SND@LHC AND ADVSND

A ROADMAP FOR NEUTRINO DETECTION AT LHC AND HL-LHC

ICHEP

Prague, 20/07/2024

Giulia Paggi

INFN and Università di Bologna

On behalf of the SND@LHC Collaboration

Scattering and Neutrino Detector at the LHC [1]:

→ study $pp \rightarrow \nu X$ in a yet unexplored energy range

Identify **all flavours** at **TeV** energies allows for

→ Measure **charm production** at high η ($gg \rightarrow cc$)

→ Test lepton **flavour universality** measuring ν_e/ν_μ and ν_e/ν_τ

→ Direct search of **feebly-interacting particles**

Hybrid detector composed of:

→ Veto system: 3 planes of scintillating bars read by SiPMs

→ Target with vertex detector and electromagnetic calorimeter

→ Emulsion plates interleaved with tungsten (Emulsion cloud chamber)

→ scintillating fibers (SciFi) modules

→ Hadronic calorimeter and muon system: 5+3 scintillator planes read by SiPMs interleaved with iron

[1] SND@LHC collaboration, SND@LHC: The Scattering and Neutrino Detector at the LHC

A photograph of a server room with a person kneeling on the left side, looking at a server rack. The room is filled with rows of server racks, some of which are highlighted in green. The floor has a metal grate. The overall scene is dimly lit, with a blue tint at the top and bottom edges.

SND@LHC IN RUN 3

Istituto Nazionale di Fisica Nucleare
Sezione di Bologna

In the neutrino interactions from ν_μ analysis [2] the veto system's inefficiency [3][4] was such to require the use of the first two tracker planes to reach the necessary rejection power.

During 2023-2024 YETS added a third veto plane [5] with vertical instead of horizontal bars to

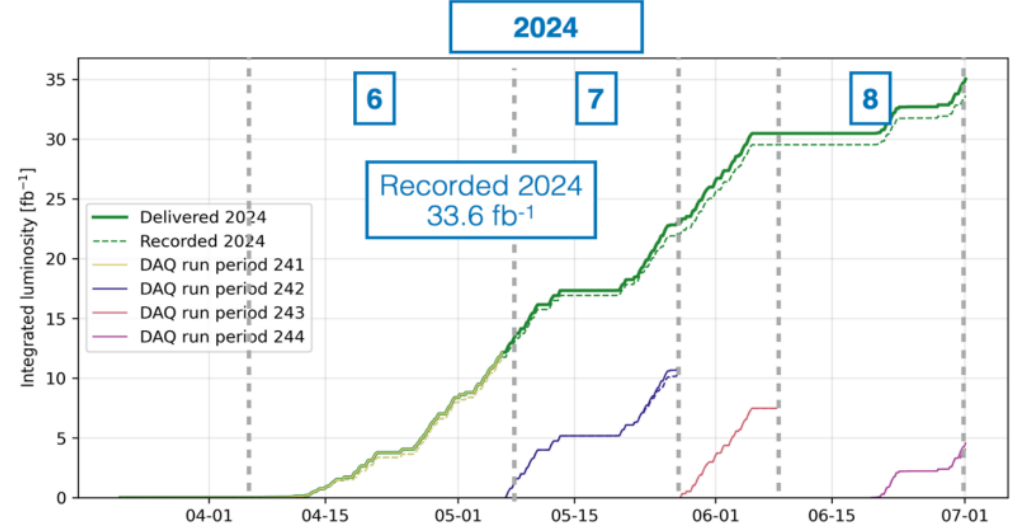

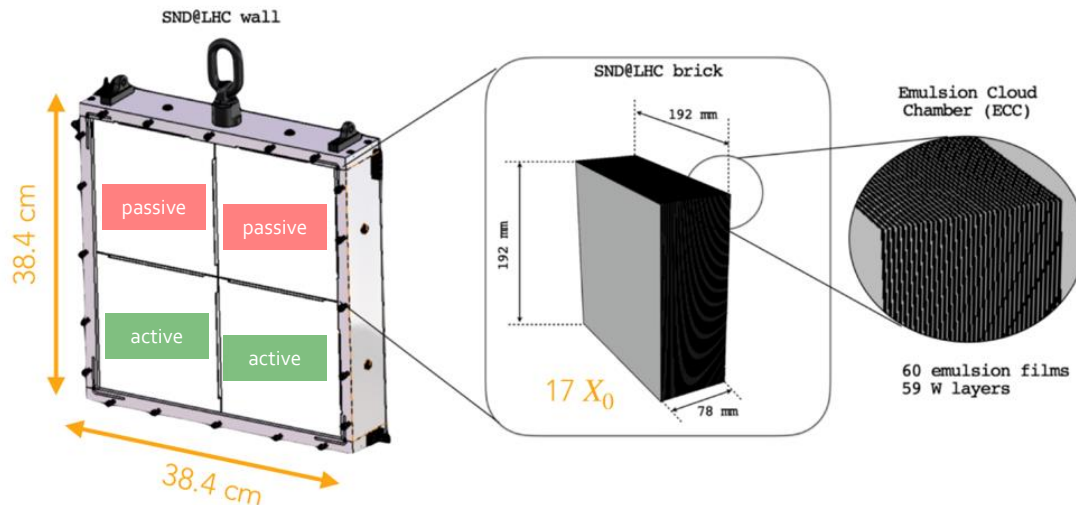

- reduce inefficiency
- better coverage at the bottom edge of the target

Veto system performance improved by an order of magnitude

[2] SND@LHC collaboration, Observation of collider muon neutrinos with the SND@LHC experiment
 [3] T. Ruf. Estimate of the Veto System Inefficiency 2022.
 [4] T. Ruf. Estimate of the Veto System Inefficiency 2023.

Since the restart of LHC operations in 2024:
Muon background increased by a factor 2 → new LHC settings in the collimators near the detector
 New strategy for the emulsion target replacement:
 → instrument only the lower half target: the muon flux is larger in the upper part of the target while the neutrino flux is higher at the bottom
 → keep 65% of events
 → limit exposure to 12 fb^{-1}

Test beam in August 2023 to **calibrate HCAL response**

The test beam setup consists of

- 4 **scintillating fibres (SciFi)** modules, each made of an x and y plane;
- 5 **upstream modules (US)**, made of horizontal 6 cm thick scintillating bars;
- 1 **downstream module (DS)**, divided in a horizontal a vertical plane, made of 1 cm thick scintillating bars.
- The active modules are interleaved by **iron blocks** $0.5 \lambda_{int}$ wide for the **SciFi** part and $1 \lambda_{int}$ in between the **US** and **DS** modules.

Reconstructing shower energy and direction is necessary to fully reconstruct ν interaction

compute incoming neutrino energy

Paper in preparation

HCAL calibration

ALMA MATER STUDIORUM
UNIVERSITA DI BOLOGNA

Istituto Nazionale di Fisica Nucleare
Sezione di Bologna

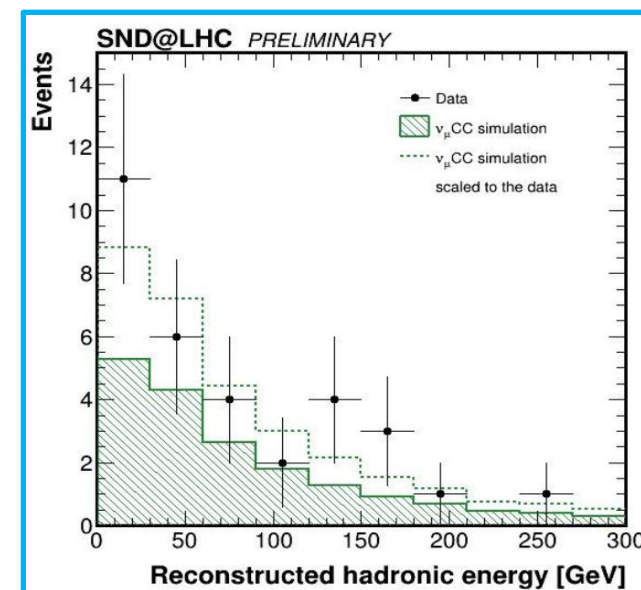

Studying the QDC (digitized value of integrated charge) in shower events

$$E = k \times QDC_{SciFi} + \alpha \times QDC_{US}$$

with E incoming hadron energy, k and α two calibration constants

Next step:
optimize to apply
on T118 data

Computed and validated with test beam data:
Obtained energy resolution $\sim 12\%$ to 22% depending on incoming particle energy

Under study the possibility to improve muon track reconstruction currently done with DS modules by adding drift tubes stations

Measure muon trajectory with CMS Drift Tube small size replicas → **MiniDTs** [6]

Expected ~150 μm point resolution instead of ~cm of DS modules

[6] Paggi, Construction and test of a cosmic ray telescope based on CMS Drift Tube chambers and data acquisition prototypes of the Phase-2 upgrade

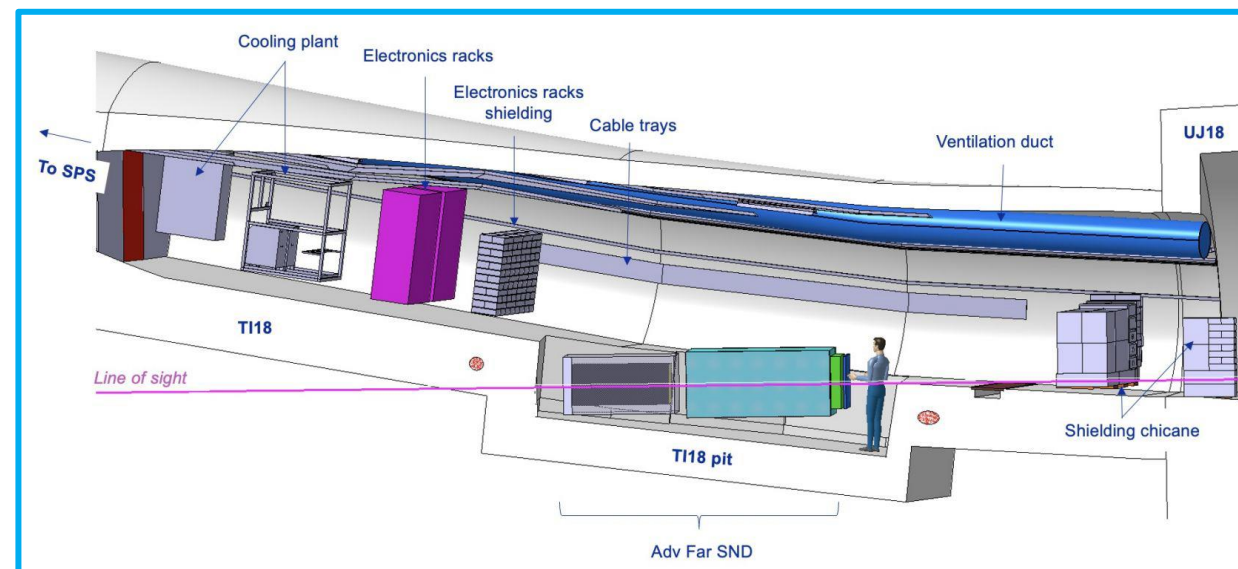

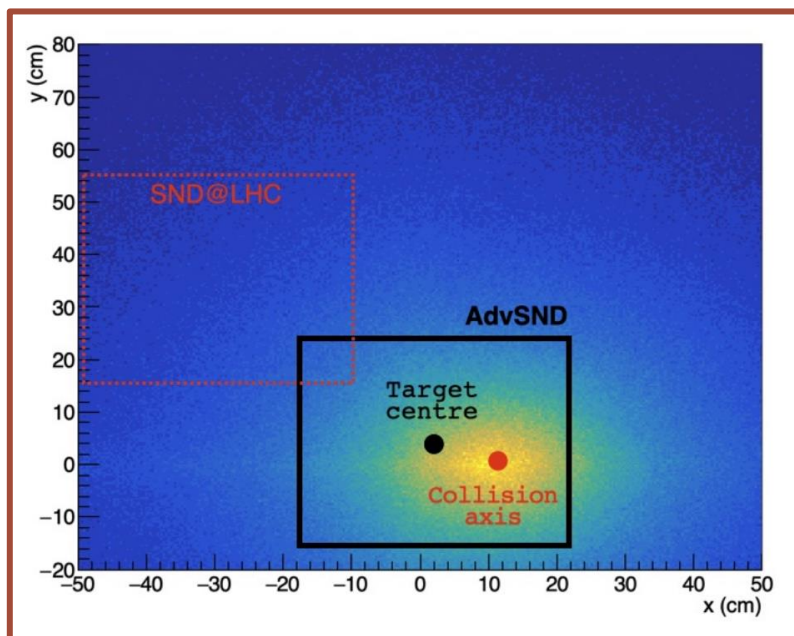

HL-LHC UPGRADE ADVSND

ADV/SND/04.11

Proposed upgrade in LS 3:

- Need for civil engineering → modify detector position to **optimize acceptance** with all crossing angle configurations proposed for LHC Run 4 and 5

Compact option → **only floor excavation**

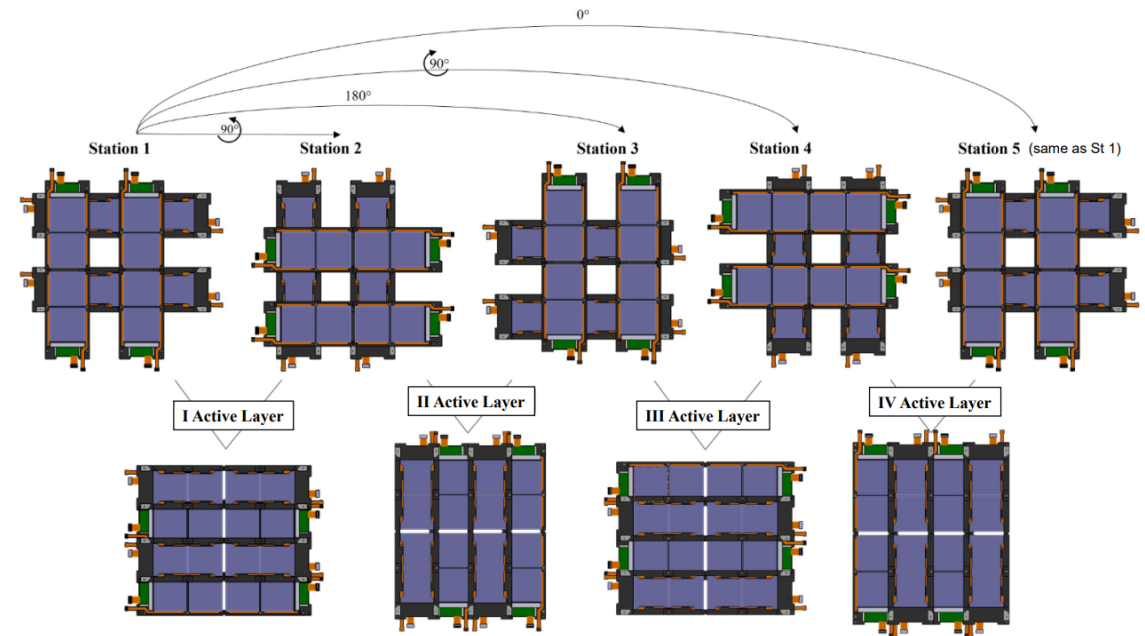

Magnetize HCAL

Aim: get ~20% momentum resolution for muons to achieve good charge identification for muons of ~1 TeV

Need to replace vertex detector → HL-LHC will produce a muon flux too intense to use the emulsion cloud chambers

New silicon vertex detector → reuse CMS Tracker Outer Barrel strips modules

100 stations interleaved with tungsten
total mass 1.75 t

- Add a **coil around the detector** →
magnetize the iron with 1.75 T
to increase muon charge sensitivity
- Use spare CMS TOB modules from target
construction to equip several planes across the
HCAL section → $\sim 30 \mu\text{m}$ point resolution to achieve
 $\sim 20\%$ momentum resolution for 1 TeV muons

- 15 strip modules per layer
- **Staggered front and back** of same module to maximize coverage

Physics reach of AdvSND

ALMA MATER STUDIORUM
UNIVERSITÀ DI BOLOGNA

Istituto Nazionale di Fisica Nucleare
Sezione di Bologna

- Larger statistics → improved uncertainties
 - Lepton Flavour Universality (LFU) → expected uncertainty of this measurement in Run 3 dominated by a 30% statistical uncertainty due to the limited ν_τ sample
- ν_e s can be used as a probe of charm production to constrain gluon PDF in the very small Bjorken x region

Measurement	Uncertainty		Uncertainty	
	Stat.	Sys.	Stat.	Sys.
Charmed hadron yield	5%	35%	1%	5%
ν_e/ν_τ ratio for LFU test	30%	22%	5%	10%
ν_e/ν_μ ratio for LFU test	10%	10%	1%	5%
ν_μ and $\bar{\nu}_\mu$ cross-section	-	-	1%	5%

Adding a magnetic field:

- allow separate identification of neutrino and anti-neutrino interactions for both muon and tau neutrinos
- **first experimental direct observation** and the study of tau anti-neutrinos up to 1 TeV

Summary

ALMA MATER STUDIORUM
UNIVERSITÀ DI BOLOGNA

In Run 3:

- Modified detector setup
 - New veto plane → efficient charged particles tagging
 - Modified emulsion cloud chamber vertex detector → sustain muon background in new LHC configuration
- Working on full reconstruction of neutrino interaction → compute hadronic shower direction and energy
- Feasibility study for additional upgrade next YETS → enhance muon tracking capability

For HL-LHC:

- Proposed upgrade:
 - New vertex detector
 - Add magnetic field → identify muon and tau neutrinos and anti-neutrinos up to 1 TeV

Neutrinos at LHC

ALMA MATER STUDIORUM
UNIVERSITA' DI BOLOGNA

Istituto Nazionale di Fisica Nucleare
Sezione di Bologna

Feasibility of high energy neutrino studies at LHC has been investigated since the 90's

→ Possibility to study $pp \rightarrow \nu X$ in an **unexplored range**

Small detector are possible [1] [2]:

→ **Large ν flux** in forward region from pp collisions

→ **High ν energies:** $E_\nu [10^2, 10^3] \text{ GeV}$, $\sigma_\nu \propto E_\nu$

Currently, two experiments in complementary ranges:

→ **FASER ν** on axis: $\eta > 9$

→ **Scattering and Neutrino Detector at the LHC** slightly off axis:

$$7.2 < \eta < 8.4$$

SND@LHC Event Display (6th of July 2022)

September 2021

December 2021

March 2022

Hybrid detector composed of:

- Veto system
 - 3 planes of scintillating bars to tag incoming charged particles
- Target with vertex detector and electromagnetic calorimeter
 - Emulsion plates interleaved with tungsten (Emulsion cloud chamber) for tracking and vertex identification
 - Scintillating fibers (SciFi) for time and calorimetric information
- Hadronic calorimeter and muon system
 - 5+3 scintillator planes read by SiPMs interleaved with iron
 - 5 US: horizontal bars, focus on calorimeter
 - 3 DS: horizontal and vertical bars, focus on muon tracking
