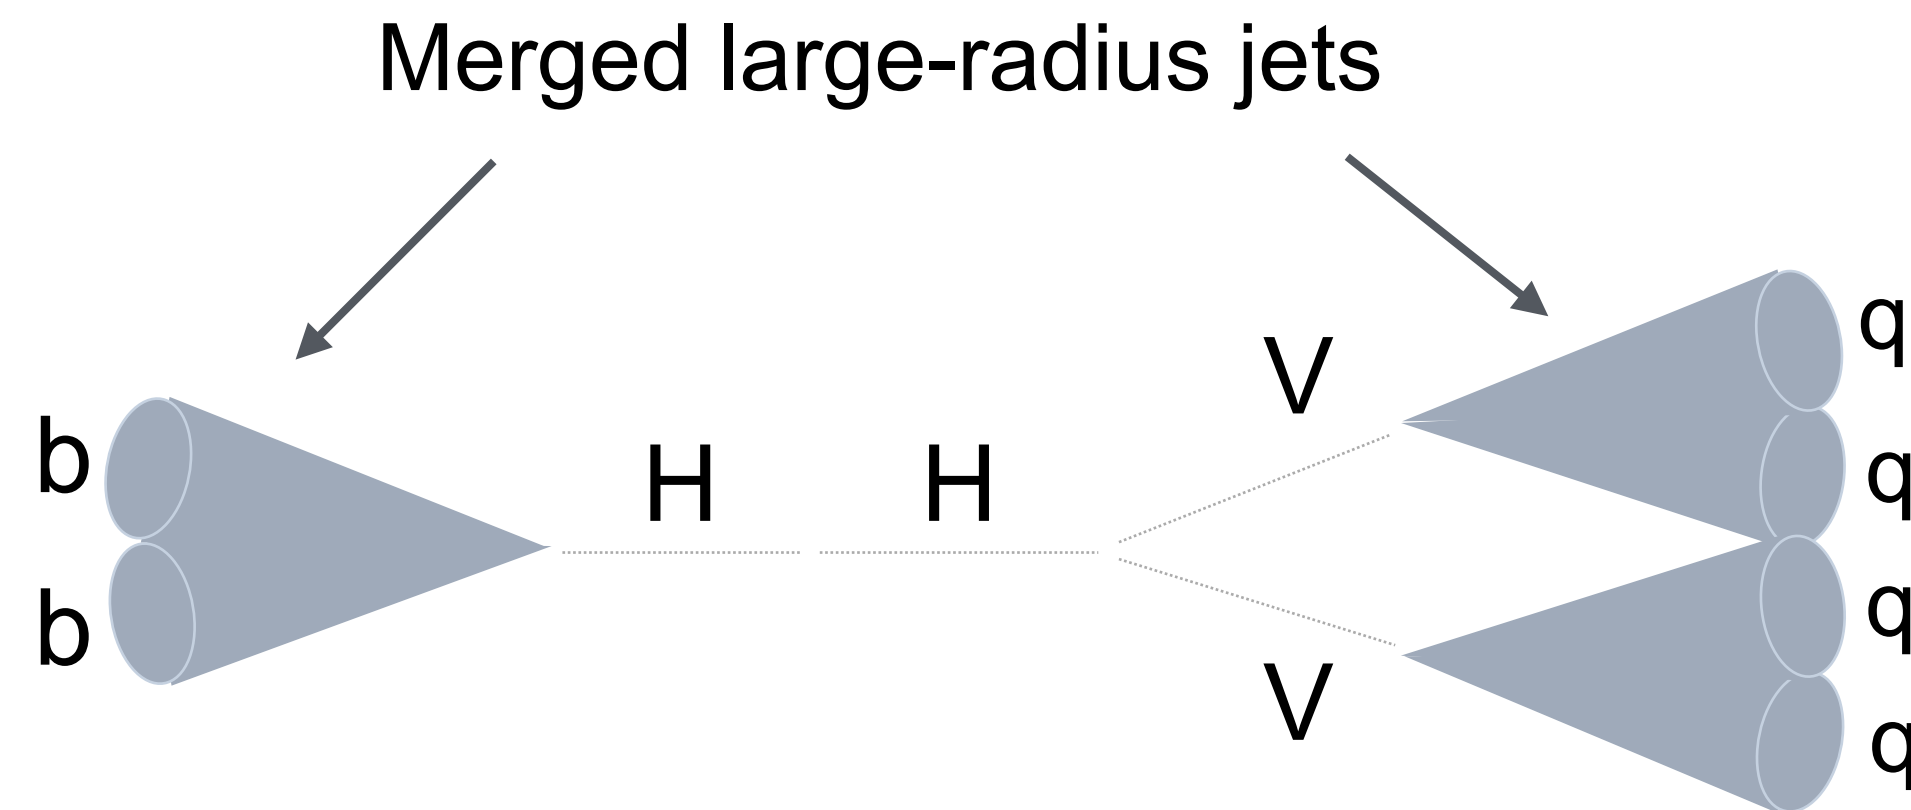

\* assuming other couplings set to 1

# HH (bb VV): all-hadronic

[CMS-PAS-HIG-23-012](#)

- Unexplored final state at the LHC
  - **Includes  $W(qq)$ ,  $Z(qq)$  decays: BR = 13%**
- **Focus on “boosted” regime, high  $p_T$** 
  - QCD background dominant, but reduced
  - Study ggF and VBF production: target  $k_{2V}$  modifications at high  $m_{HH}$

# HH (bb VV): tagging

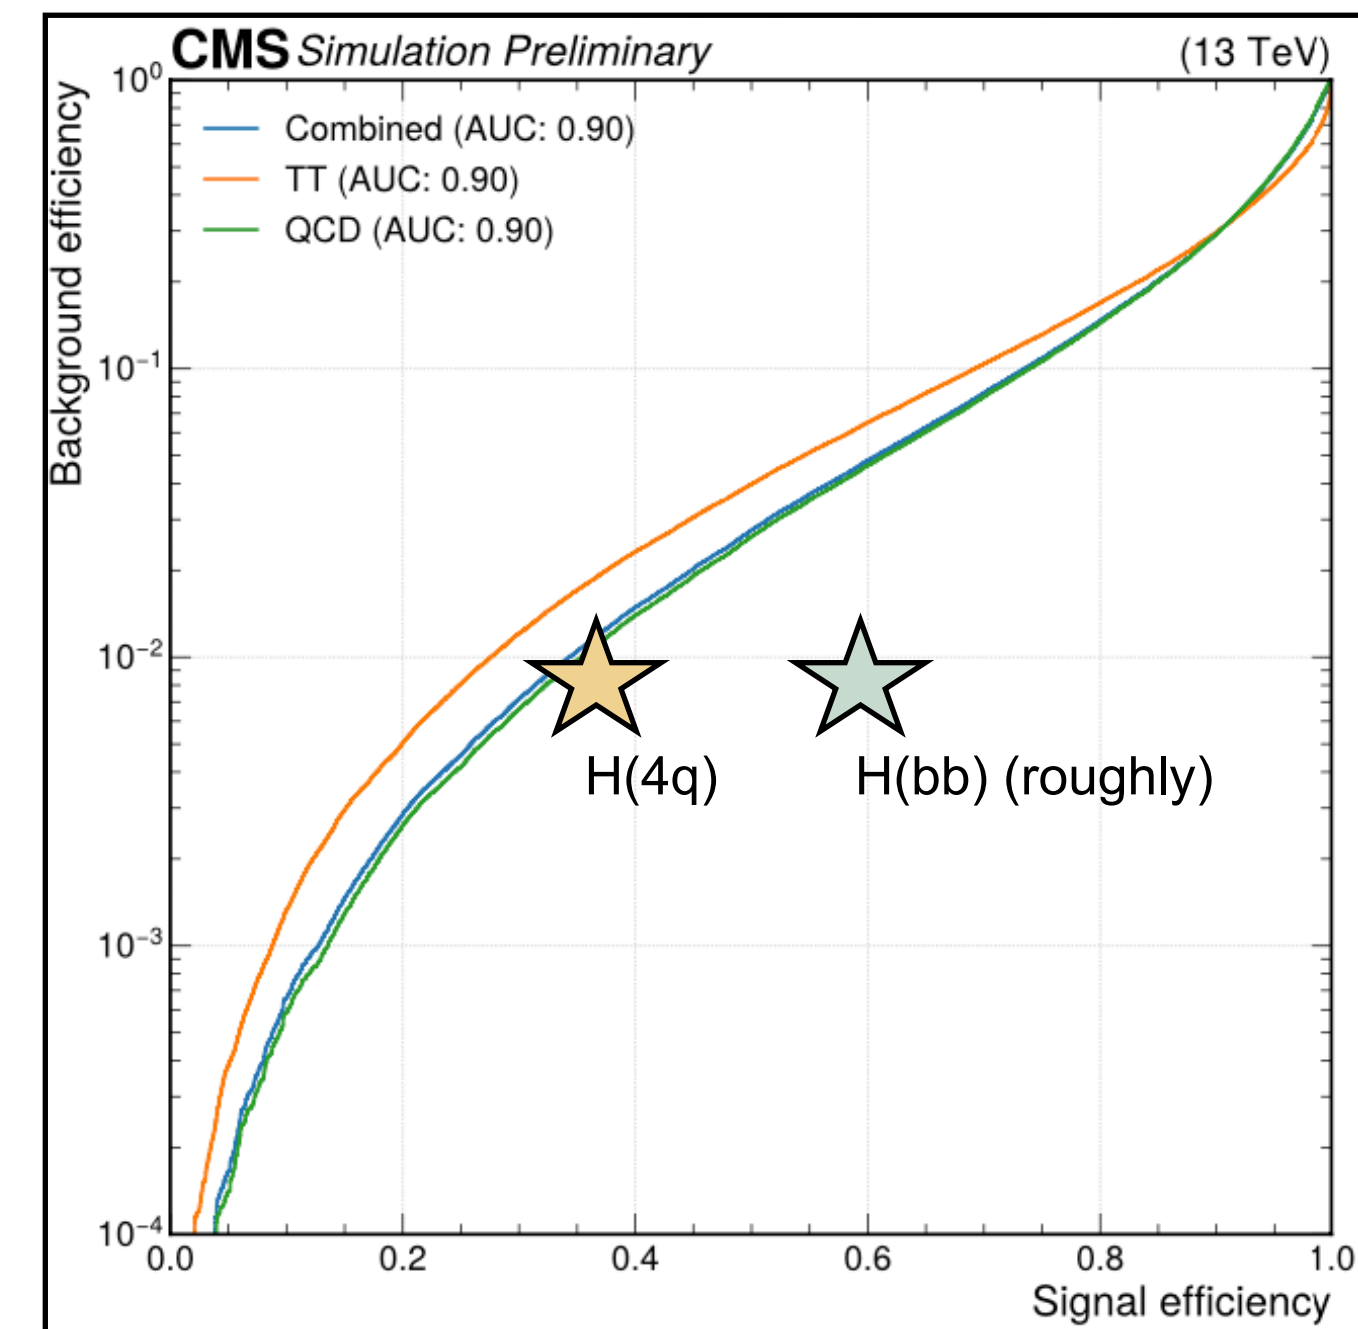

- A “likely” VBF HH(bb VV) event:

bb-tagged Jet

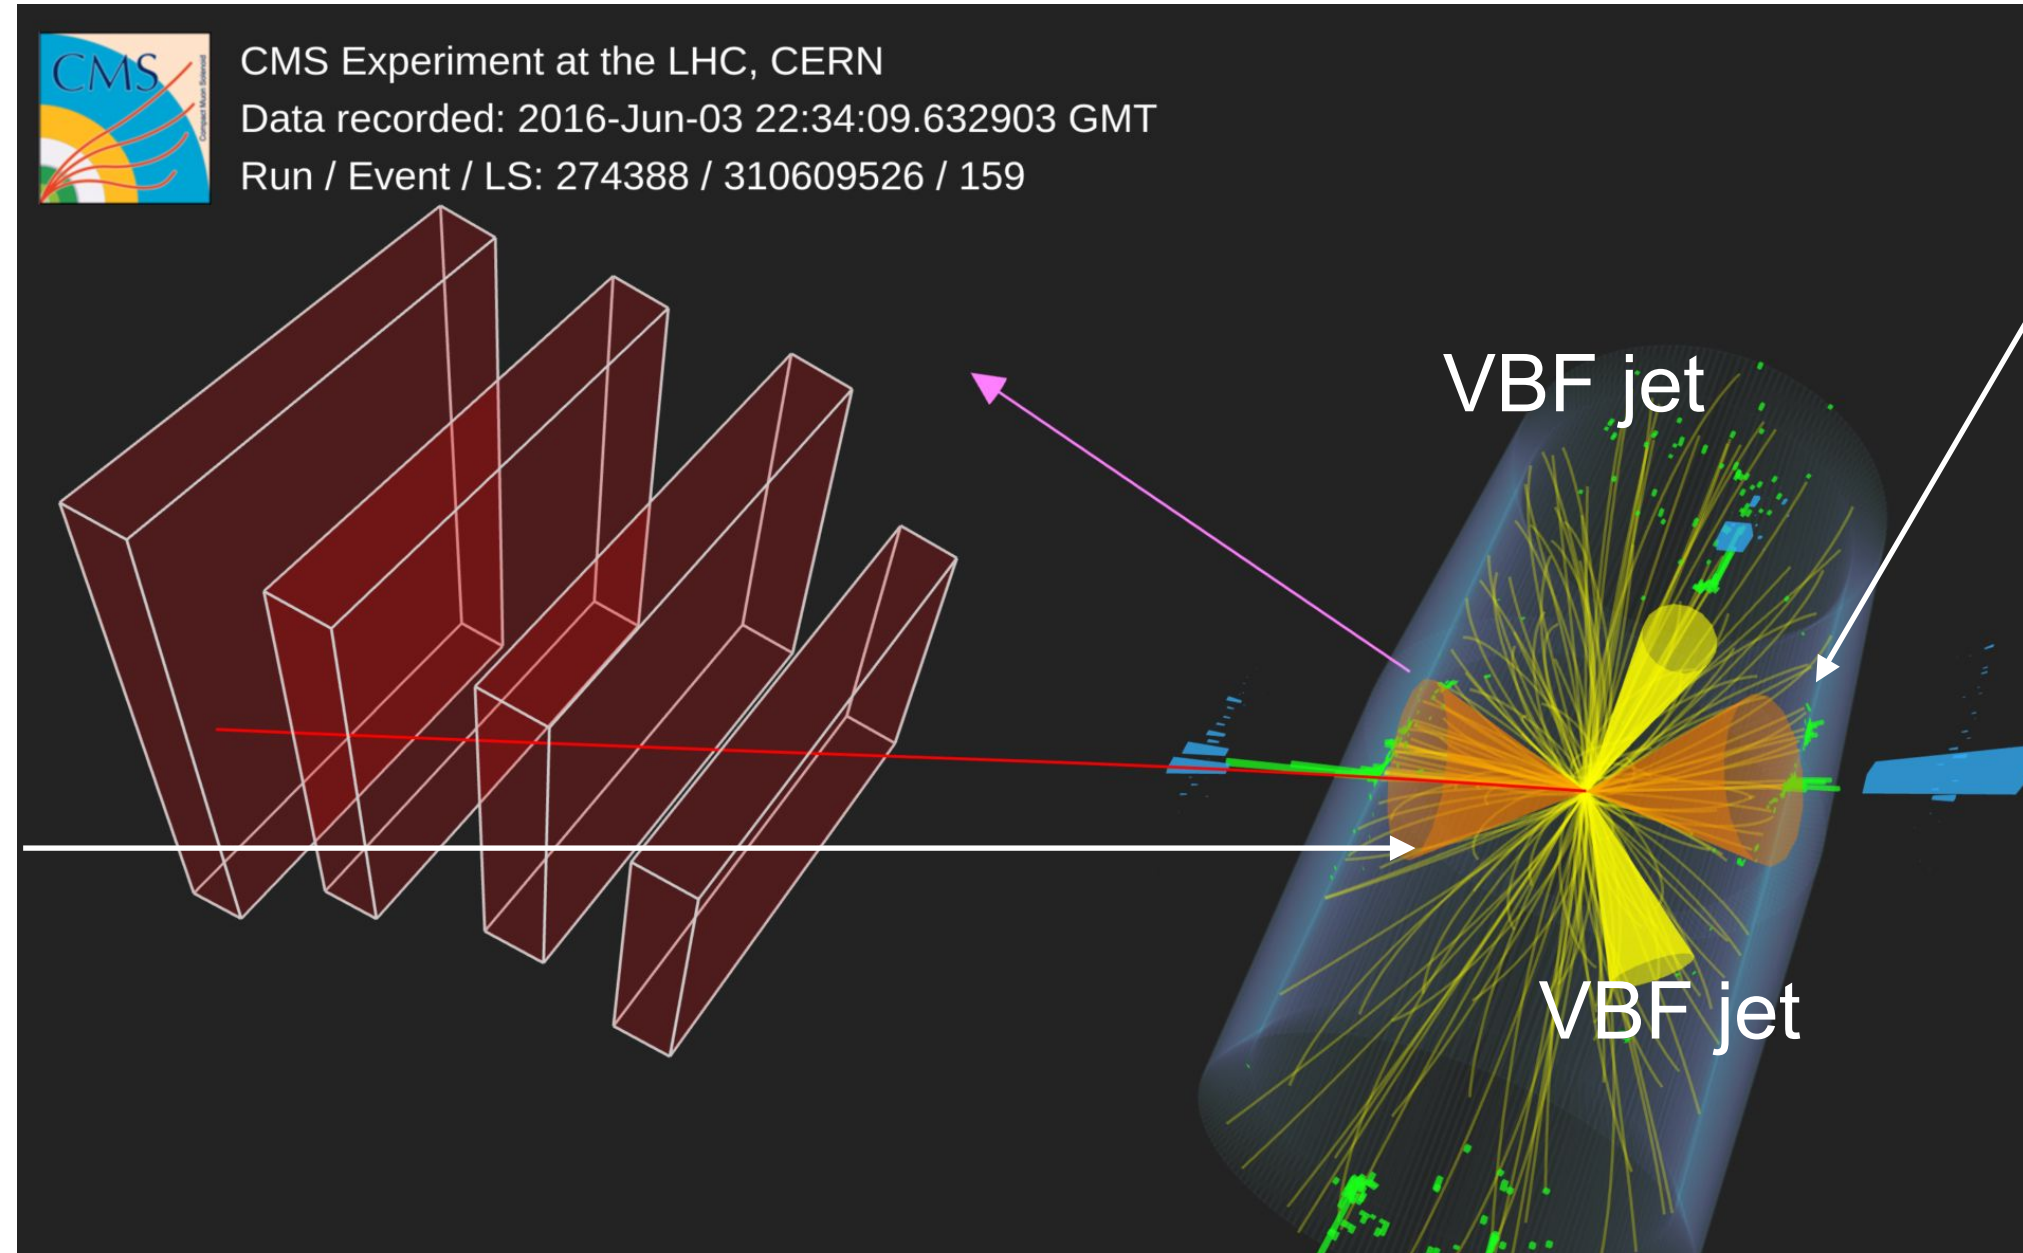

VV-tagged Jet

First use of ParticleTransformer.  
Identify **3 or 4 quarks inside a jet**:  
30% less efficient than bb

# HH (bb VV): tagging

- A “likely” VBF HH(bb VV) event:

## VV-tagged Jet

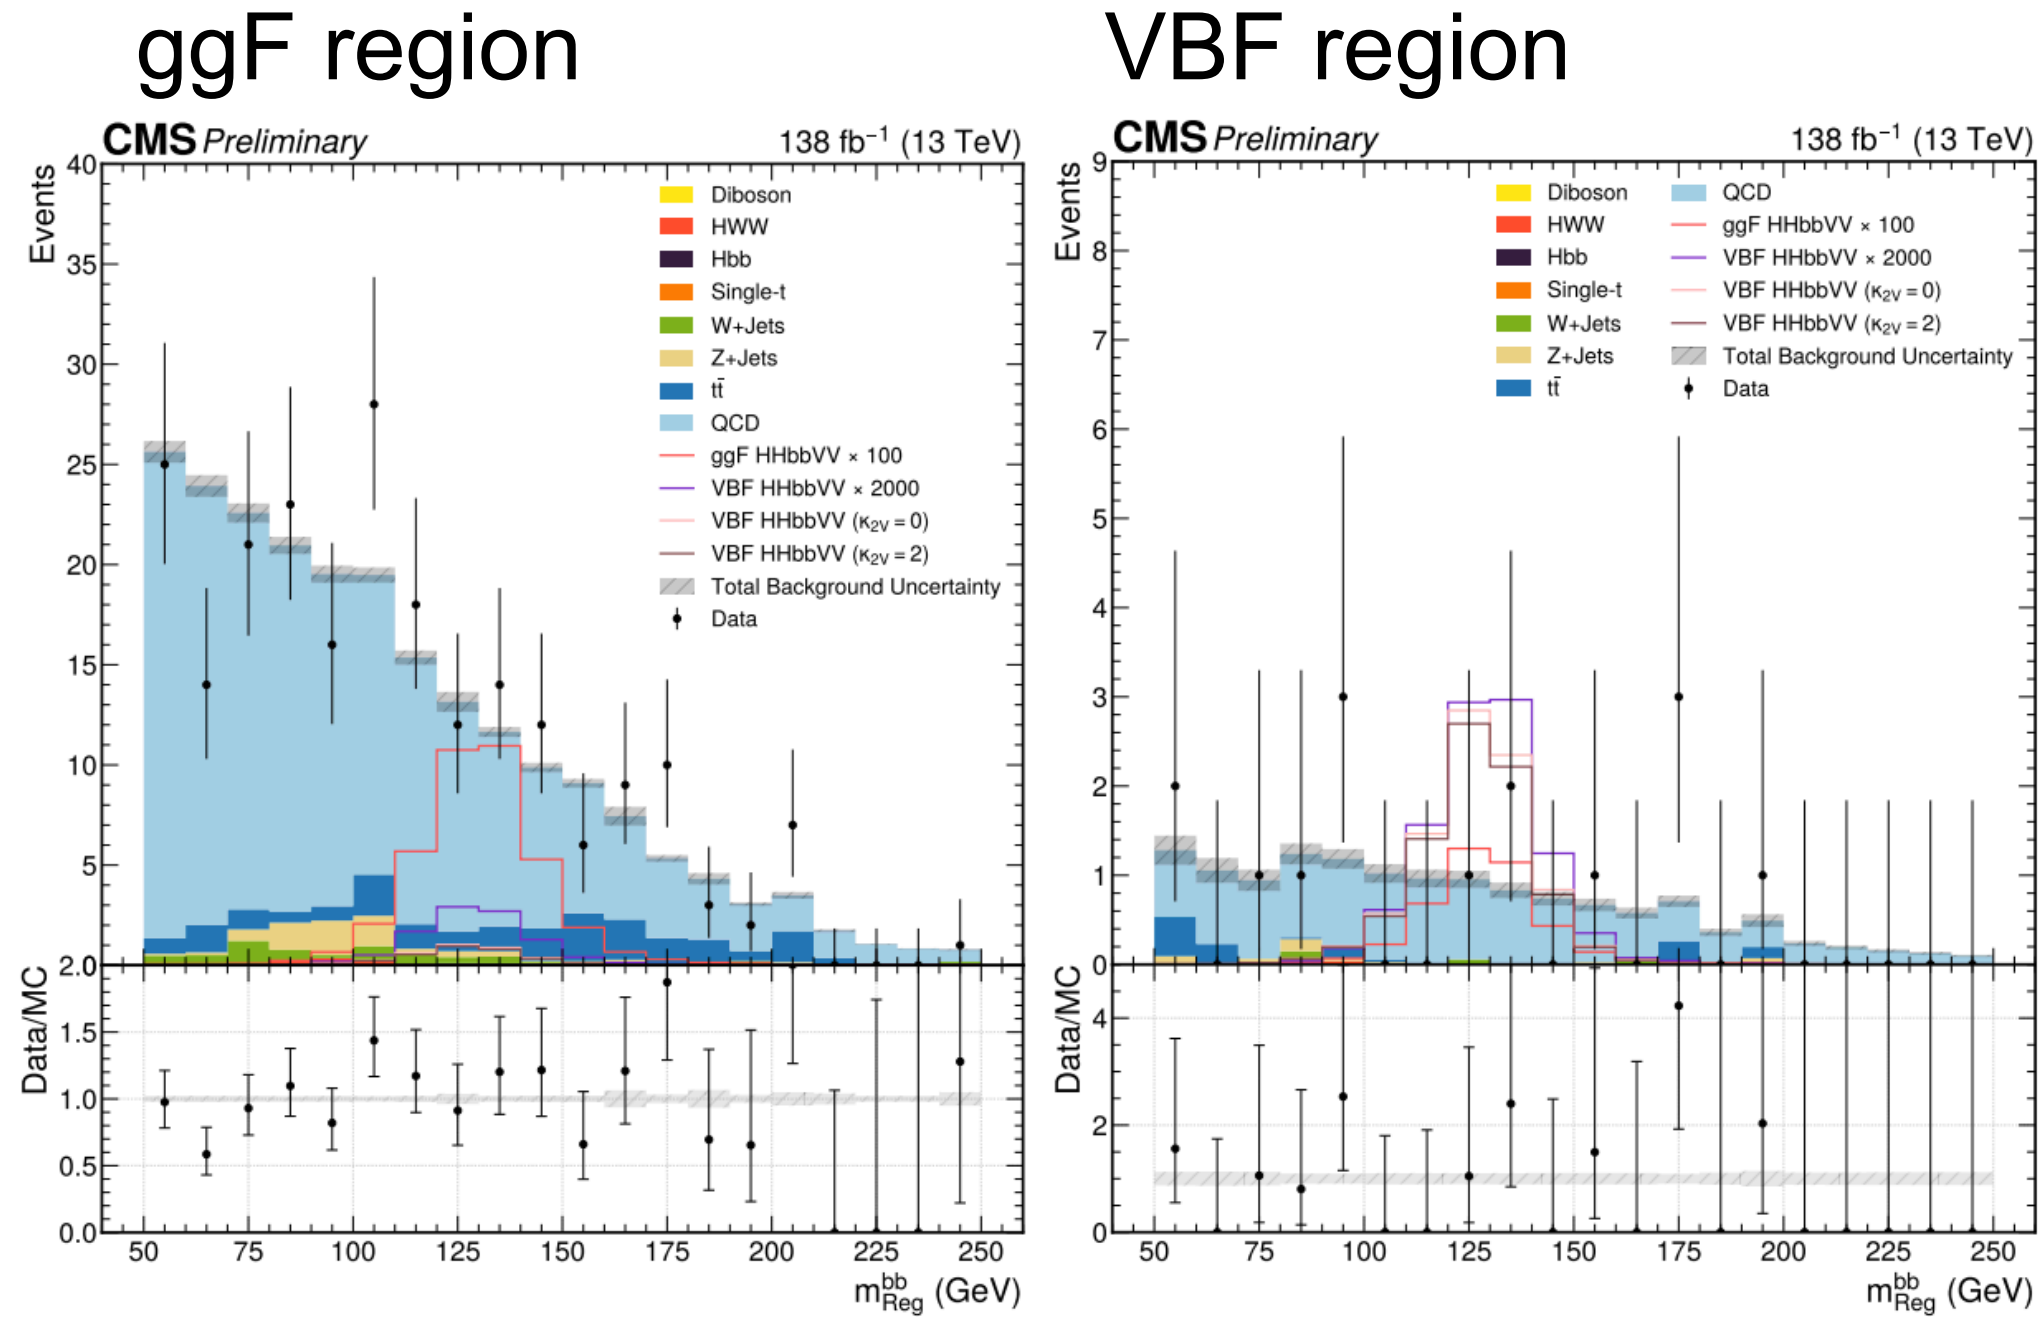

First use of [ParticleTransformer](#).  
Identify **3 or 4 quarks inside a jet**:  
30% less efficient than bb

## bb-tagged Jet

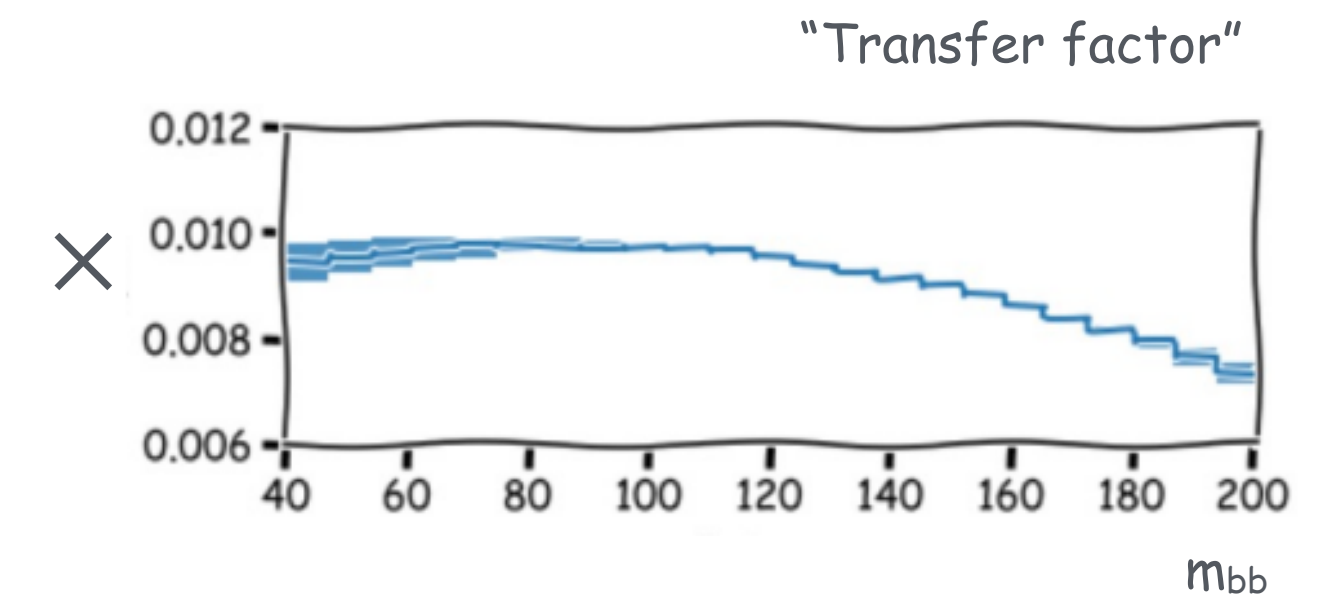

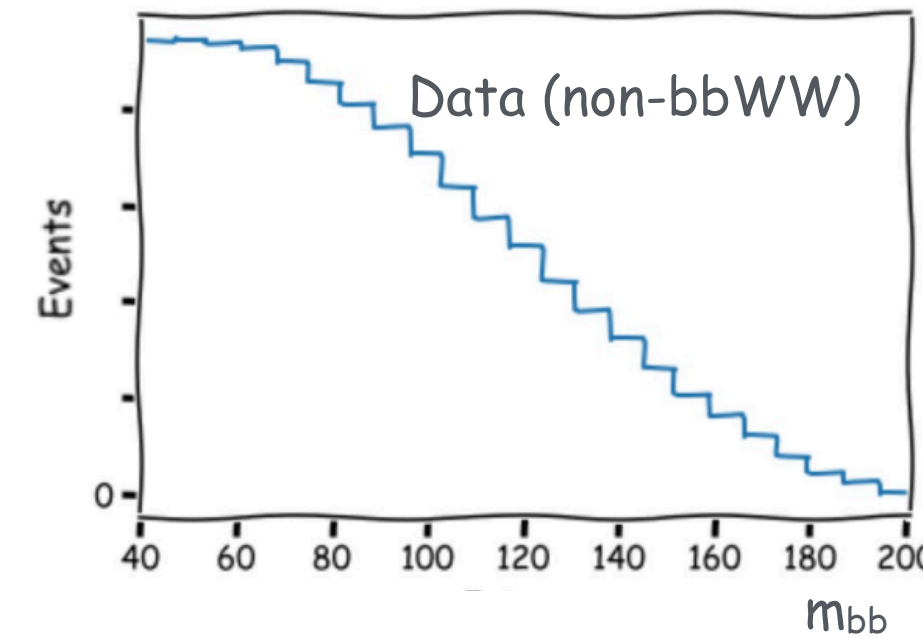

Extra challenge: **calibrate**  
signal efficiency **per subjet**  
(see [LundPlane poster](#))

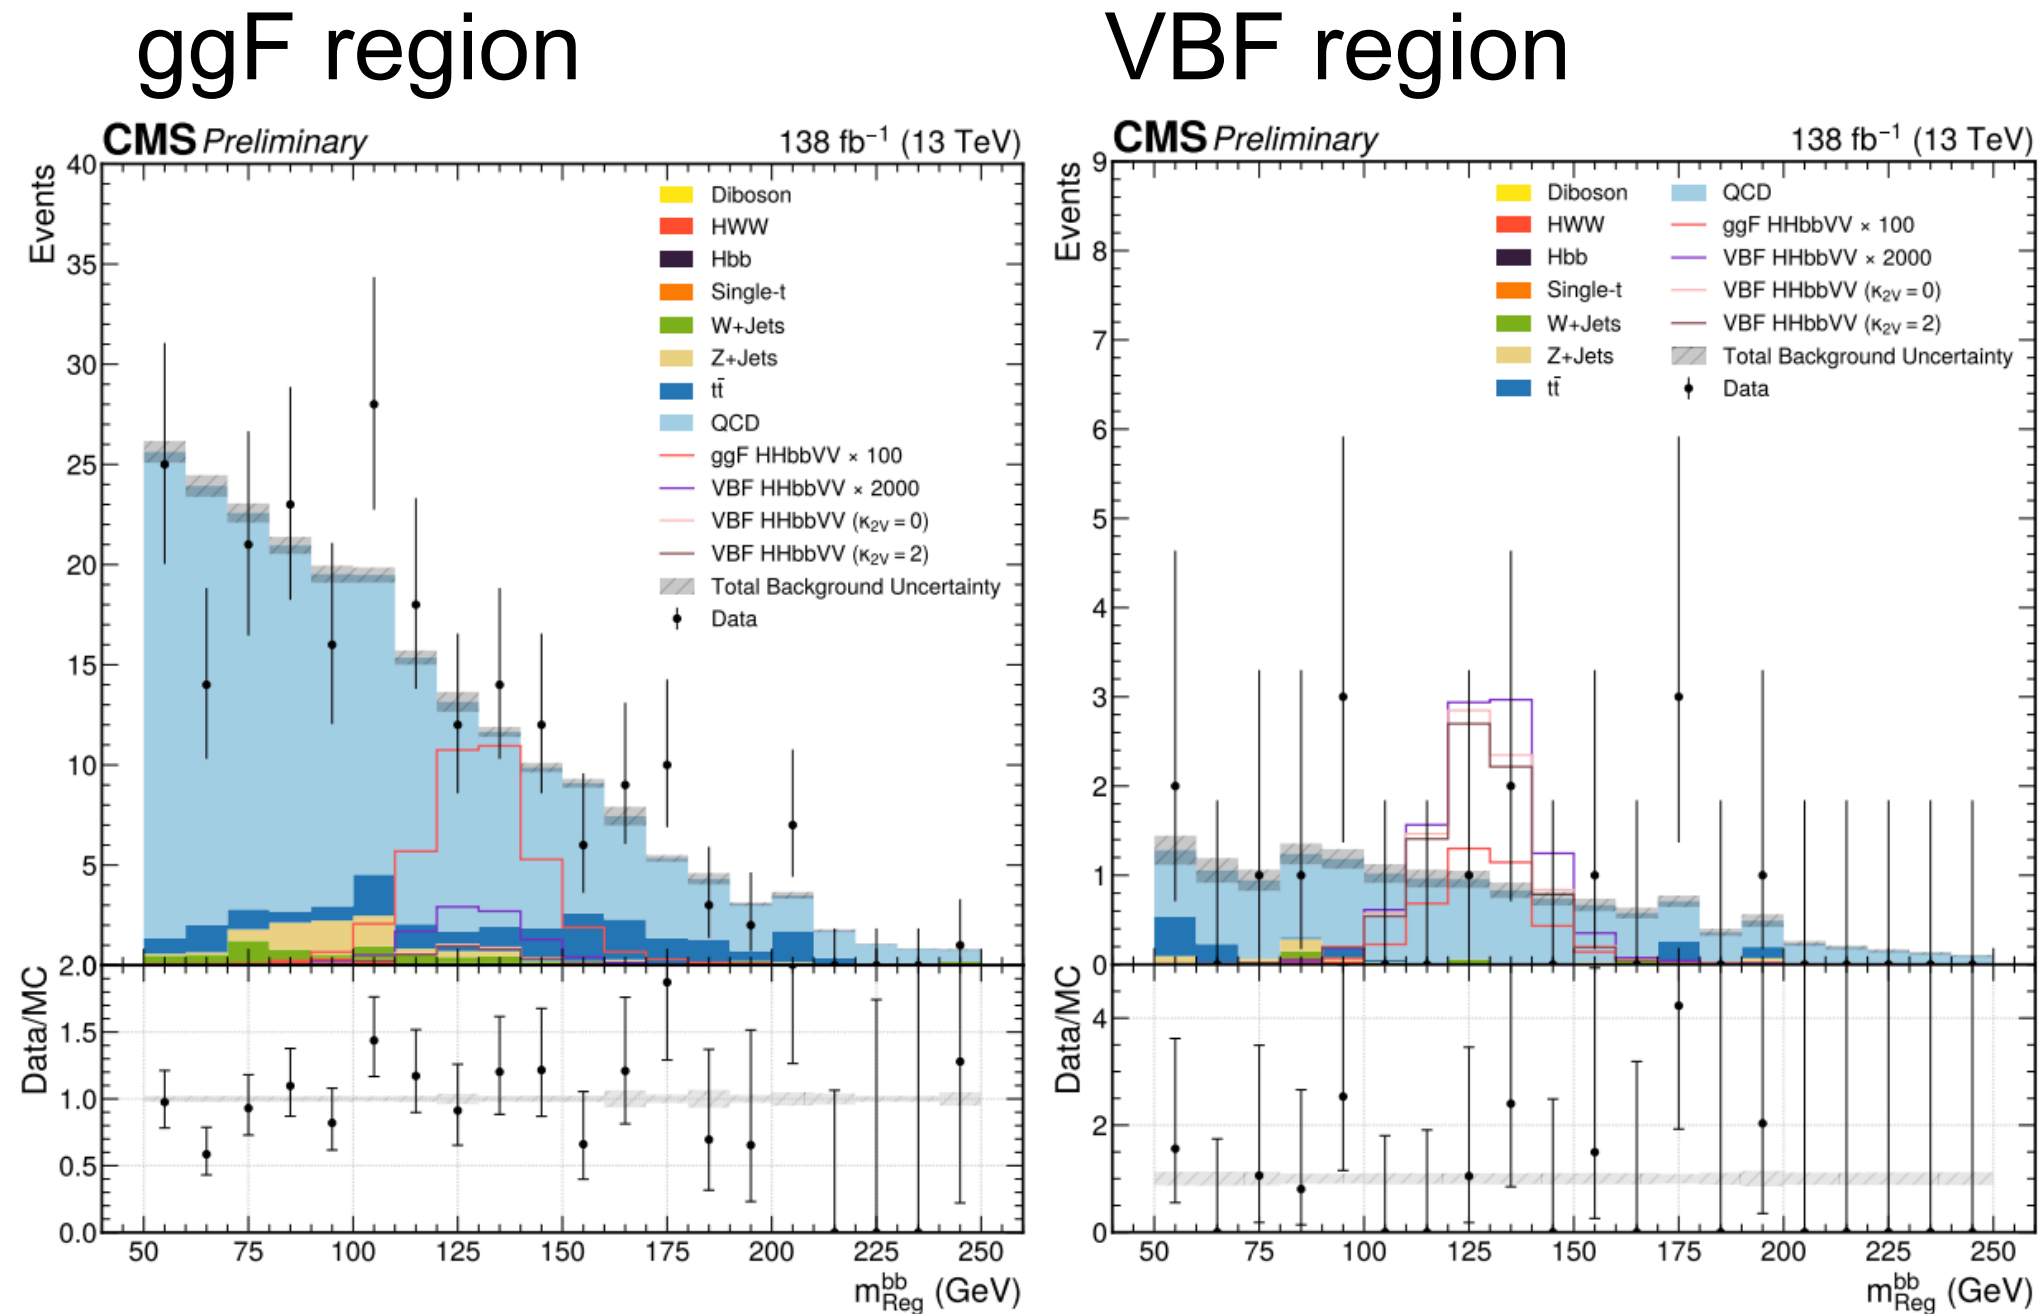

# HH (bb VV): results

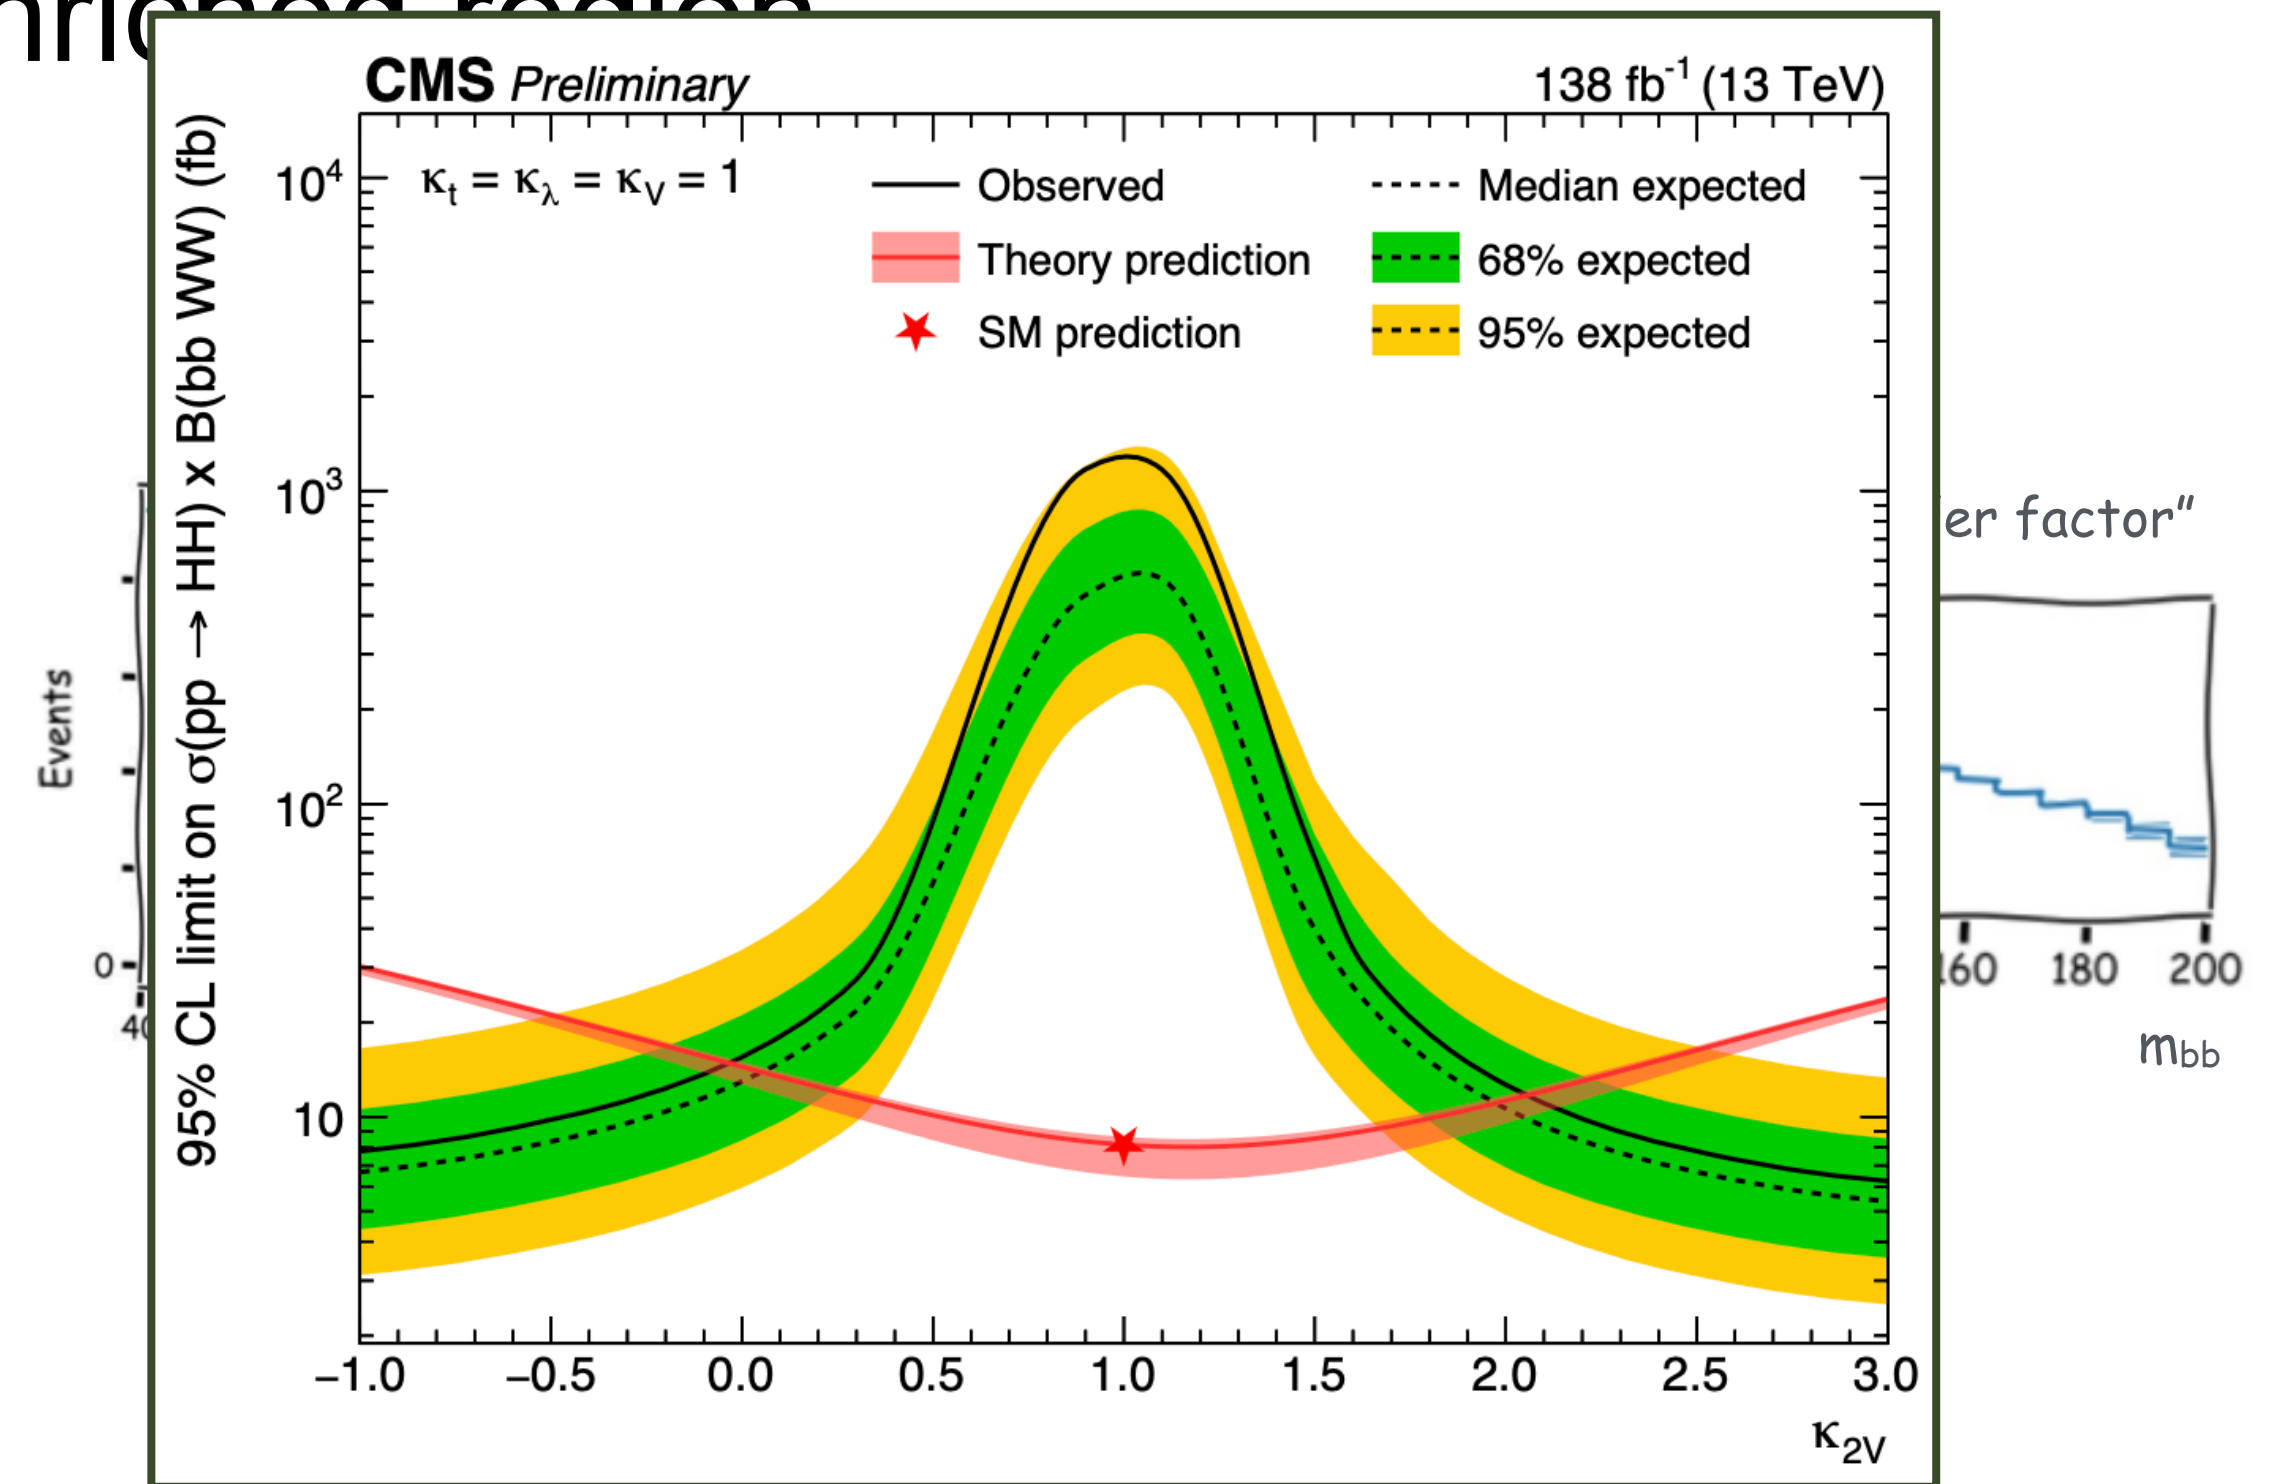

- Data-driven background
- Parametric “transfer factor” from QCD enriched region

# HH (bb VV): results

- Data-driven background
- Parametric “transfer factor” from QCD enriched region

- No relevant constraint to  $\kappa_\lambda$
- SM HH cross section  $< (69)142 \times$  SM
- But, powerful constraint on  $\kappa_{2V}$

$$\kappa_{2V} \in [-0.04, 2.05]$$

# The imminent “future”: Run-3

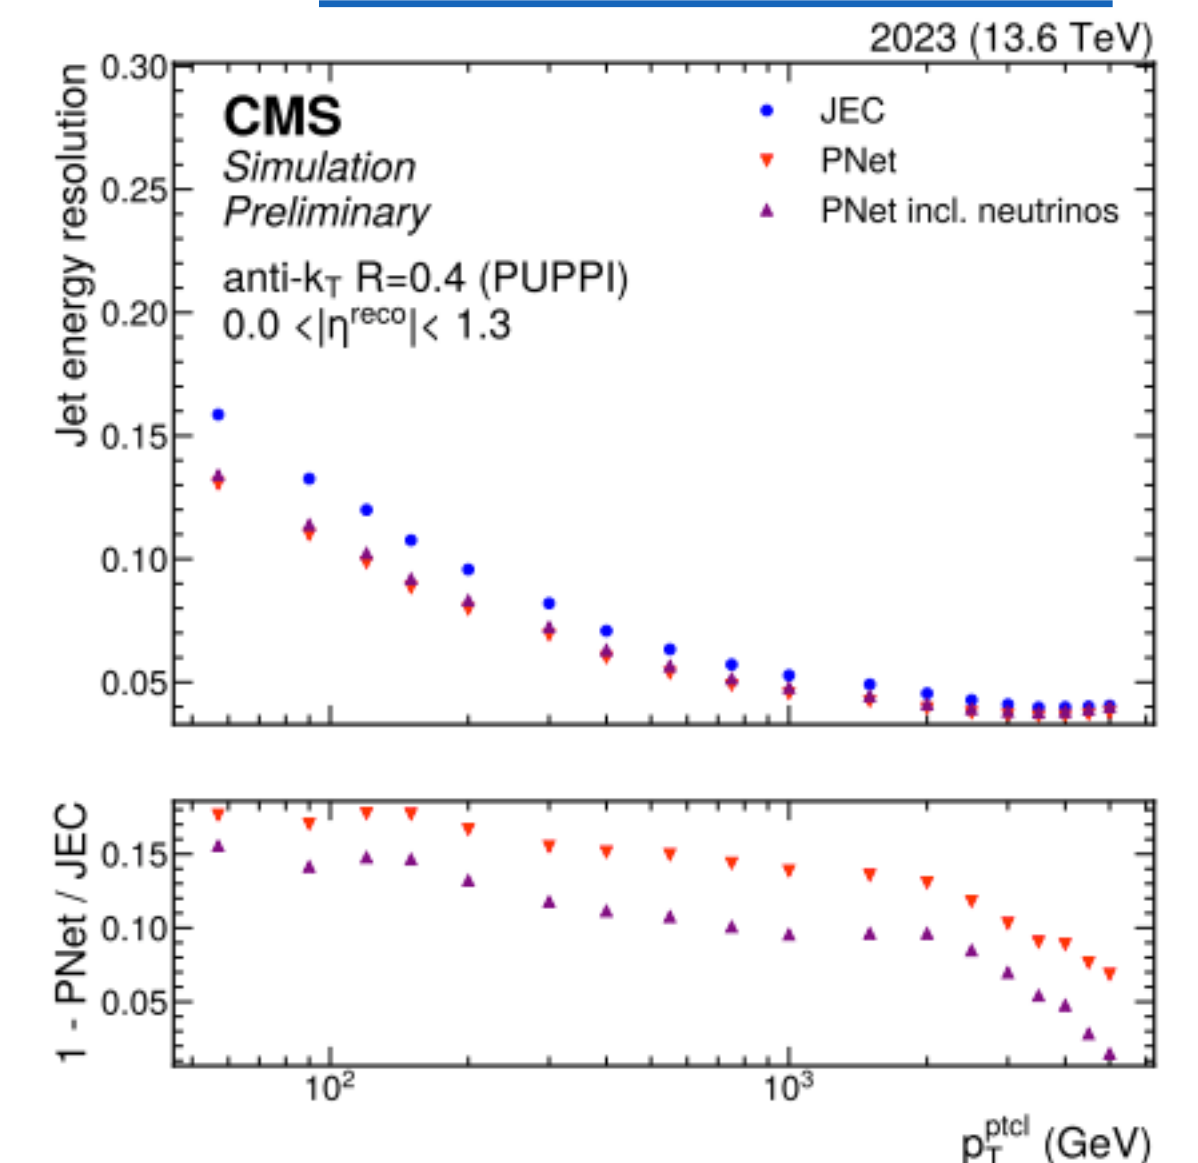

## Trigger improvements:

ML in trigger: ParticleNet, DeepTau  
 Added data streams (“Parking”)

Lower  $p_T$  threshold for  $bbbb$ ,  $bb\tau\tau$

[CMS-DP-2024-064](#)

## Reconstruction improvements:

Jet  $p_T$  regression with ParticleNet

improves response resolution by  $\sim 15\%$  (after calibration)

Improvements applicable for other  $bbXX$  channels (e.g.  $bb\gamma\gamma$ ,  $bbVV$ )

# Summary

---

- Extensive study of HH production with Run-2 data
- Exploring “new” channels:
  - Less sensitive but potential in combination
  - Boosted regime: powerful constraints of  $k_{2V}$
- Measurement of  $\kappa_\lambda$  is a cornerstone of HL-LHC:
  - Well-established search channels
  - Critical to overcome limitations from hadronic triggers and reconstruction
- **Exciting prospects for Run-3, and 13.6 TeV data!**
