## LONG STORY SHORT

### • The LHCb Experiment:

- *Designed to investigate CP violation and indications of physics beyond SM*
- *Focused on flavour physics and precision measurements*
- *Requires outstanding vertex and tracking systems*
- *Recorded Integrated luminosity  $\approx 10 \text{ fb}^{-1}$  in LHC Runs 1 & 2*

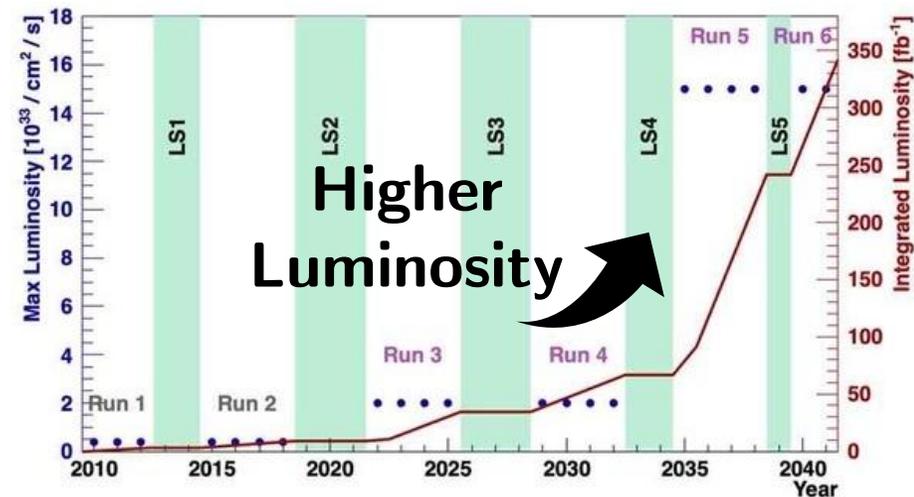

## »» THE LHCb EXPERIMENT

# Introduction: SciFi Tracker Motivation

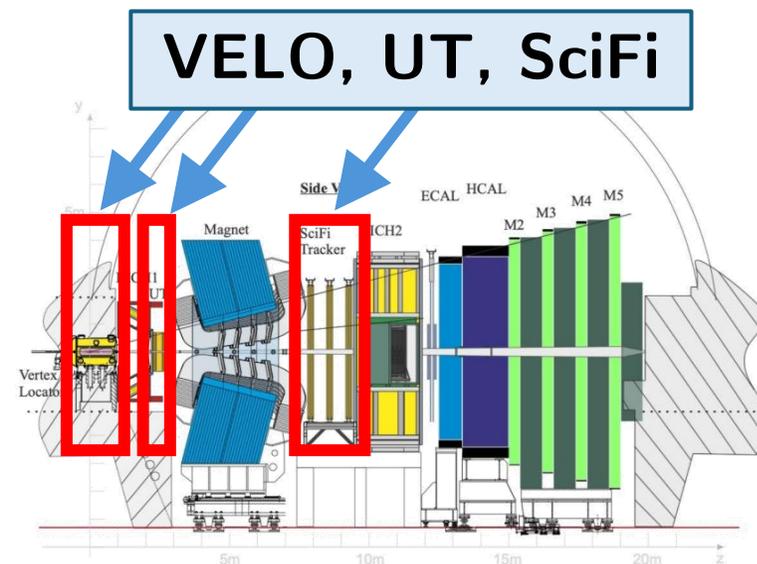

## LHCb UPGRADE I: A NEW ERA

- **LHCb UPGRADED** for LHC Runs 3 & 4

- $\approx 5x$  Run 2 instantaneous luminosity:
- Further improve Physics Research, but...
- ...to cope with increased luminosity...
- ...LHCb must deal with higher occupancy
- Substantial increase on readout rate:
- From Hardware to Software trigger (40MHz)

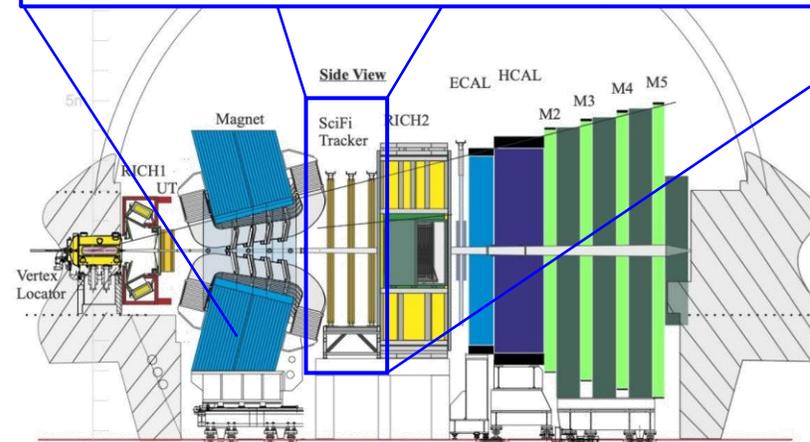

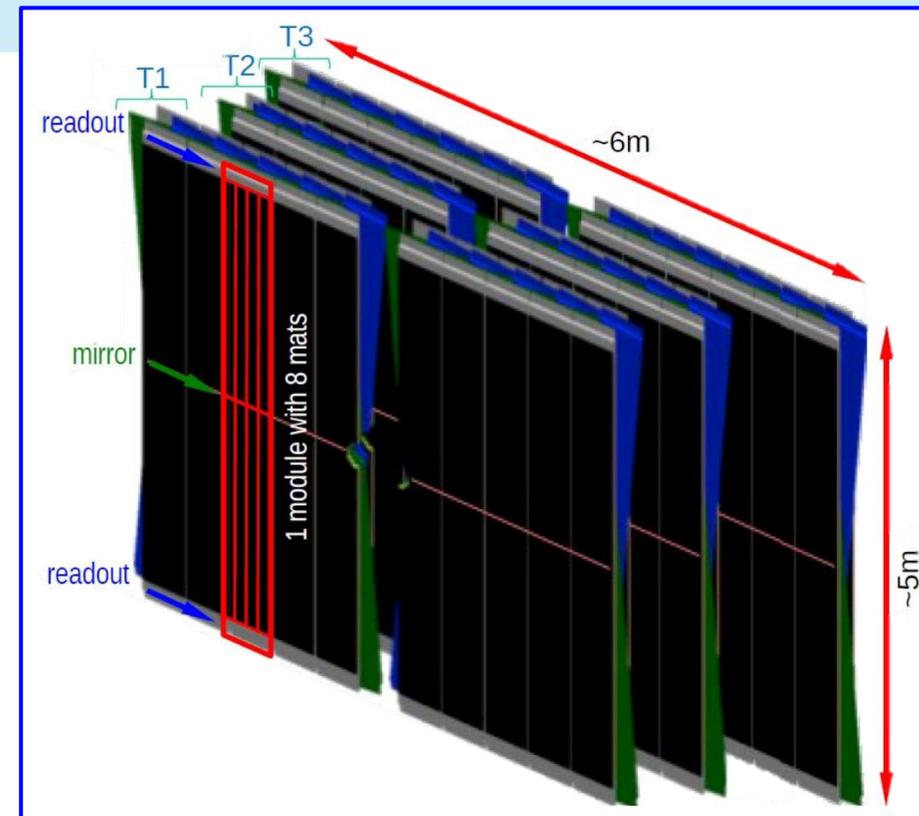

UPGRADED LHCb >>>

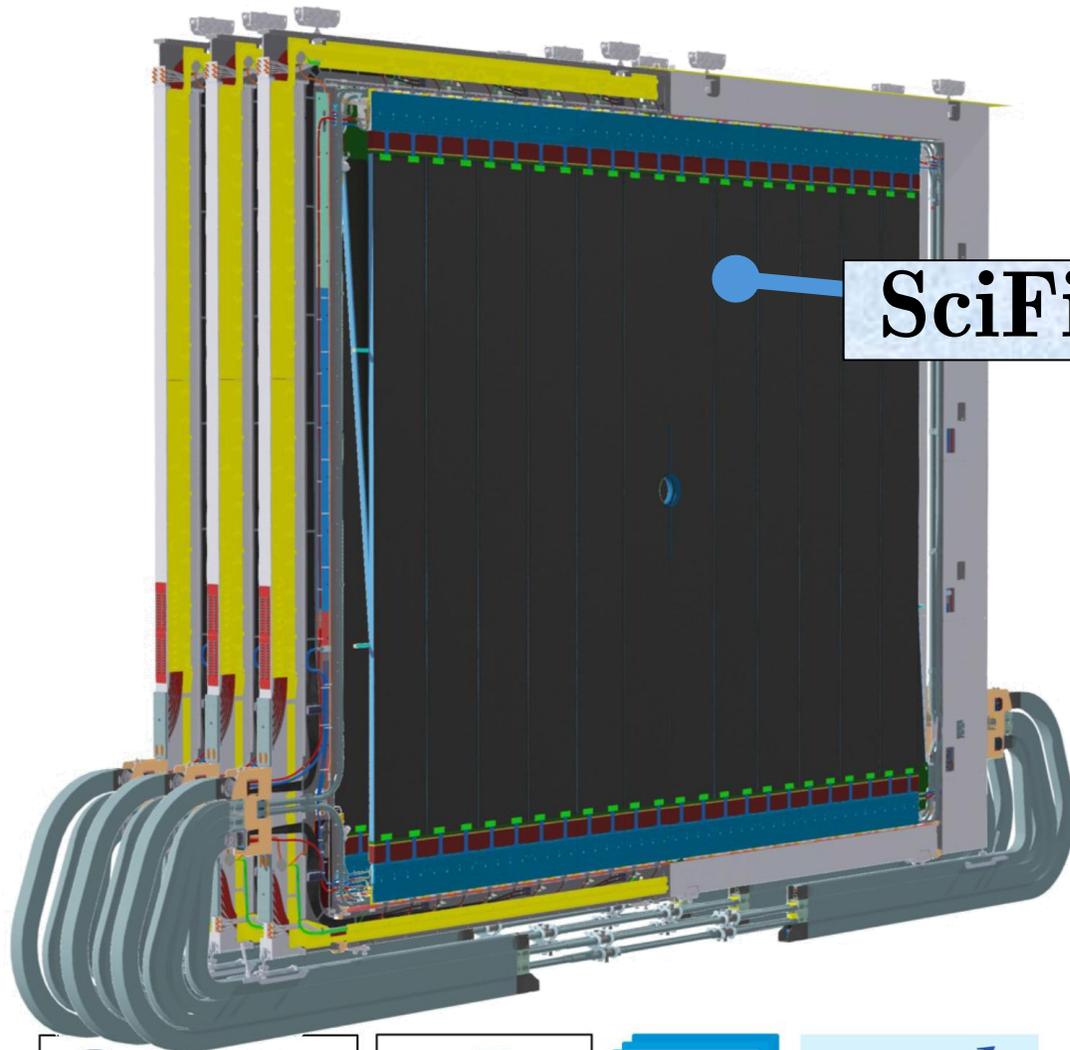

# The LHCb SciFi Tracker: Design Overview

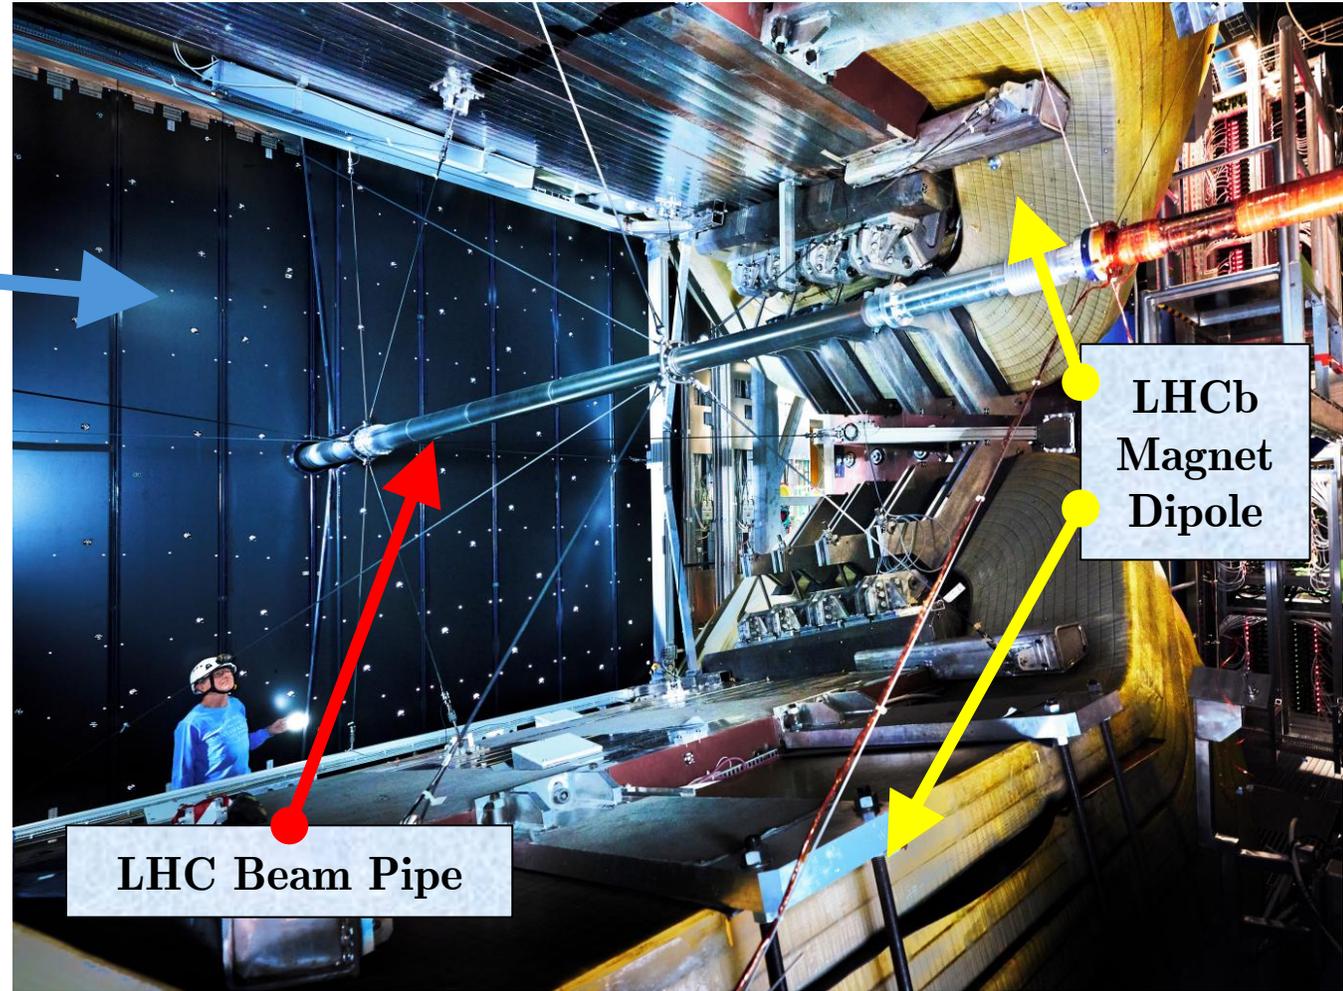

- **Large Instrumented Area:**
  - $3 \times 4$  Layers,  $340 \text{ m}^2$  active area
- **Outstanding Requirements:**
  - **High Tracking Performance:**
    - Hit detection efficiency  $> 99 \%$ ;
    - Spatial resolution  $< 100 \mu\text{m}$
  - **Low Material Budget:**
    - $\sim 1\% X_0$  per layer
  - **Challenging readout electronics:**
    - Very-high-density (Channel pitch =  $250 \mu\text{m}$ )
    - 524'288 SiPM channels among 256 FE-Boxes
    - Zero-suppressing algorithm in FPGA

# The SciFi Tracker in Details: Readout Principle

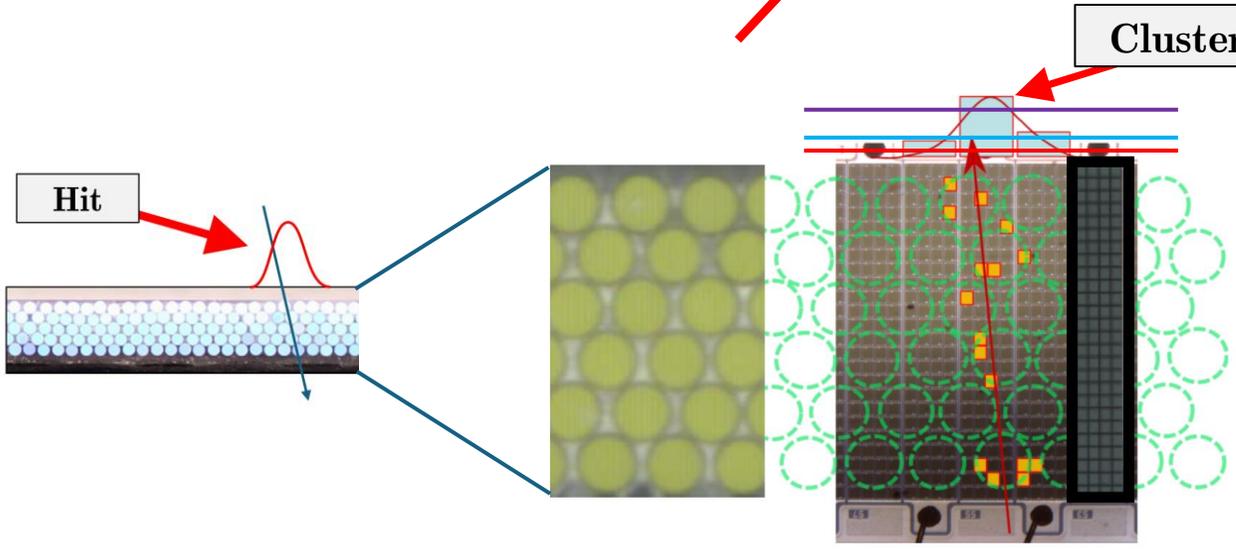

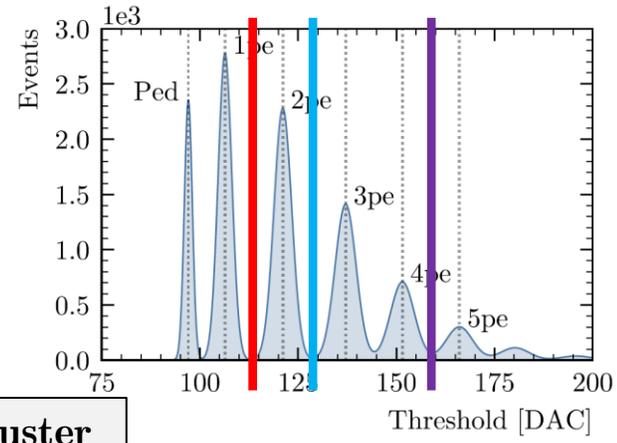

# The SciFi Tracker in Details: From ionizing particles to Hits

## PACIFIC - FEE 1<sup>st</sup> stage: SciFi readout ASIC

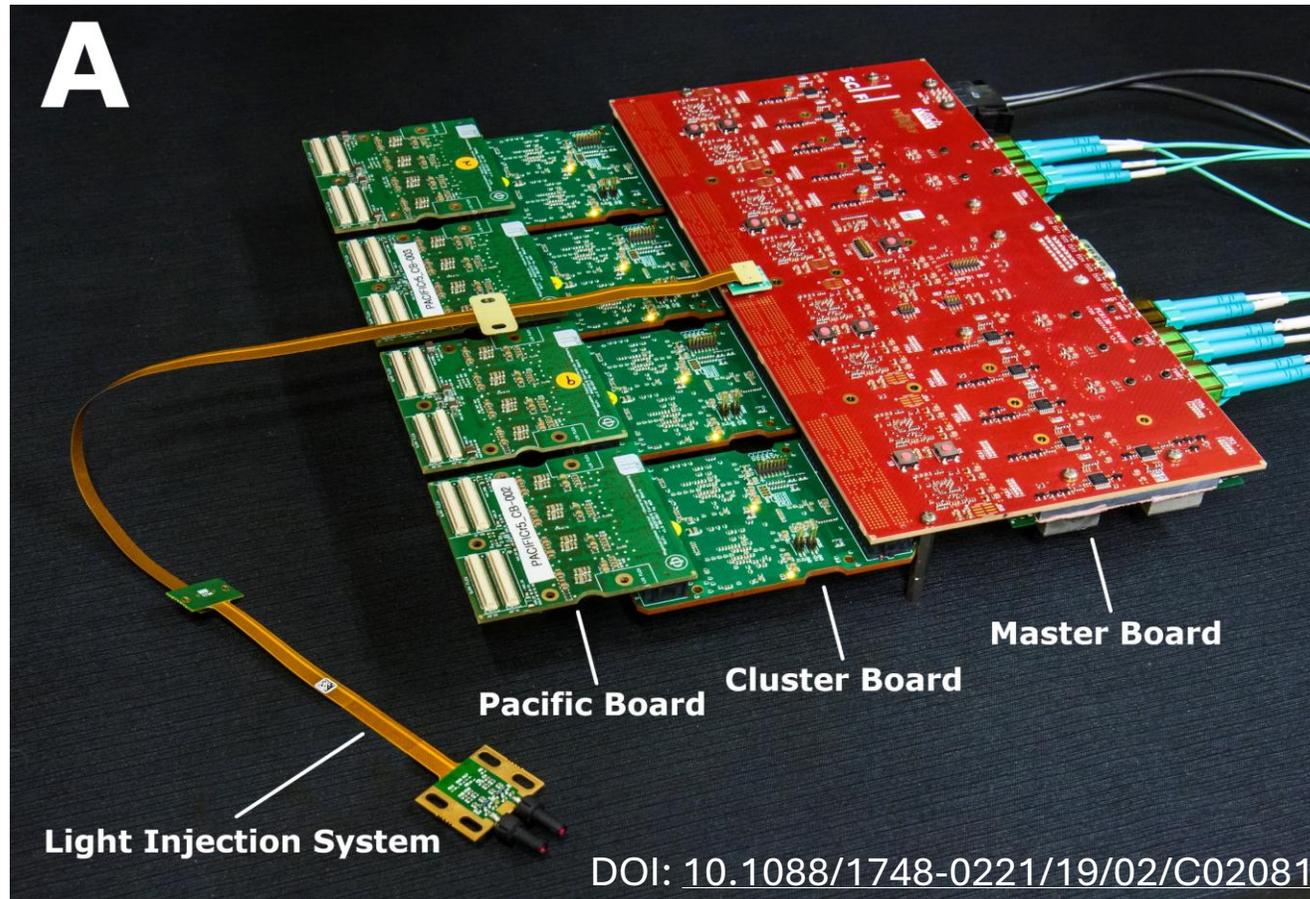

## Typical SiPM response

- Light**
  - A >MIP produce photons in scintillating fibers
- Signal**
  - Photons arrives at SiPMs and produce signals
- Cluster**
  - Signals are digitized and grouped into clusters
- Hit**
  - Clusters are decoded as hits on LHCb software
- Hit Eff.**
  - The ability to make the overall process happen

# The SciFi Tracker in Details: Front-End (on-detector) Electronics

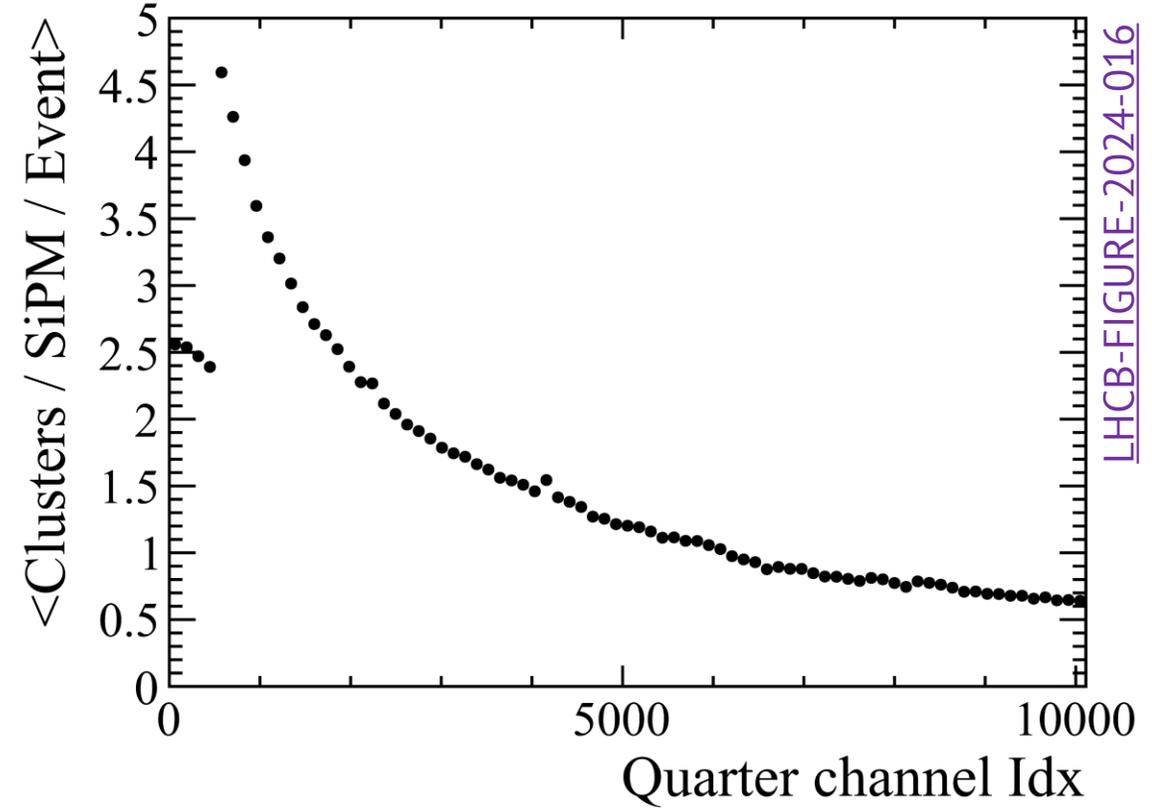

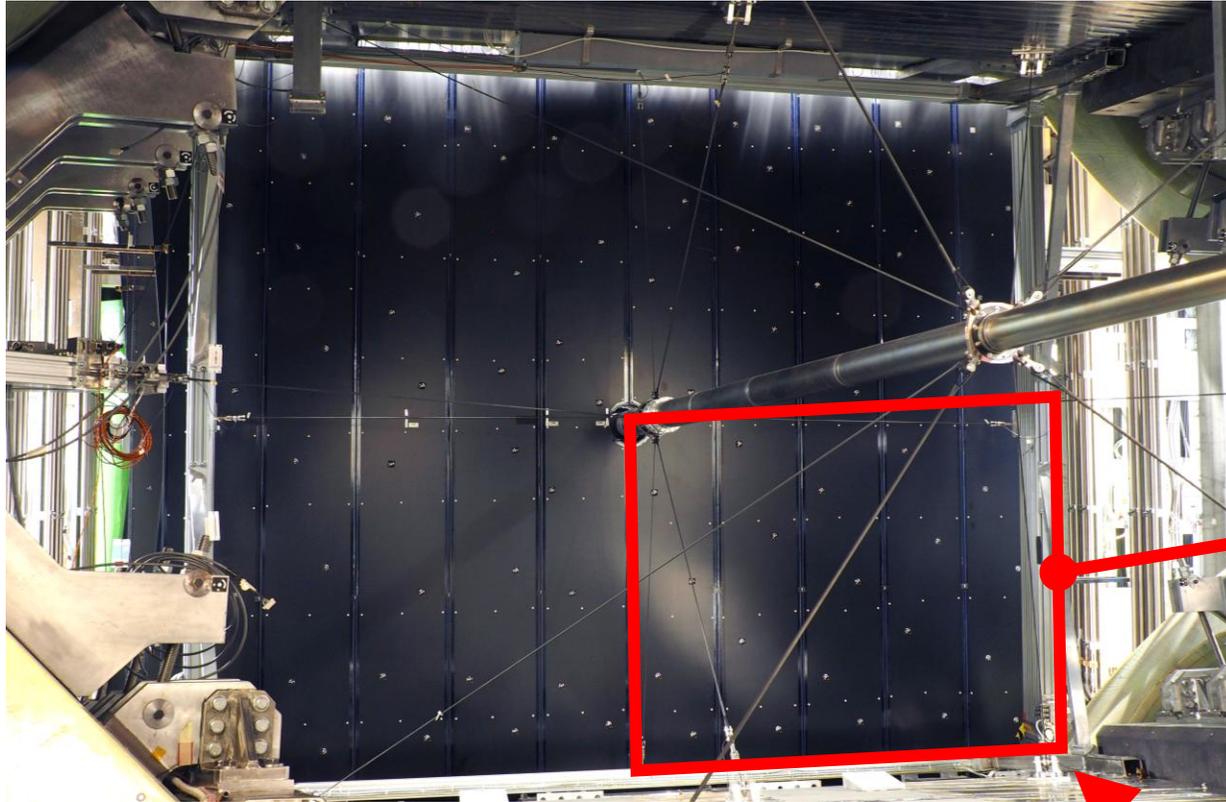

*“Small” remark:*

Entire SciFi has 4096 data links  
at 4.8 Gbps each: **19.7 Tbps**  
(40 MHz trigger-less readout)

*A lot of data !  
Even after zero-suppression*

SciFi has  $4096 \times 128$  channel SiPM Arrays

# Conclusions

**LHCb SciFi Tracker:** The largest of its kind ever built  $\Rightarrow 340 m^2$  |  $> 520 k$  channels

**Successfully installed in the LHCb detector:** Taking physics data since 2022

**Commissioning** A huge enterprise! Tons of software & dedicated tools

**& Calibration:** More than half million channels to calibrate (See Zehua's talk: 16h45)

29k7 sub-nanosecond clock lanes to be fine-tuned

**Performing well within specifications:** A few data links off ( $\sim 1\%$ ) to be fixed next TS  
(as earlier presented by Giulia) Hit efficiency  $> 99\%$  in most of the SciFi area

**Looking forward to Upgrade-II** (as presented by Renato)

➡ **Also:** Don't miss "The LHCb Mighty Tracker" Tai-Hua' poster

Thank you !

# Backup Slides

# The SciFi Tracker in Details: Modules (Scintillating Fibre Mats)

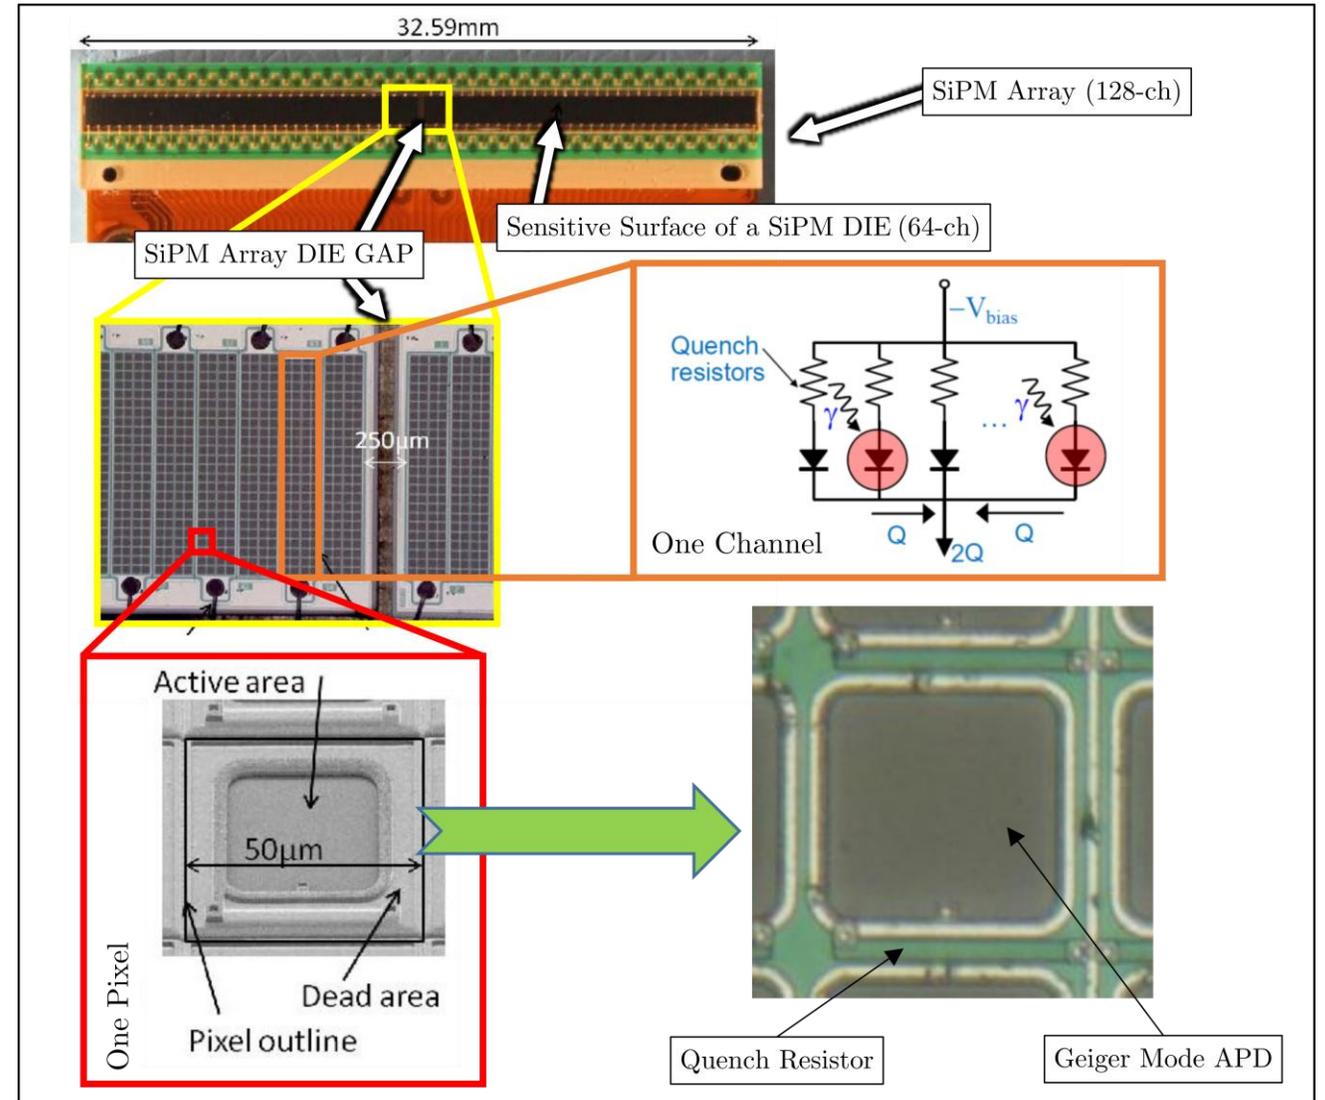

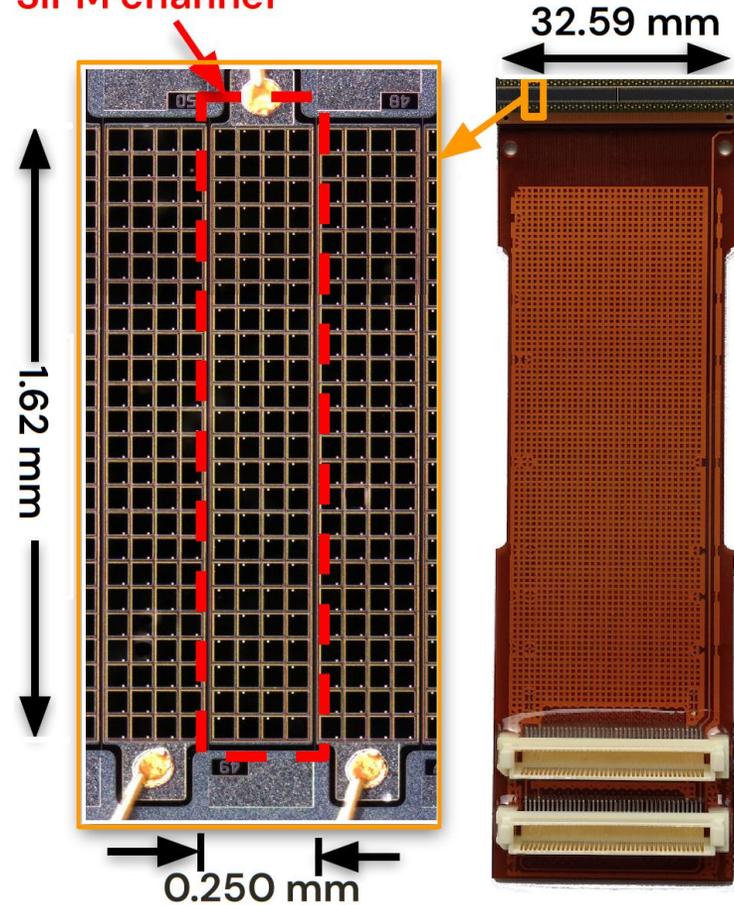

DOI: [10.1088/1748-0221/10/08/C08005](https://doi.org/10.1088/1748-0221/10/08/C08005)

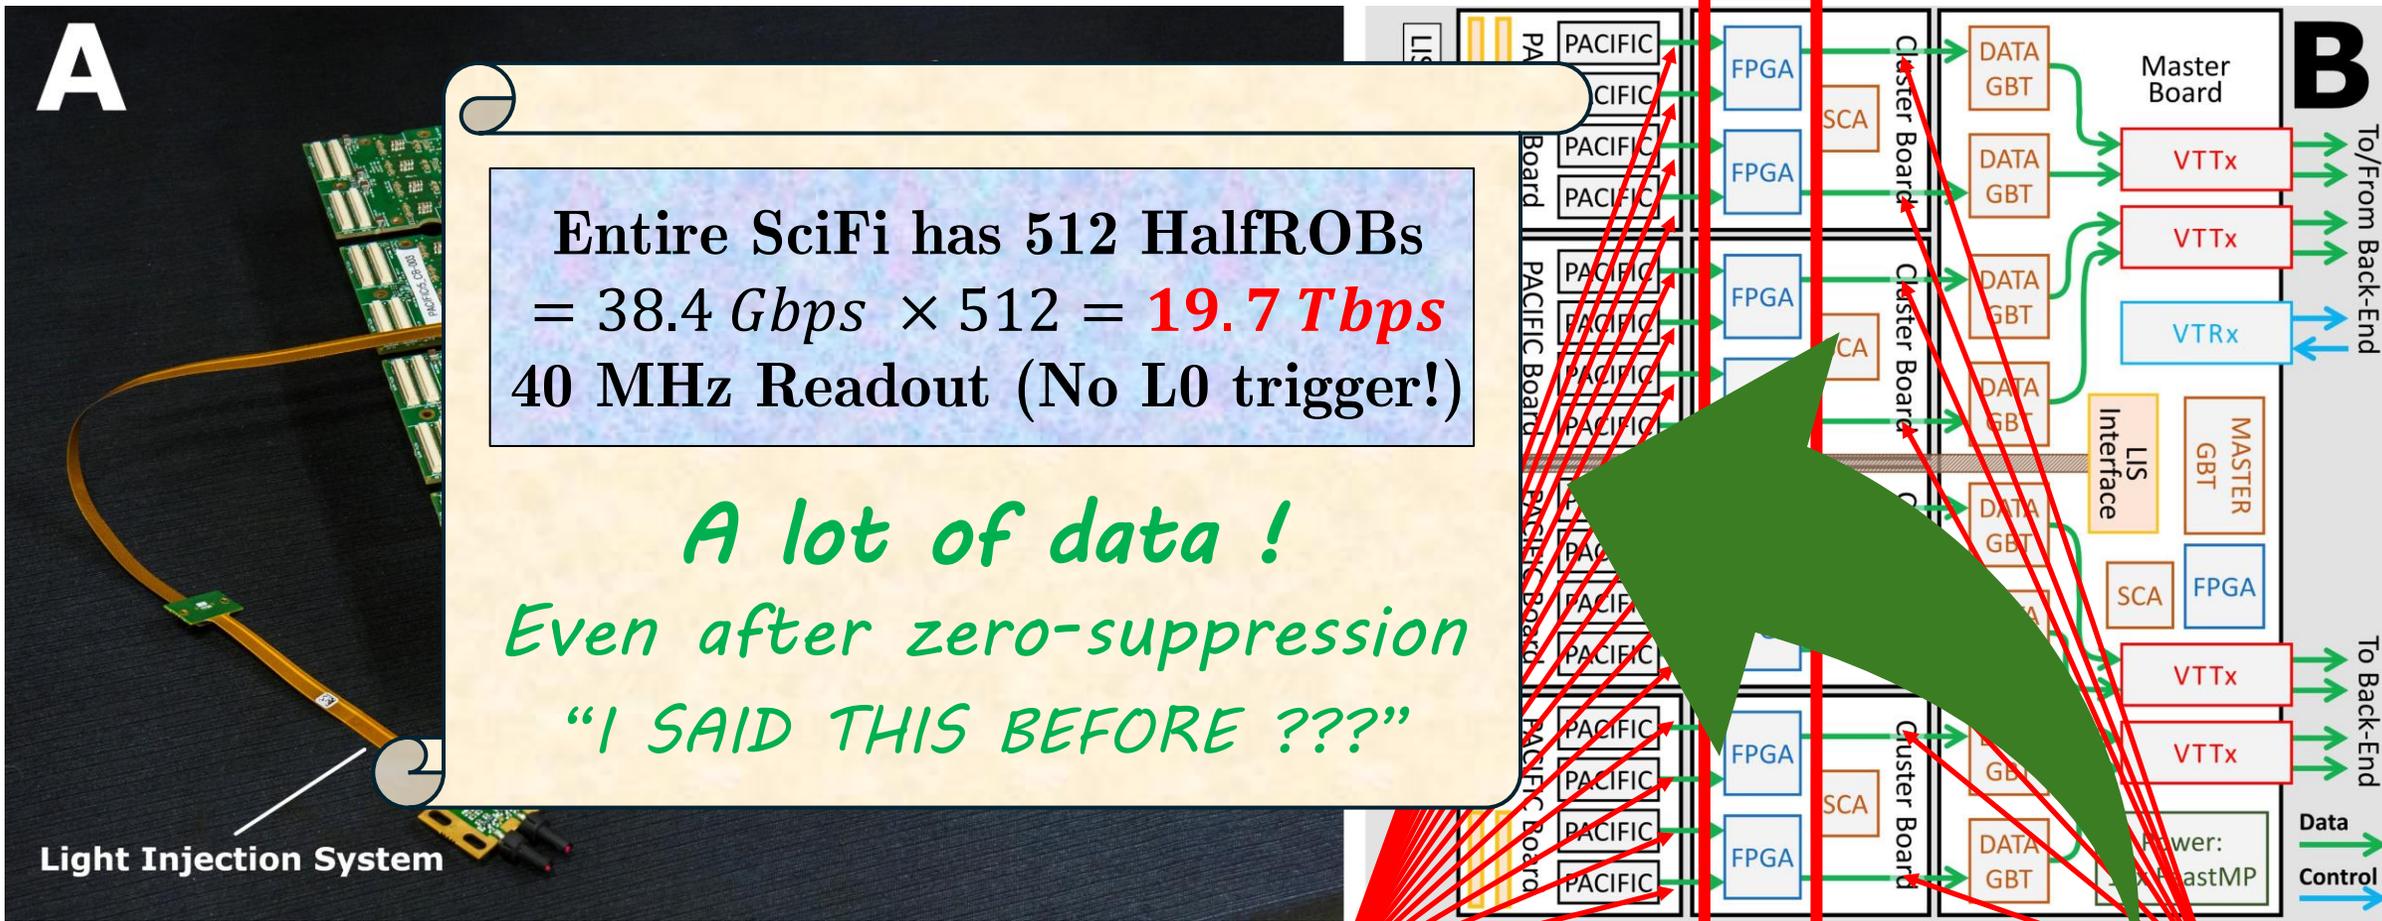

# The SciFi Tracker in Details: SiPM's (Silicon Photo-Multipliers)

## Silicon Photomultipliers (SiPM)

SiPM channel

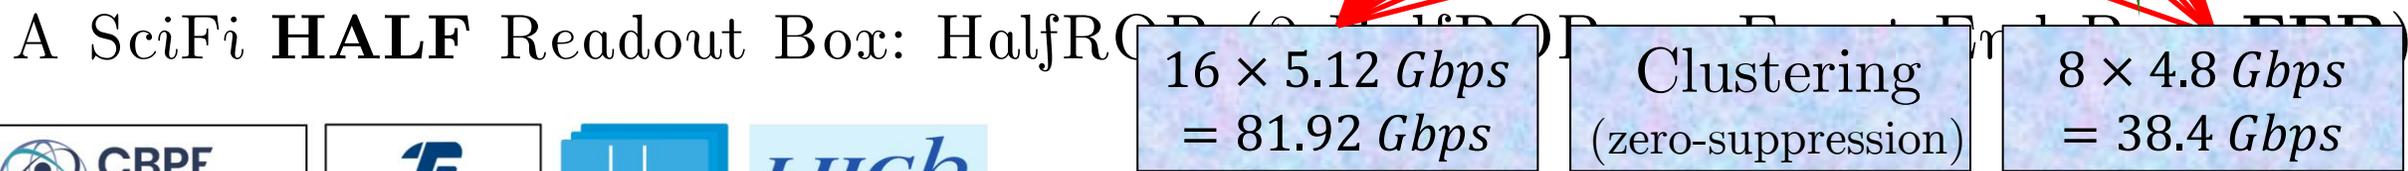

# The SciFi Tracker in Details: Front-End (on-detector) Electronics

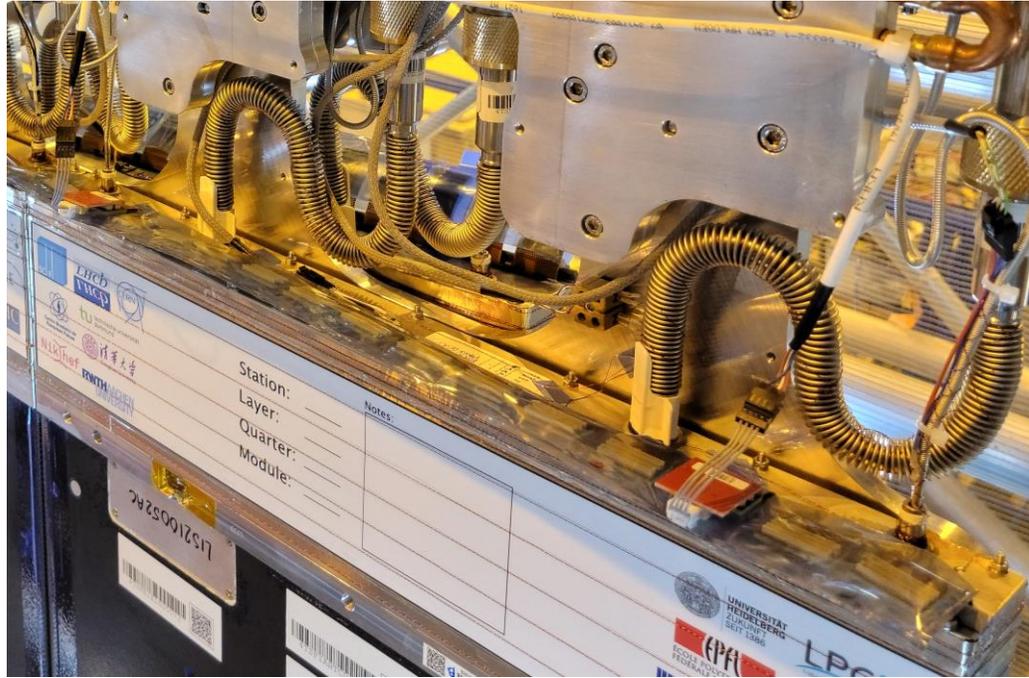

Entire SciFi has 512 HalfROBs  
 =  $38.4 \text{ Gbps} \times 512 = 19.7 \text{ Tbps}$   
 40 MHz Readout (No L0 trigger!)

*A lot of data !  
 Even after zero-suppression  
 "I SAID THIS BEFORE ???"*

# The SciFi Tracker in Details: **Services**

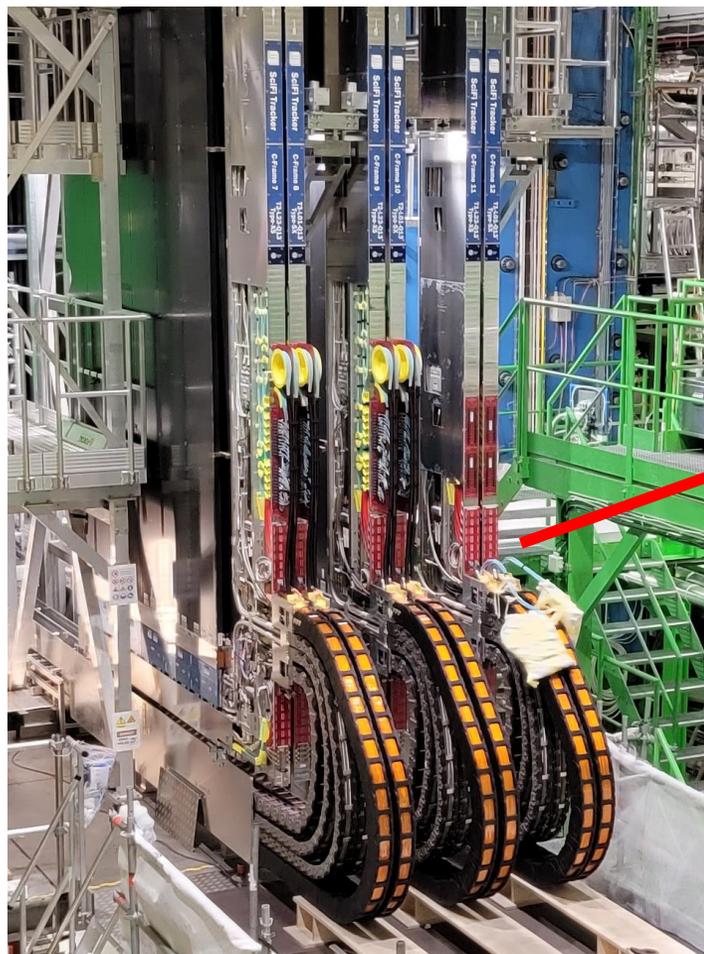

- **SiPM' cooling posed a great engineering challenge**

- *-40°C coolant flushing through all the SiPM arrays*
- *Avoiding condensation required vacuum, dry gas, etc...*

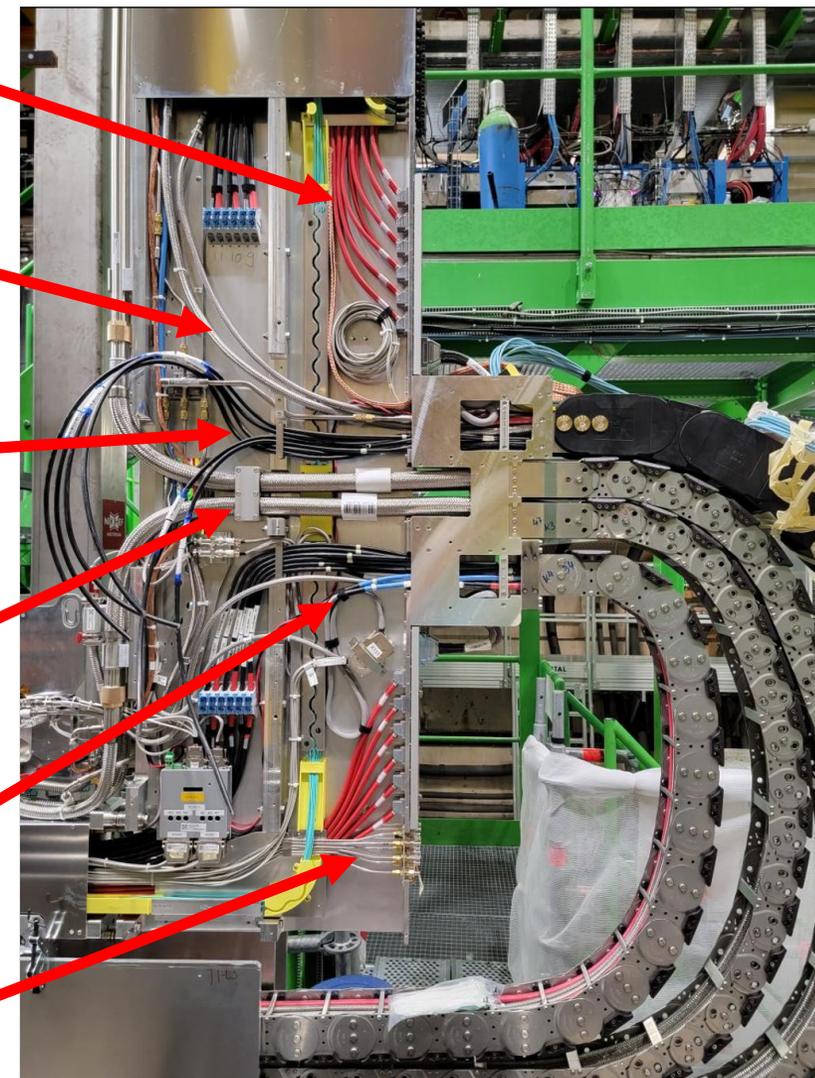

- **Of course, we also have:**

- *Low and High Voltage PSUs*
- *Monitoring, automation...*

# The SciFi Tracker in Details: Services

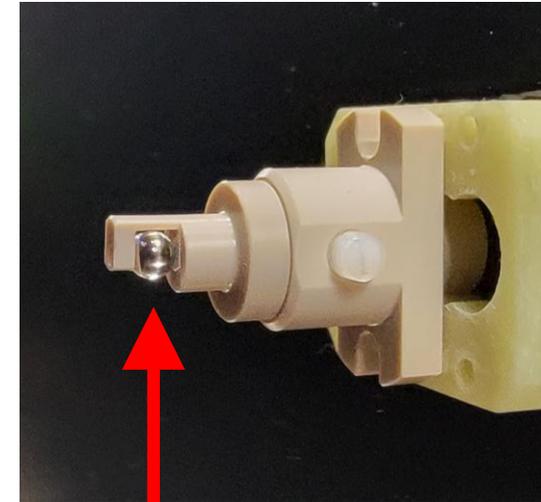

- High Voltage Cabling
- Water Cooling (for Electronics)
- Low Voltage Cabling
- Vacuum-Insulated Coolant (for SiPMs)
- Monitoring Cables (DSS)
- Dry Gas Pipes (Condensation Prev.)

# The SciFi Tracker in Details: BCAM System (Real-time geometry monitoring)

- **BCAM (Brandeis CCD Angle Monitor):**

- 24 cameras are installed under SciFi floor;
- 42 targets (glass balls) installed (glued) on the C-frames, on a special holder;
- Targets illuminated with 650 nm diode lasers and photographed by multiple cameras/angles;
- Detector's geometry is reconstructed from the measurements of relative angles;
- Tracks slightly moves due to, for example, changes on temperature and magnetic field.

**Targets**

**Lasers and Cameras  
(under the detector)**

## FOR LHCb UPGRADE II

### • Replacement of SciFi after LHC Run 4

- Radiation damages will require substantial replacement of components;
- Even higher instantaneous luminosity leads to even more multiplicity, and trace density poses a challenge to stereoscopic tracking;
- For the innermost area (the “hottest” one) Might Tracker will use Solid State (Silicon) pixel sensors;
