Evidence for tWZ production in proton-proton collisions at $\sqrt{s} = 13$ TeV in multilepton final states

The CMS Collaboration*

Abstract

The first evidence for the standard model production of a top quark in association with a W boson and a Z boson is reported. The measurement is performed in multilepton final states, where the Z boson is reconstructed via its decays to electron or muon pairs and the W boson decays either to leptons or hadrons. The analysed data were recorded by the CMS experiment at the CERN LHC in 2016–2018 in proton-proton collisions at $\sqrt{s} = 13$ TeV, and correspond to an integrated luminosity of 138 fb^{-1} . The measured cross section is $354 \pm 54 (\text{stat}) \pm 95 (\text{syst}) \text{ fb}$, and corresponds to a statistical significance of 3.4 standard deviations.

Inclusive and differential measurement of top quark cross sections in association with a Z boson

The CMS Collaboration

Abstract

A measurement is presented of the inclusive and differential cross sections for top quark production in association with a Z boson, in pairs ($t\bar{t}Z$) or with a single top quark (tZq and tWZ). The data were recorded in pp collisions at a center-of-mass energy of 13 TeV, corresponding to an integrated luminosity of 138 fb^{-1} . Events with exactly three leptons, electrons or muons, are selected. A deep neural network is trained to separate the signal processes and the backgrounds. The $t\bar{t}Z$ and tWZ pro-

tWZ **t $\bar{t}Z$** **tZq**

Measurement of inclusive and differential cross sections for single top quark production in association with a W boson in proton-proton collisions at $\sqrt{s} = 13.6$ TeV

The CMS Collaboration

Abstract

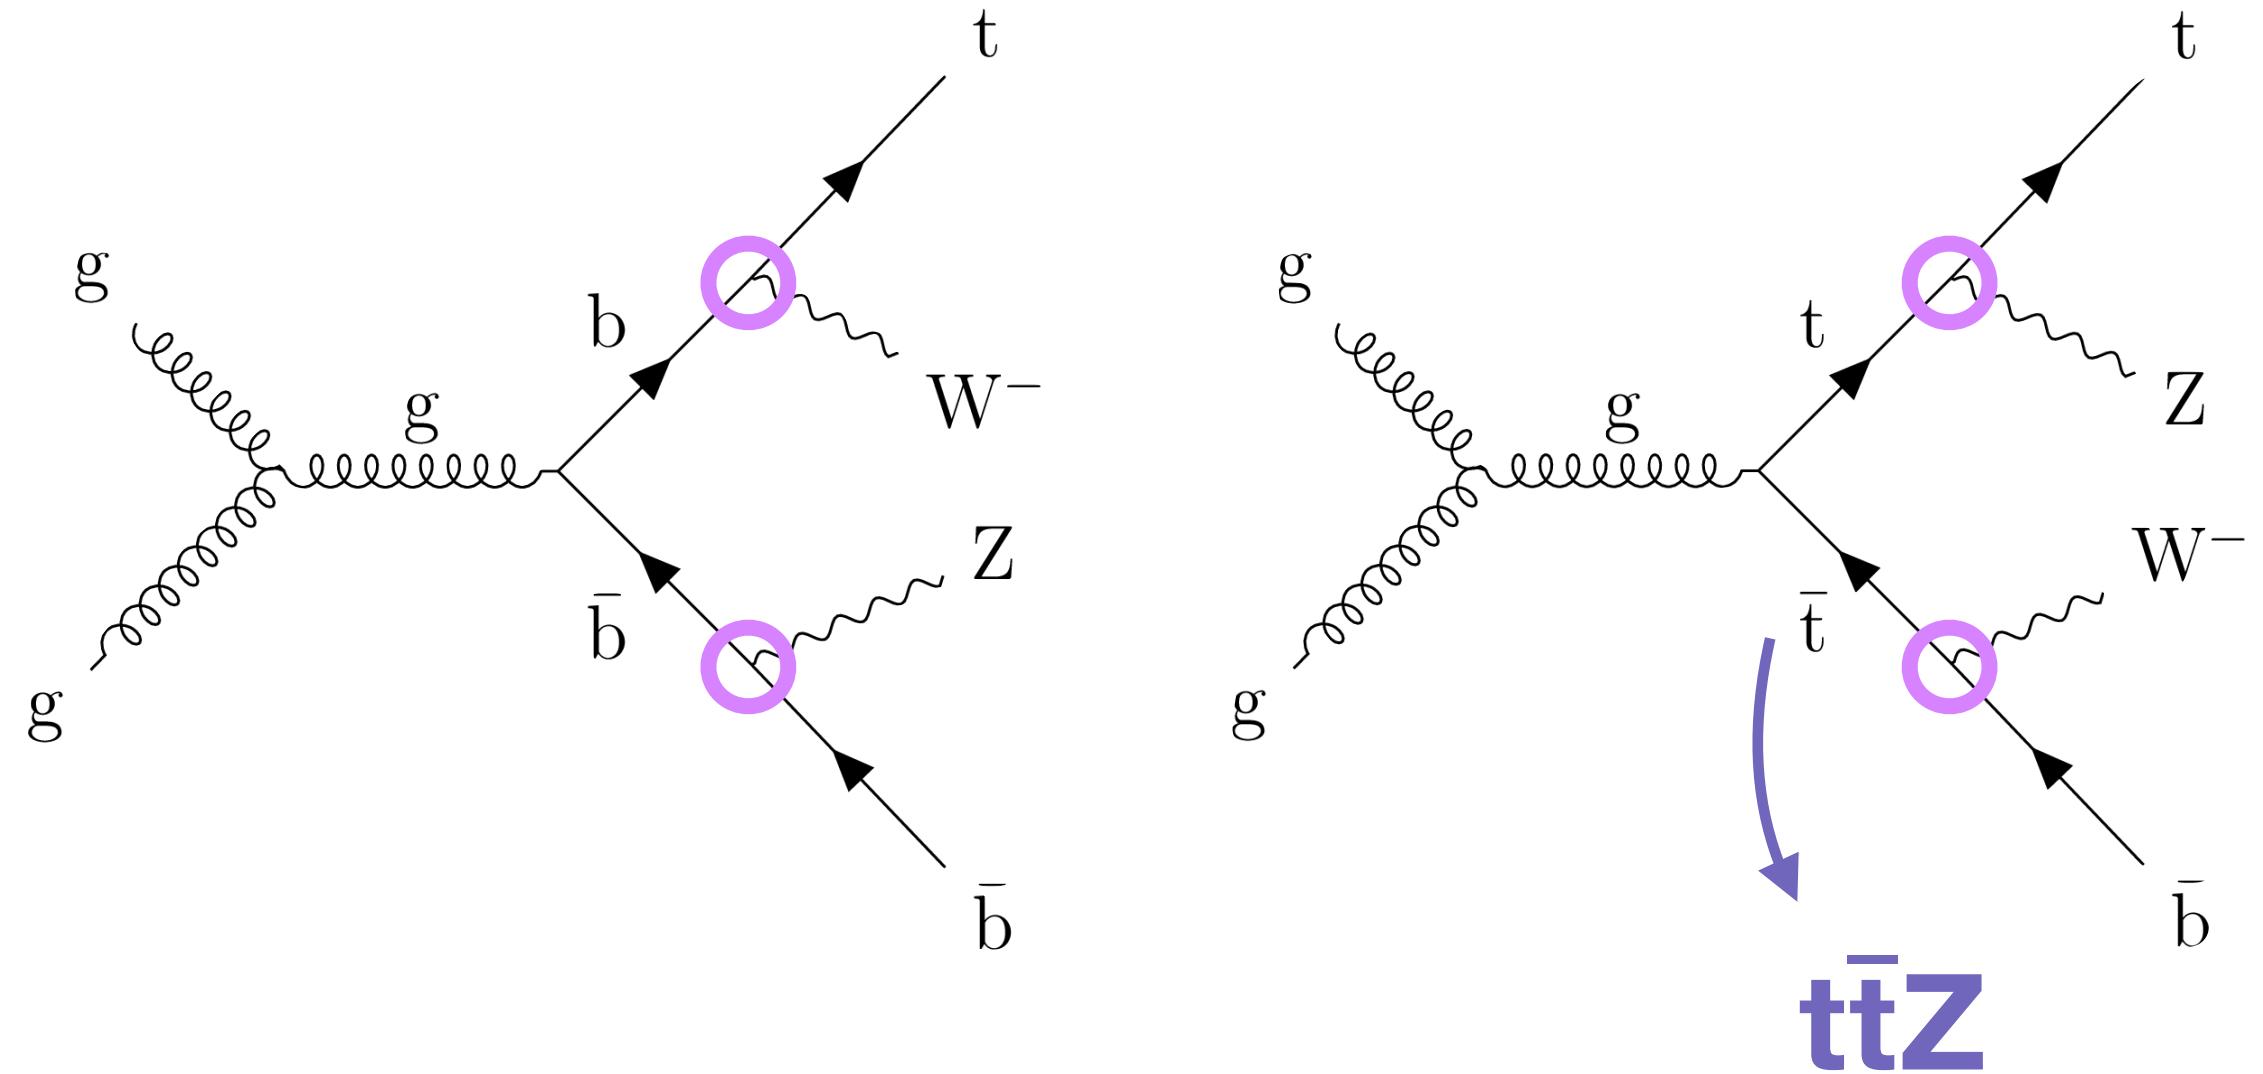

The first measurement of the inclusive and normalised differential cross sections for the production of single top quarks in association with a W boson in proton-proton collisions at a centre-of-mass energy of 13.6 TeV are presented. The data used were recorded with the CMS detector at the LHC during 2022, and correspond to an integrated luminosity of 34.7 fb^{-1} . The analyzed events contain one muon and one

tW

tWZ production

- Explore two top quark electroweak couplings in one process

tWZ:

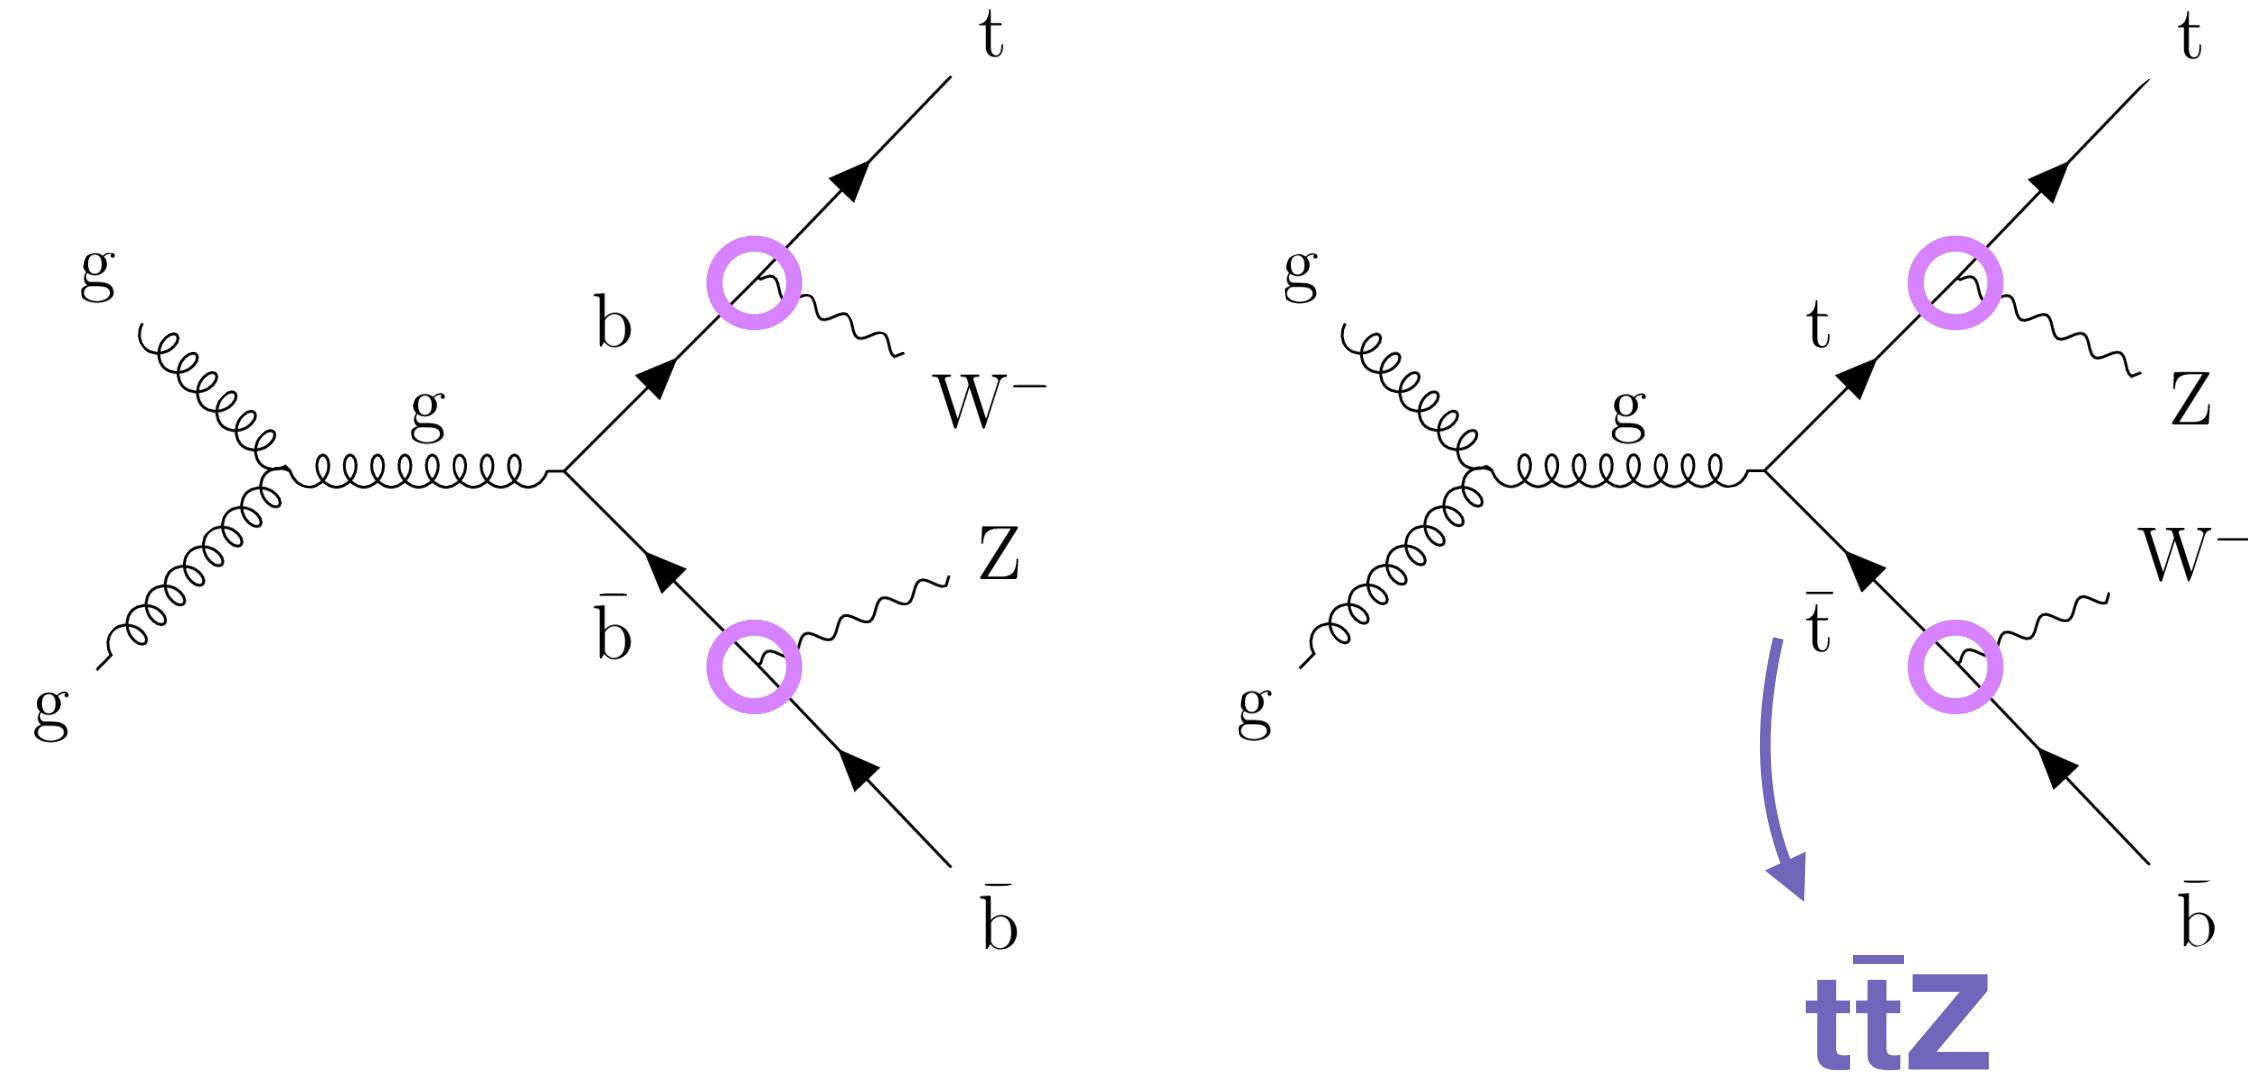

- Challenges:
 - Very rare process: exp. cross section $\sim 136 \text{ fb}$ (NLO in QCD)
 - Overwhelming and irreducible $t\bar{t}Z$ background
 - Interference with the $t\bar{t}Z$ process within the SM beyond the leading order

tWZ production

- Explore two top quark electroweak couplings in one process

tWZ:

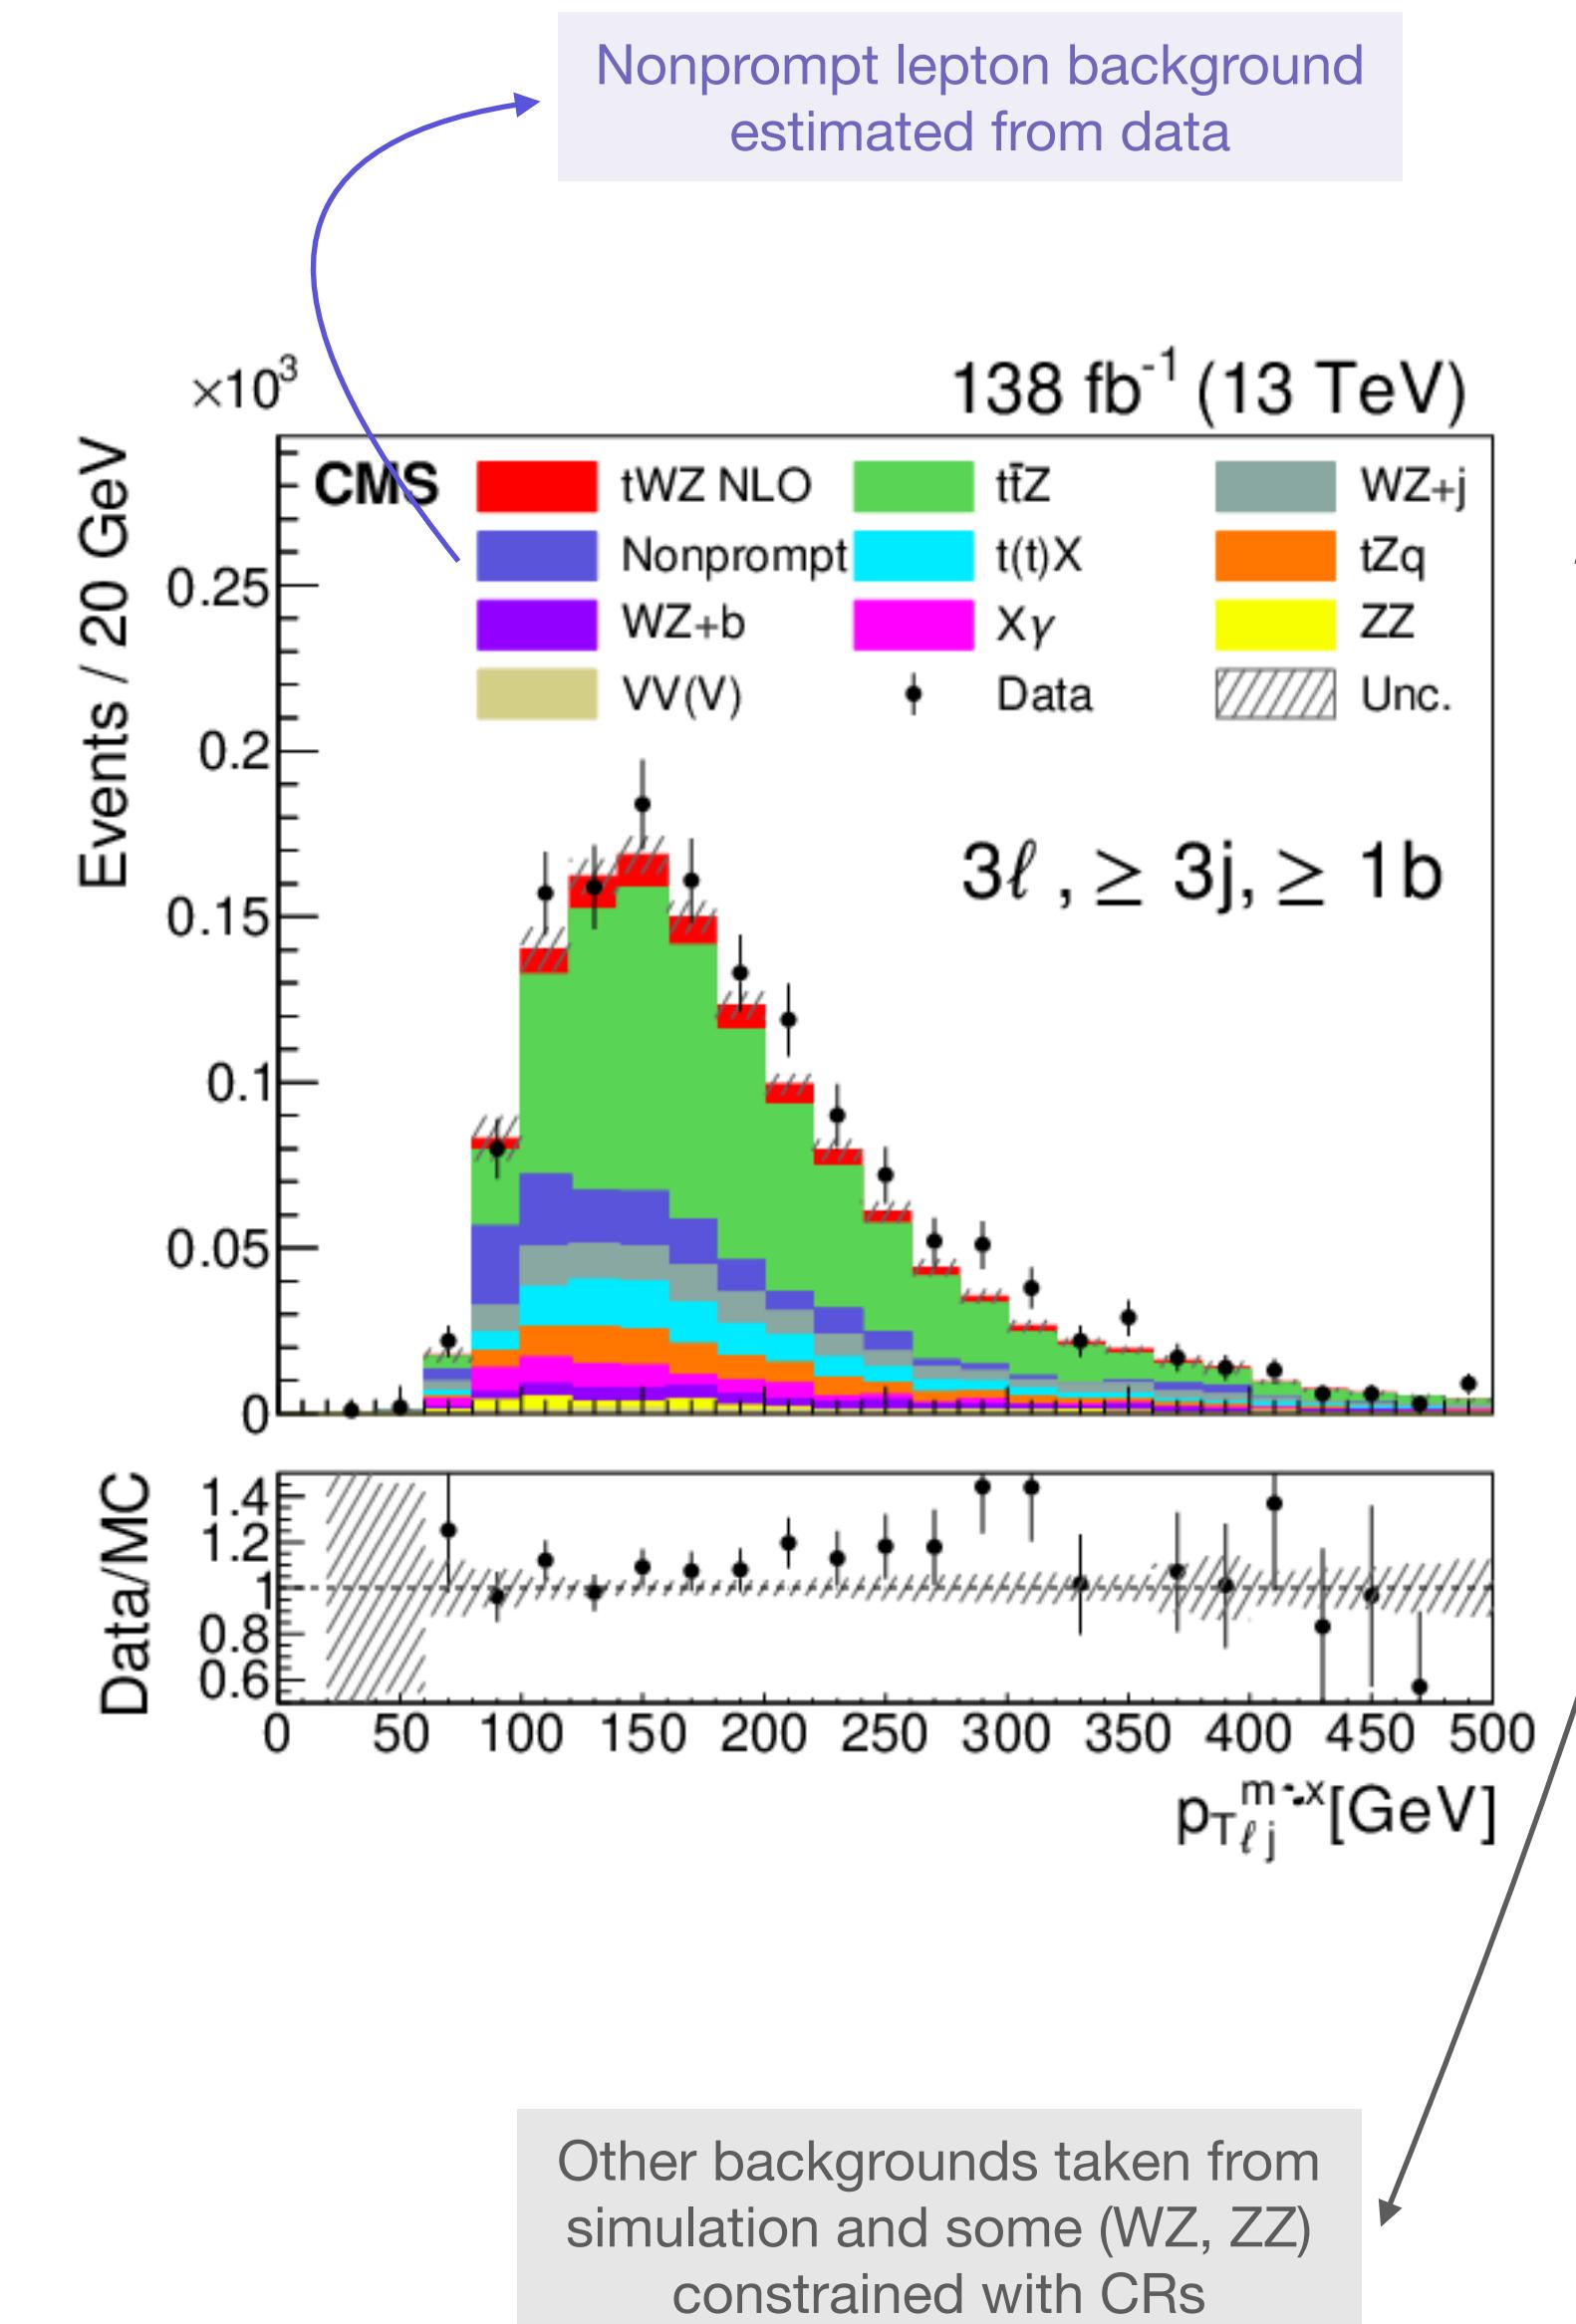

- Challenges:
 - Very rare process: exp. cross section $\sim 136 \text{ fb}$ (NLO in QCD)
 - Overwhelming and irreducible $t\bar{t}Z$ background
 - Interference with the $t\bar{t}Z$ process within the SM beyond the leading order

First analysis using state-of-the-art tWZ signal modeling at NLO, consistently treating the interference

Analysis strategy for tWZ

- Two regions of the phase space considered:
 - ✓ Low top quark p_T (**resolved**): higher stat., sensitive to the SM tWZ production
 - ✓ Top quark with $p_T > 270$ GeV (**boosted**): enhanced sensitivity for new phenomena
- Signal and control regions built based on number of leptons and b jets
 - Resolved: 3 leptons, 2j, ≥ 1 b
3 leptons, ≥ 3 j, $\geq 1(2)$ b
4 leptons, ≥ 1 b
 - Boosted: hadronic top decay (fat jet)
leptonic top decay (lep. top tagger)
 - Diboson CRs: 4 leptons (ZZ)
3 leptons, 0b (WZ)

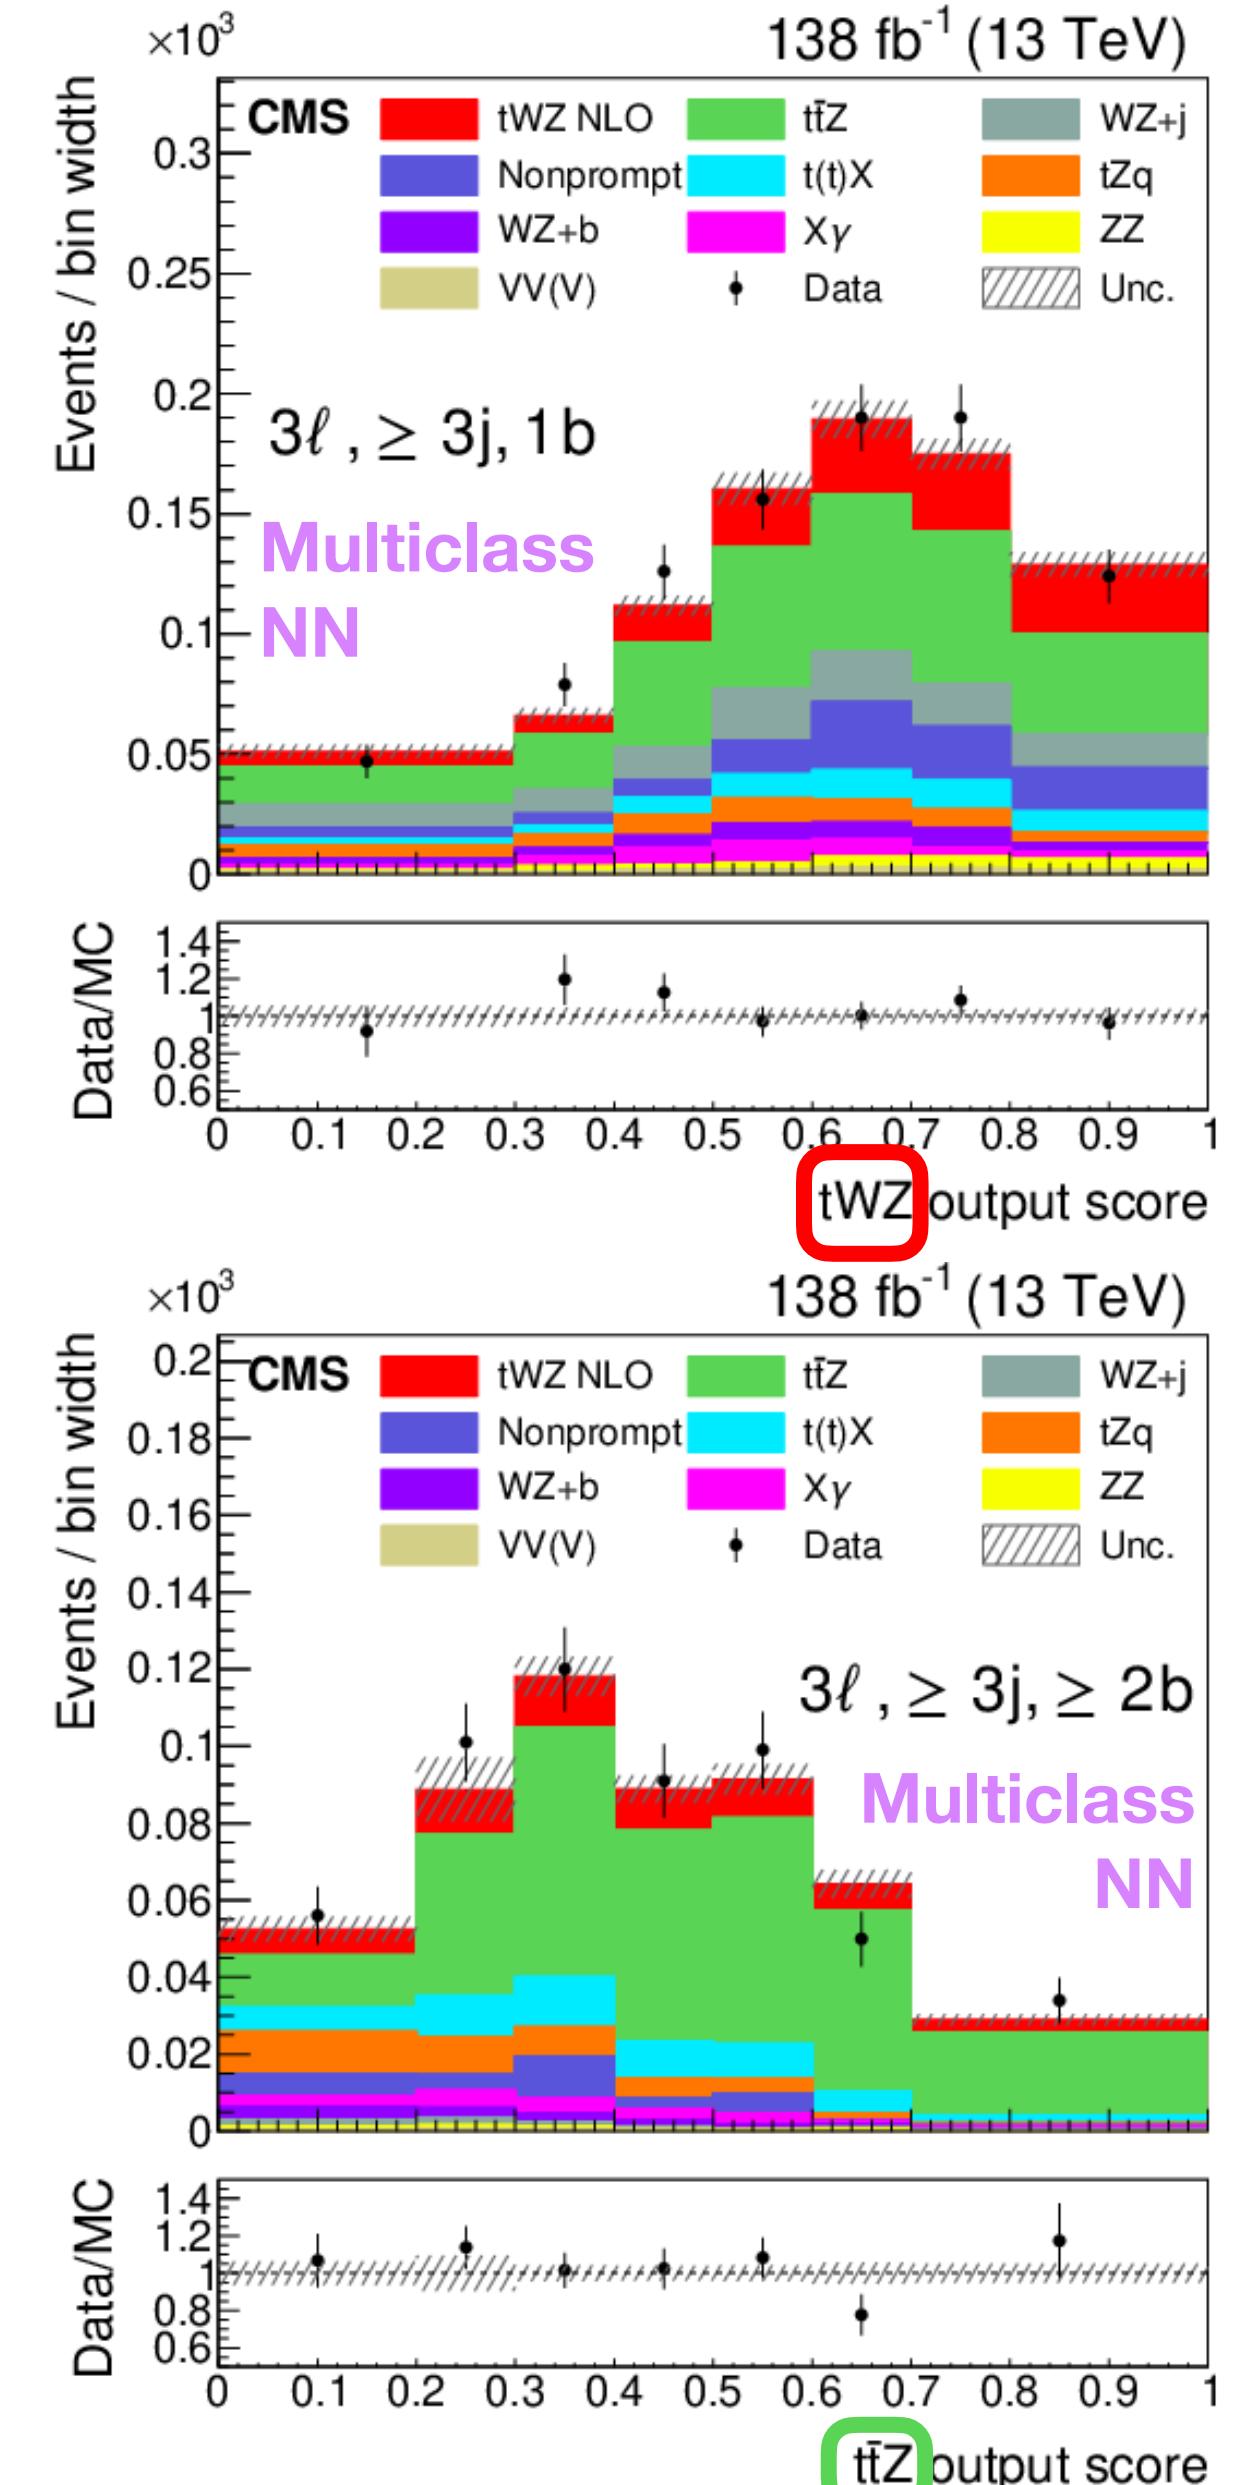

Simultaneous fit
of 7 distributions

Analysis strategy for tWZ

- Two regions of the phase space considered:
 - ✓ Low top quark p_T (**resolved**): higher stat., sensitive to the SM tWZ production
 - ✓ Top quark with $p_T > 270$ GeV (**boosted**): enhanced sensitivity for new phenomena
- Signal and control regions built based on number of leptons and b jets
 - Resolved: 3 leptons, 2j, ≥ 1 b → **Binary NN**
 3 leptons, ≥ 3 j, $\geq 1(2)$ b → **Multiclass NN**
 4 leptons, ≥ 1 b
 - Boosted: hadronic top decay (fat jet)
 leptonic top decay (lep. top tagger)
 - Diboson CRs: 4 leptons (ZZ)
 3 leptons, 0b (WZ)

**Simultaneous fit
of 7 distributions**

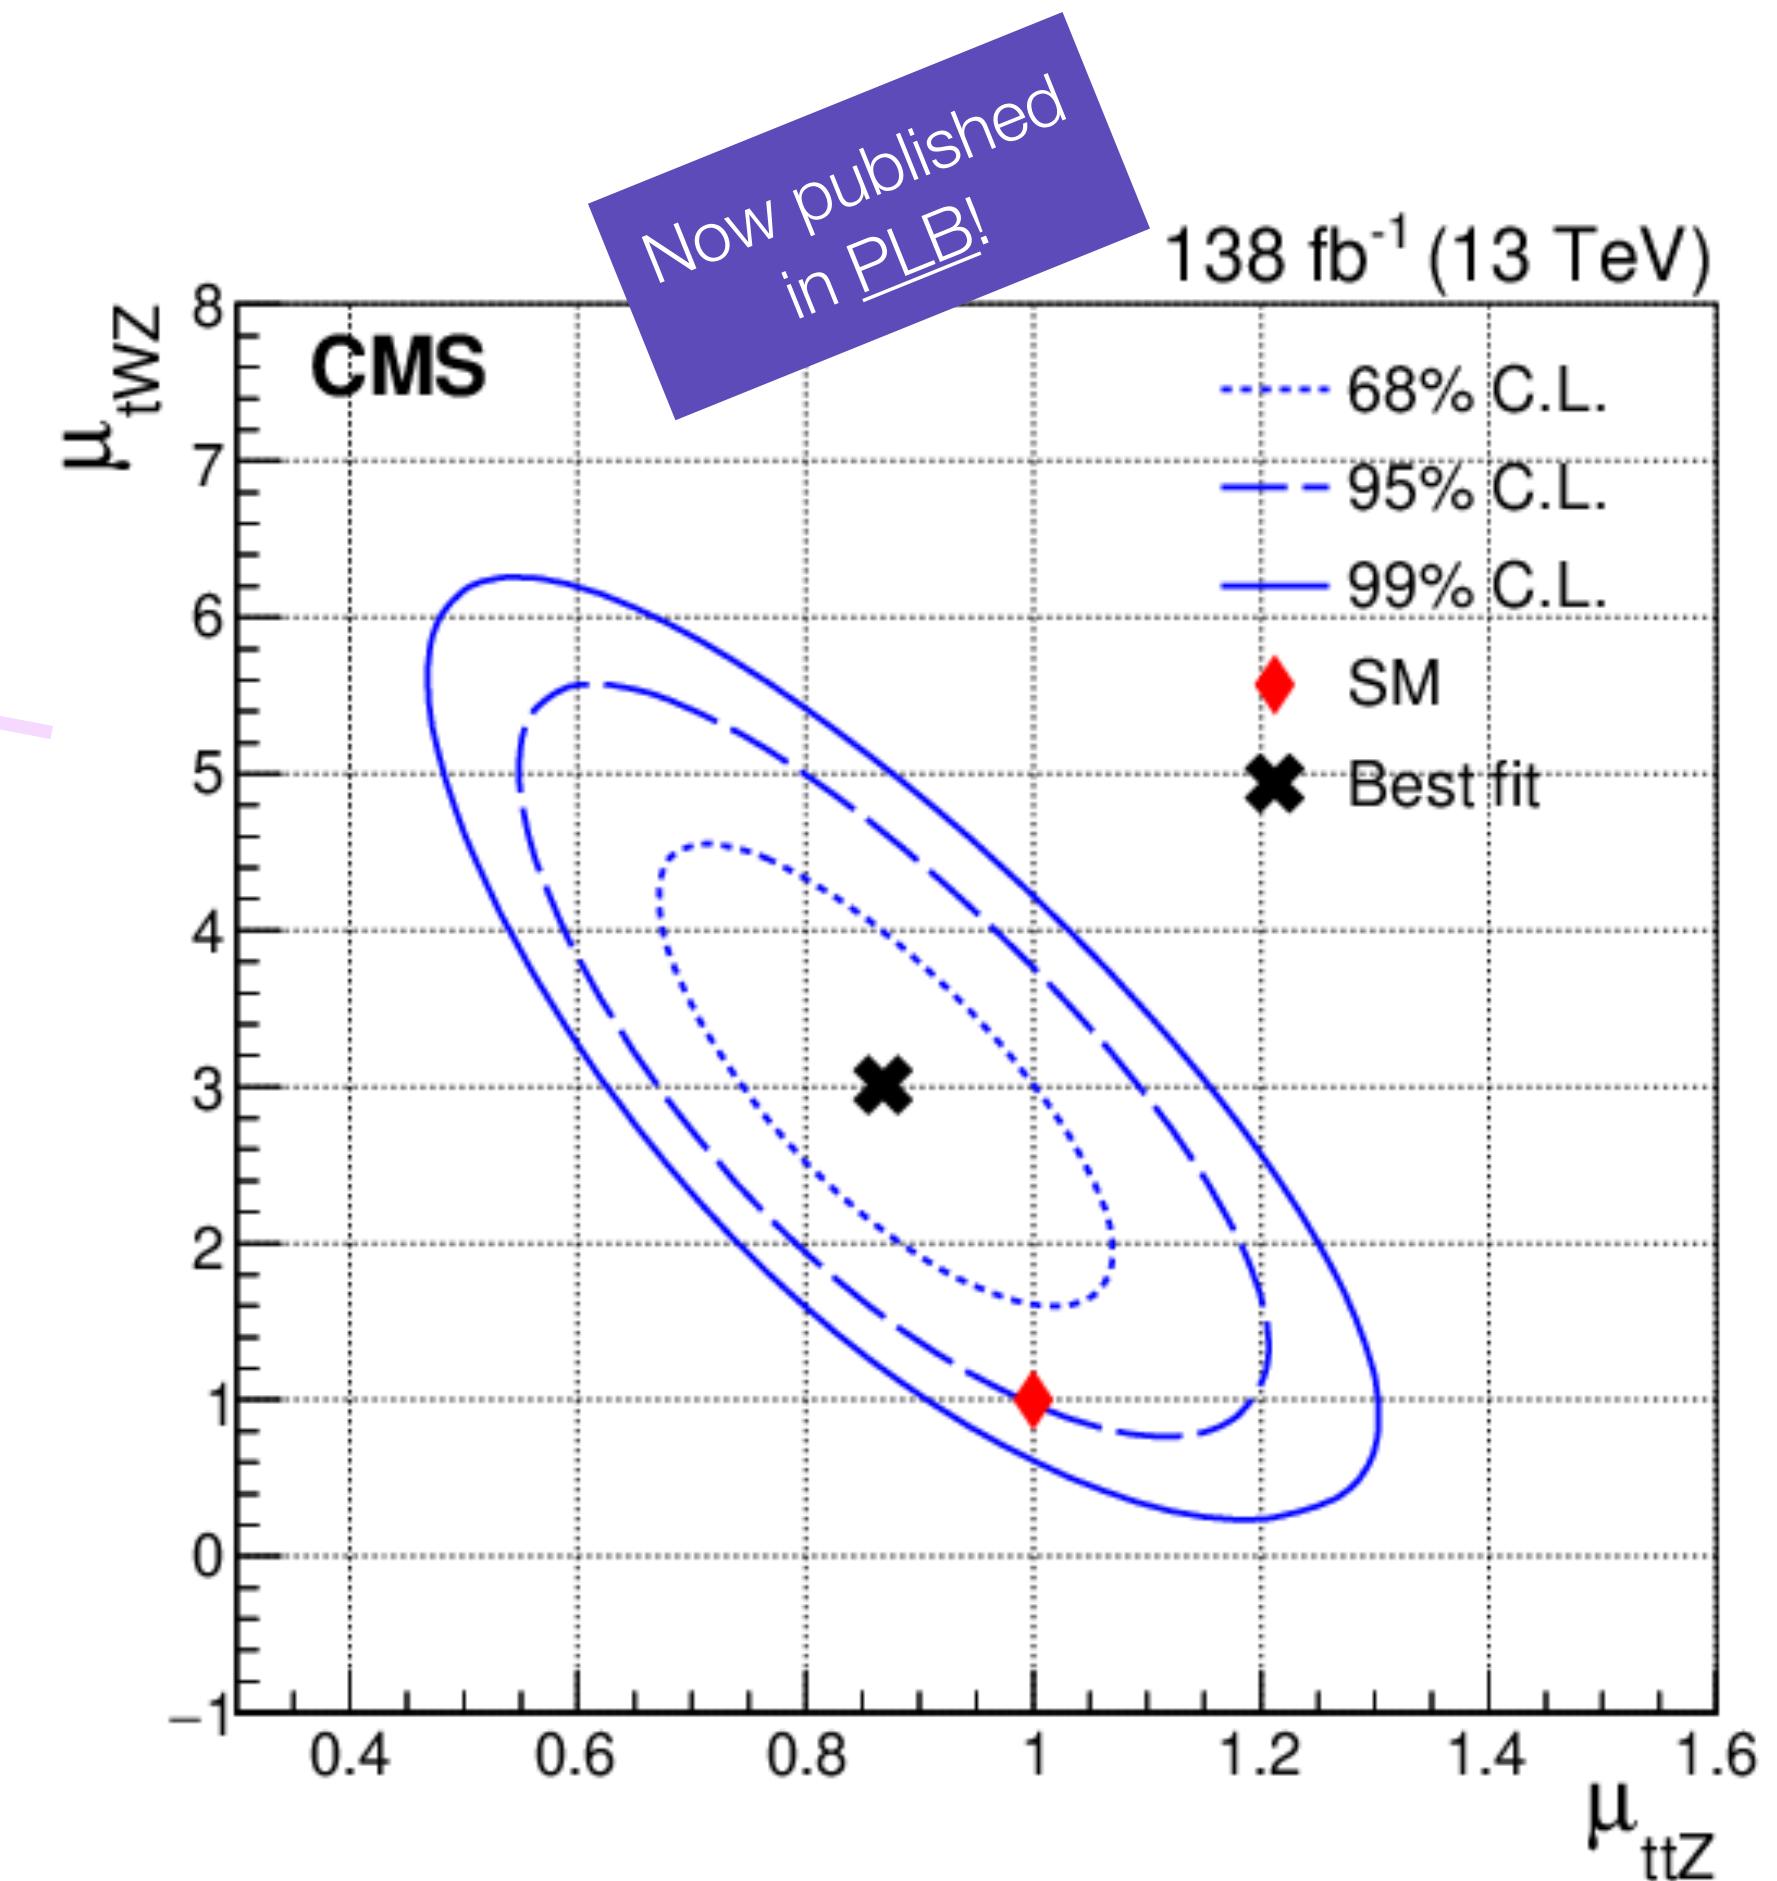

Inclusive tWZ cross section

- Observed (expected) significance of 3.4σ (1.4σ) → **evidence!**

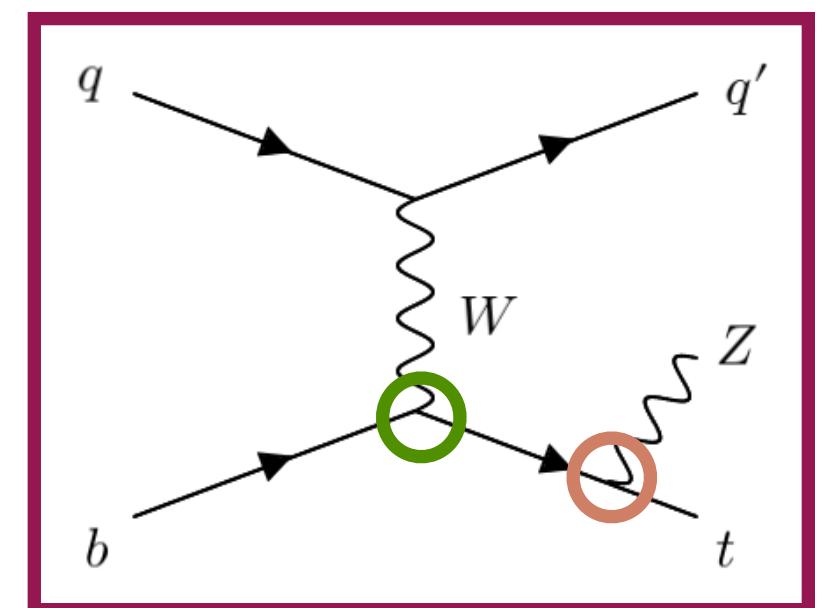

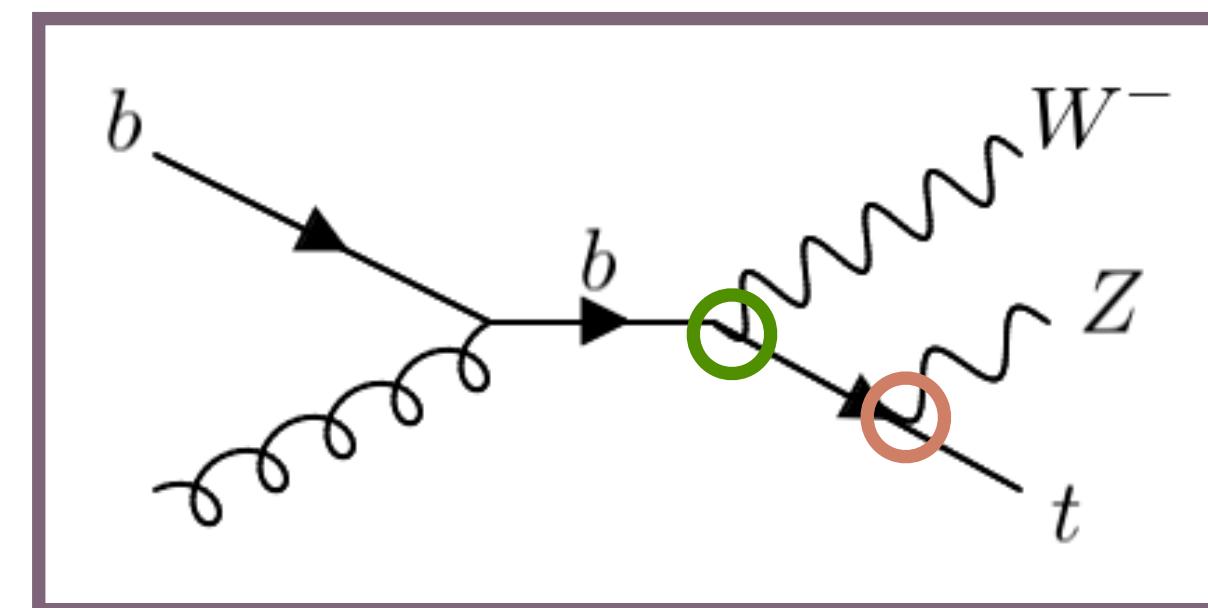

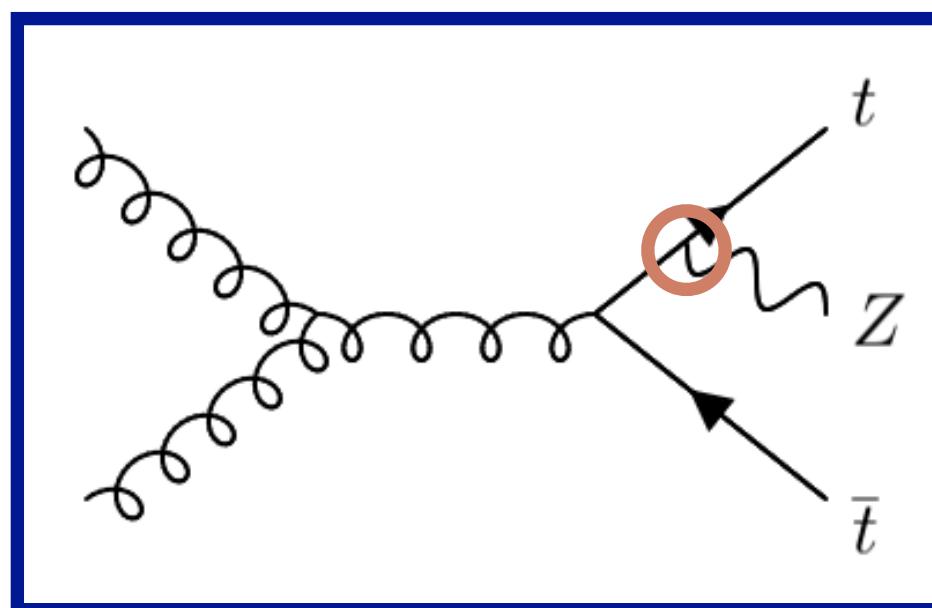

$\sigma_{tWZ} = 354 \pm 54 \text{ (stat)} \pm 95 \text{ (syst)} \text{ fb}$
(two s.d. above the SM)
- Dominant systematic uncertainties:
 - $t\bar{t}Z$ normalization: 18% - strongly anti-correlated with the signal

Additional studies showed that when fixing the $t\bar{t}Z$ cross section to the previously measured value, the significance stays above 3σ
 - Other background normalization
 - Sensitivity driven by resolved SRs, especially the SR with **3 leptons, $\geq 3j$, $\geq 1b$**

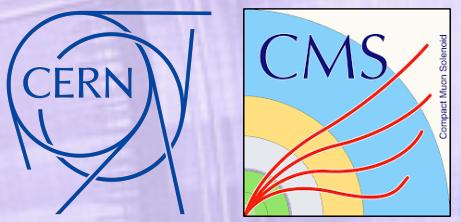

Simultaneous measurement of $t\bar{t}Z$, tWZ , and tZq

- $t\bar{t}Z$ and tZq already measured, inclusively and differentially
- Evidence for tWZ production (previous slides)
- Significant interference between tWZ and $t\bar{t}Z$ beyond leading order

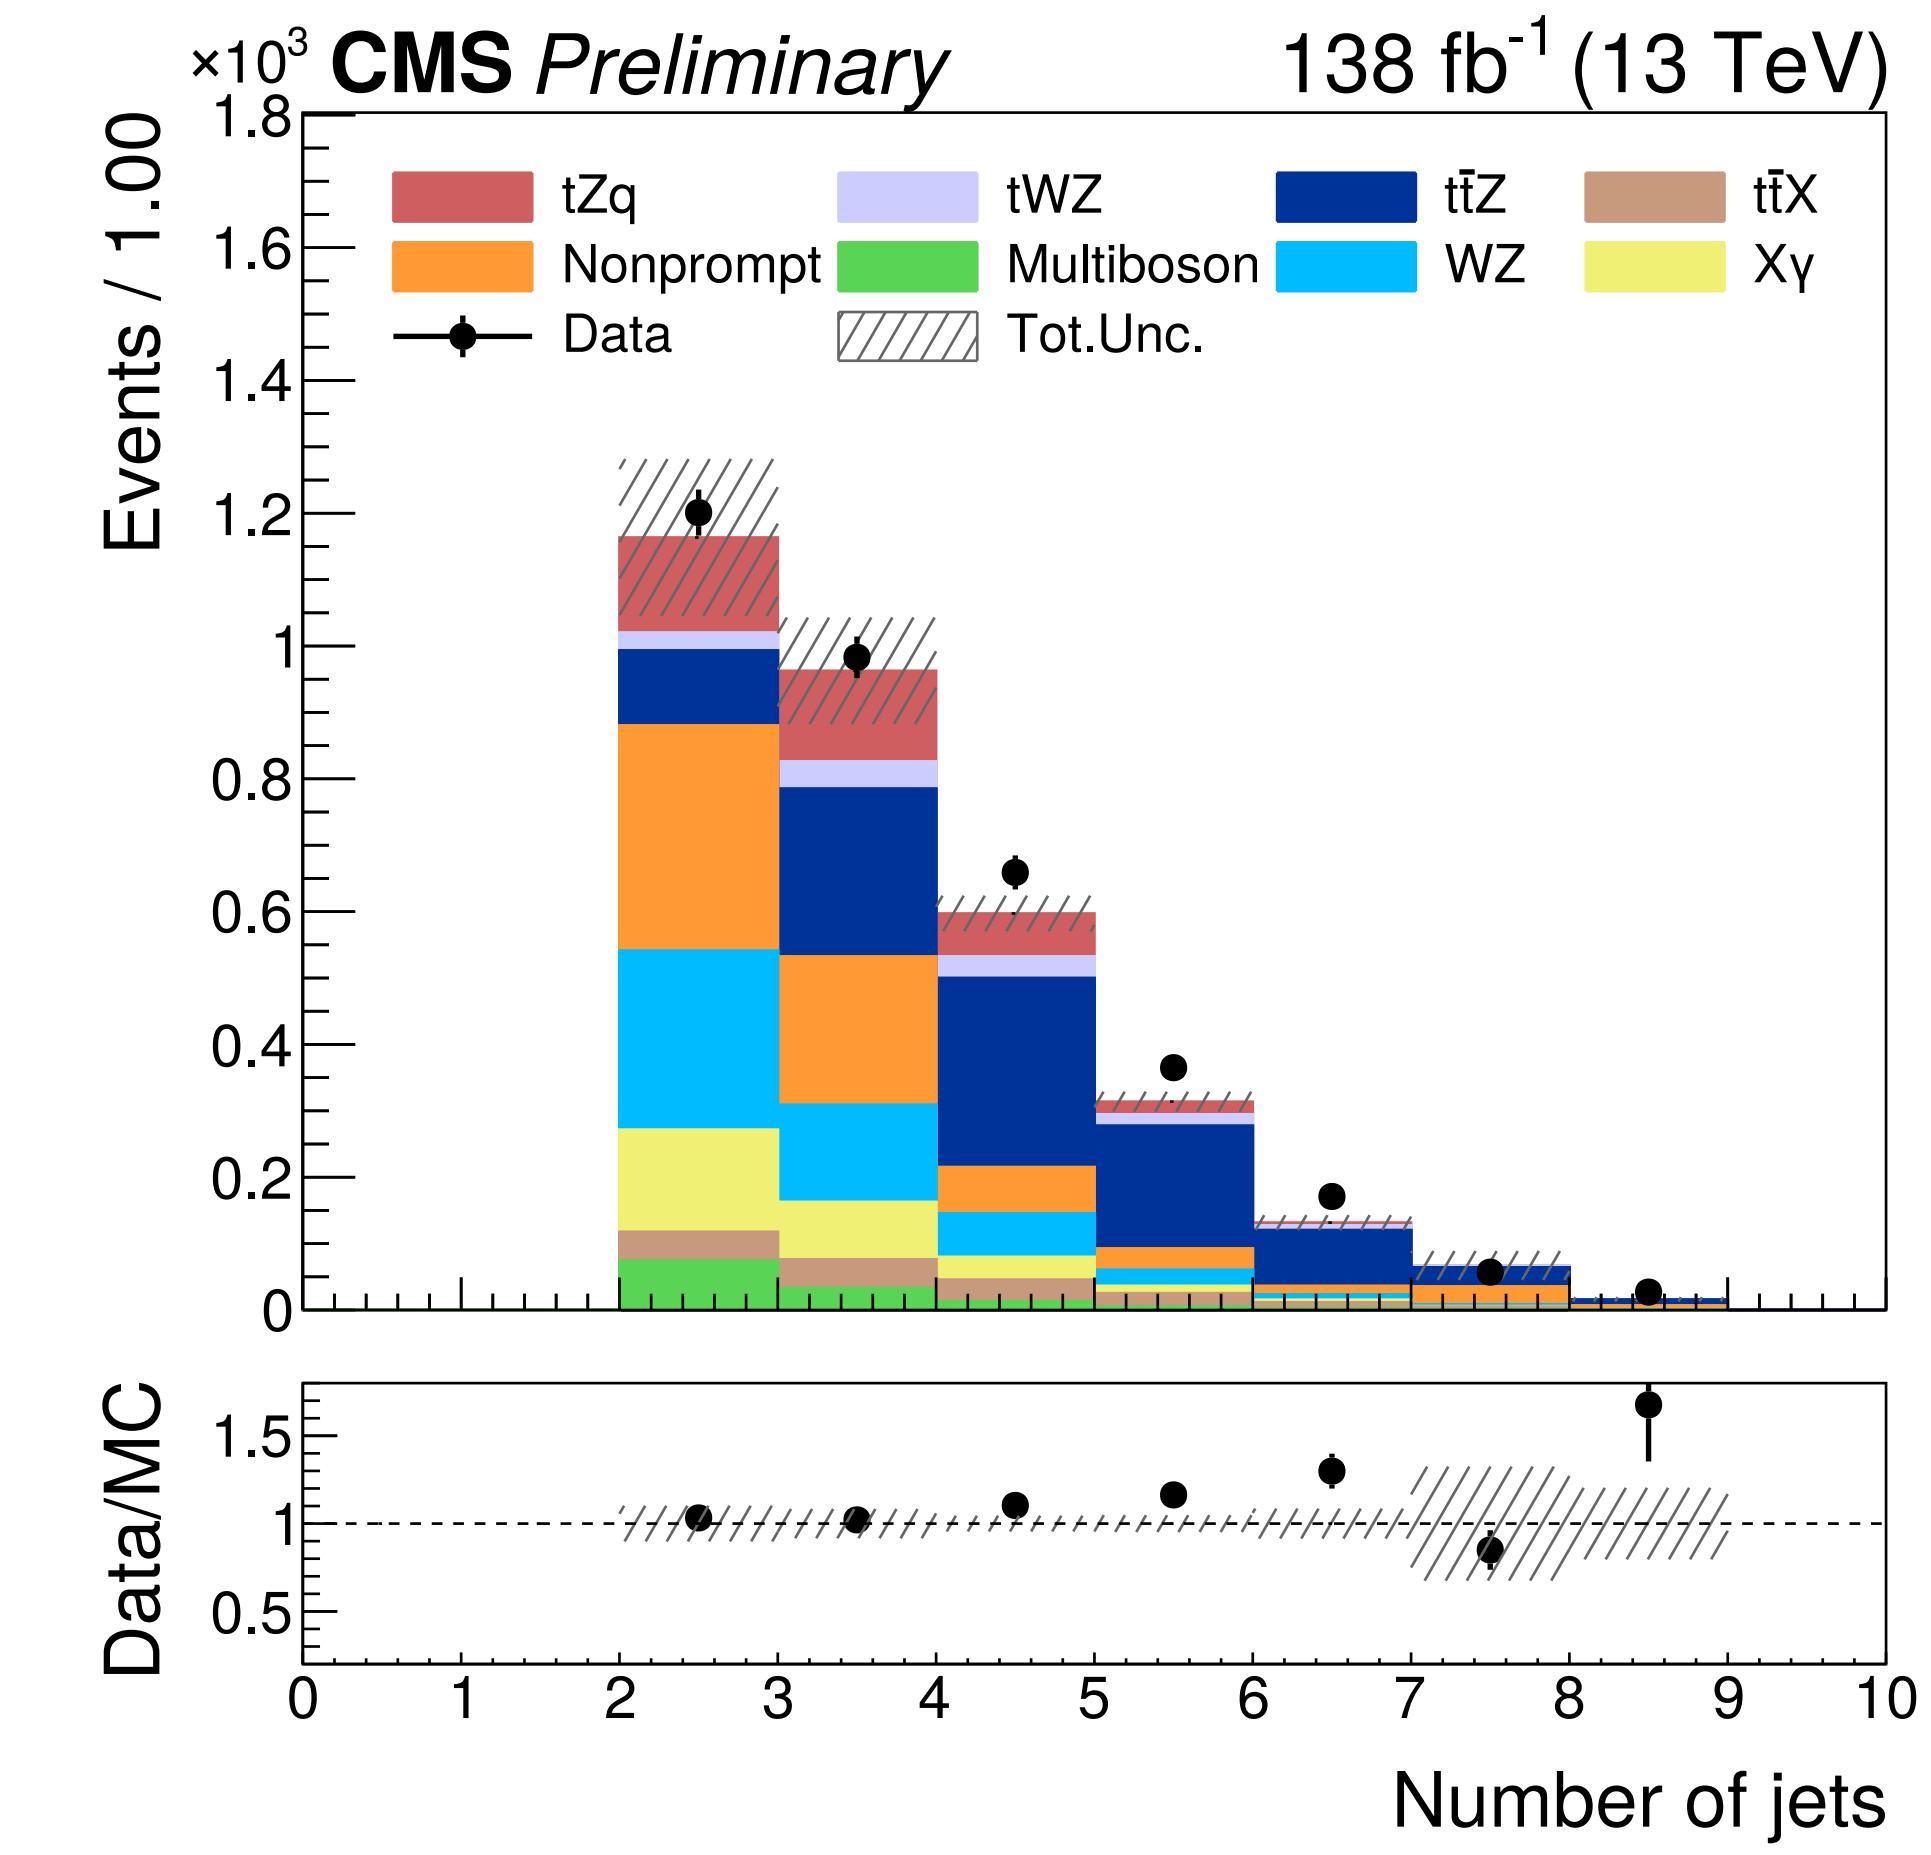

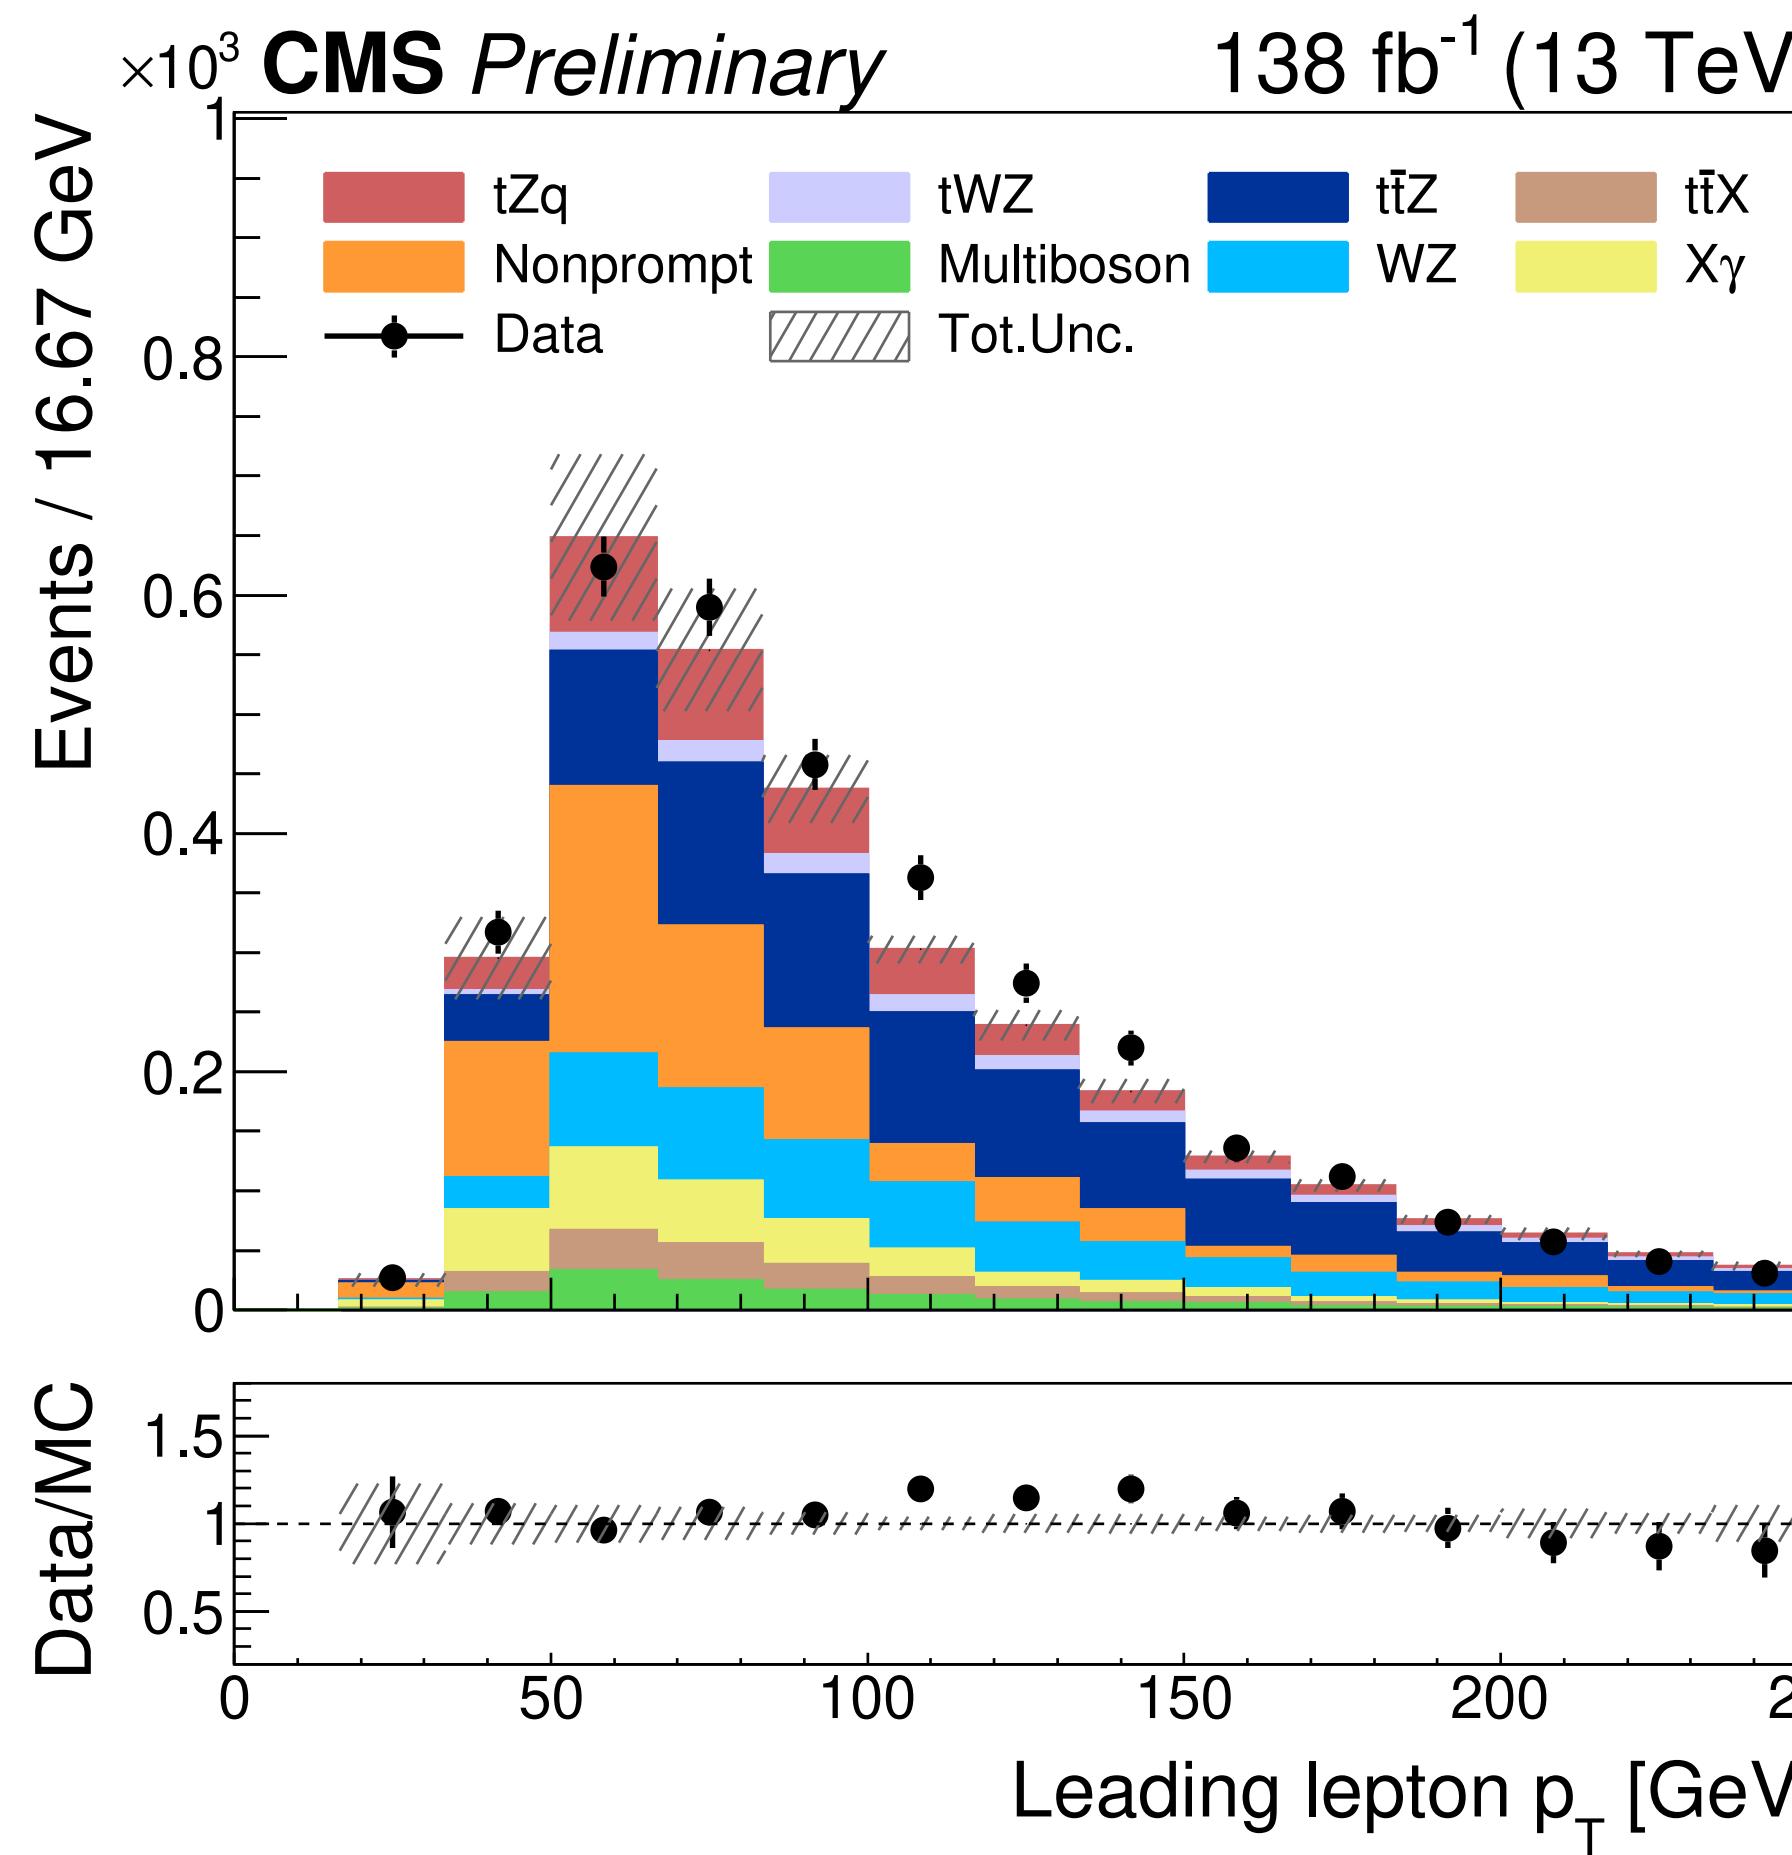

- Simultaneous measurement:
 - less dependency on signal modelling assumptions
 - processes are major backgrounds to each other
 - consistently treat correlations between systematic uncertainties
 - ◆ enhance sensitivity to deviations from SM that affect all processes (e.g. anomalous tZ , tbW couplings)
- **Strategy: Measure $t\bar{t}Z$ + tWZ together, and simultaneously with tZq**

Selection strategy for $t\bar{t}Z$, tWZ , and tZq

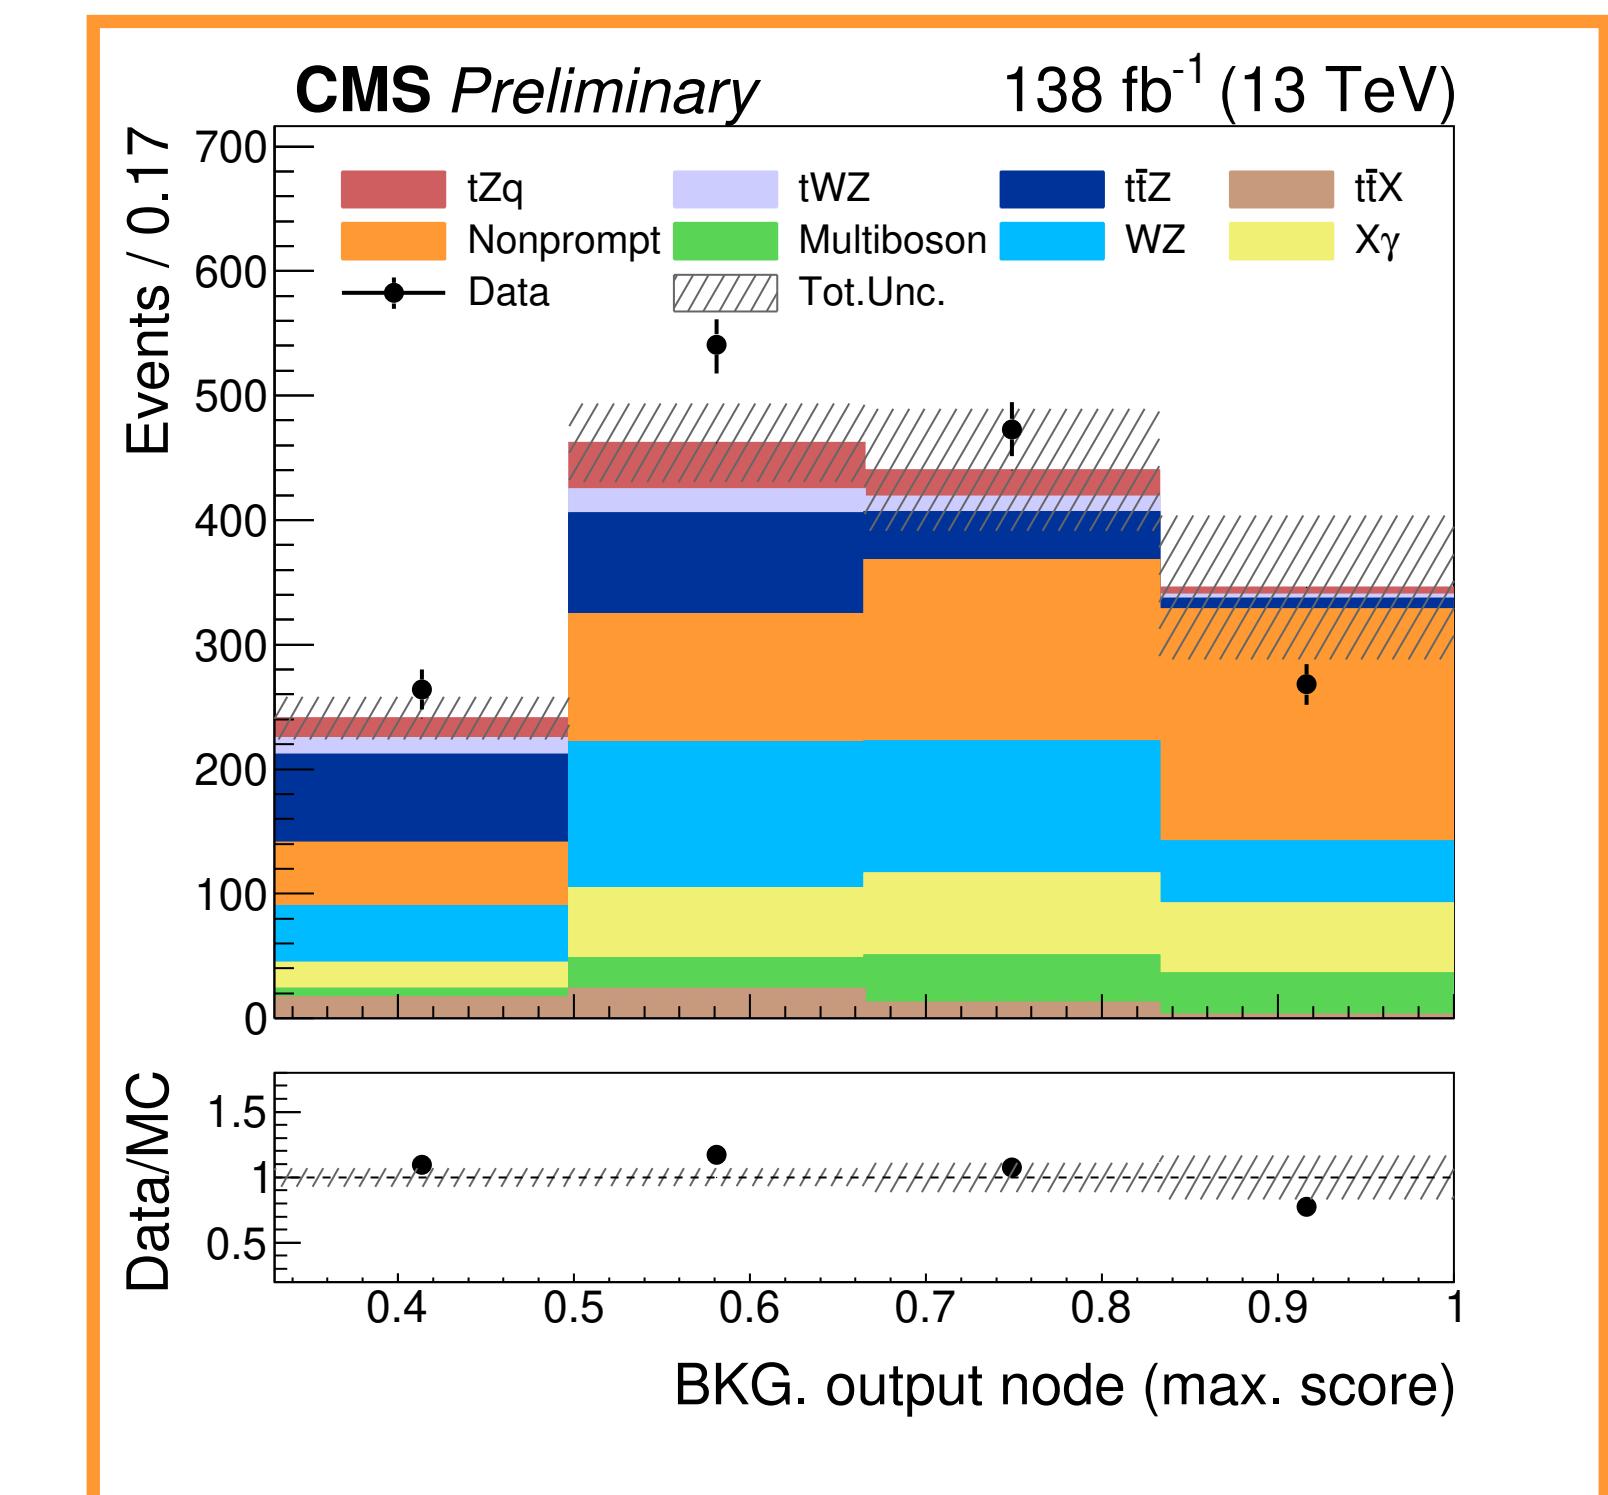

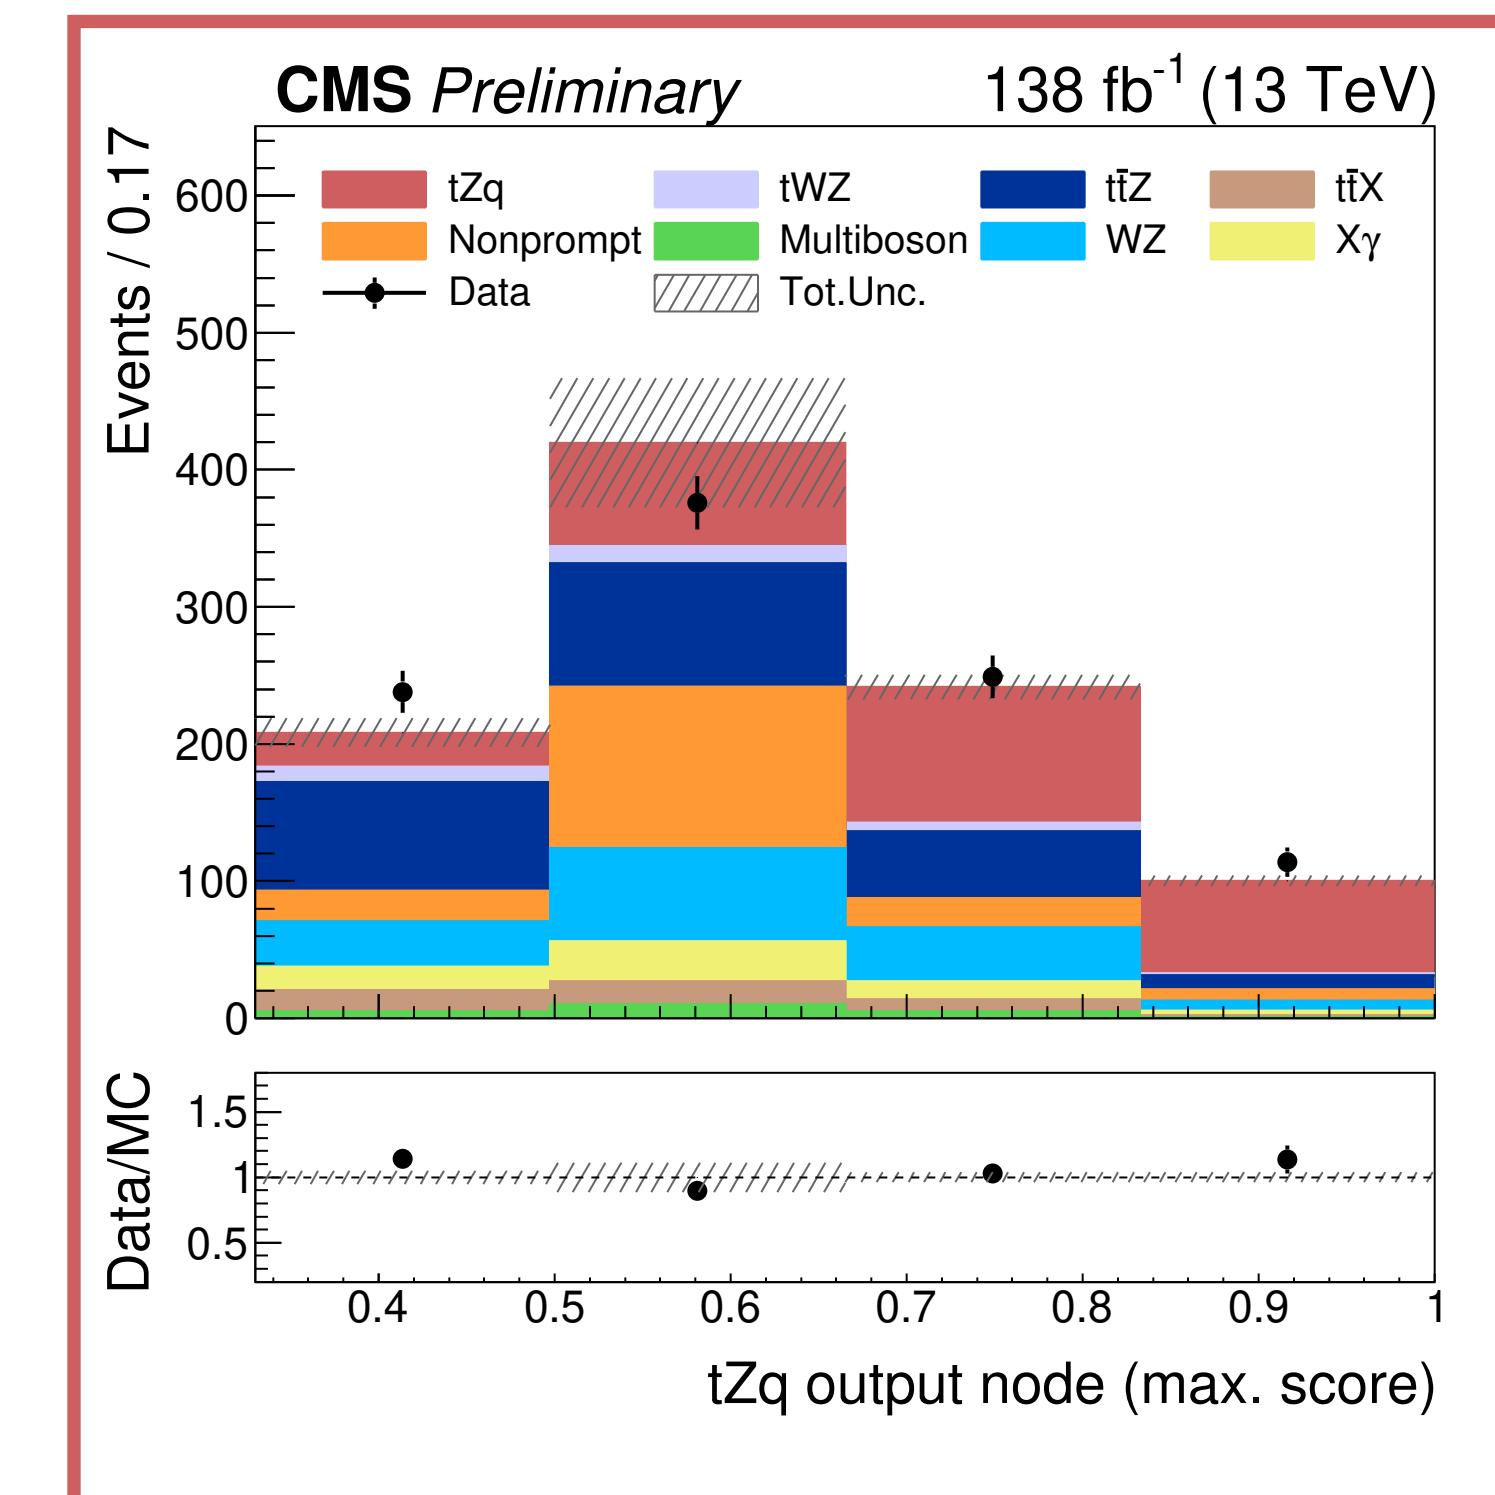

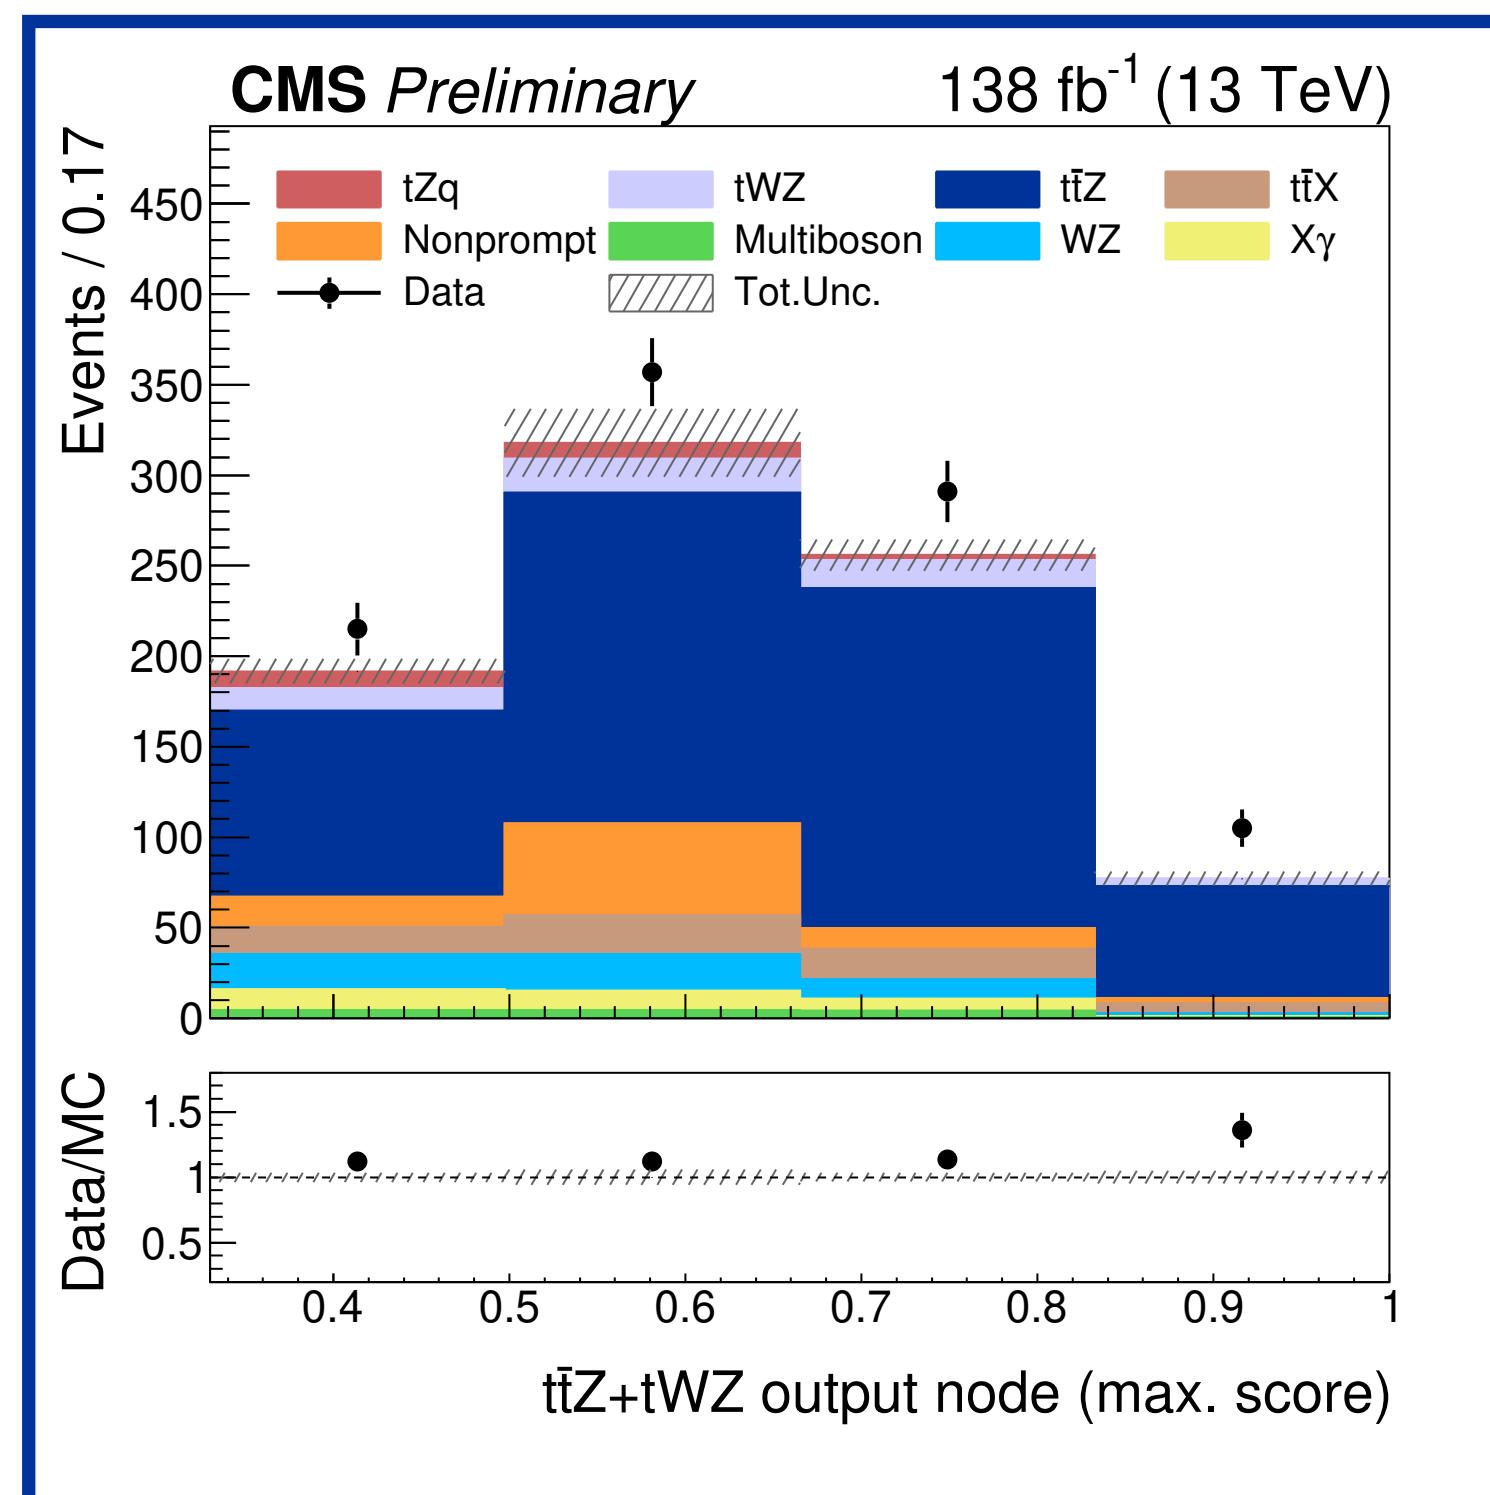

ICHEP
2024

- Signal region with three leptons (e or μ), ≥ 2 jets, ≥ 1 b-tagged jet
- Nonprompt lepton contribution** is estimated from data, **WZ** and other smaller backgrounds from simulation

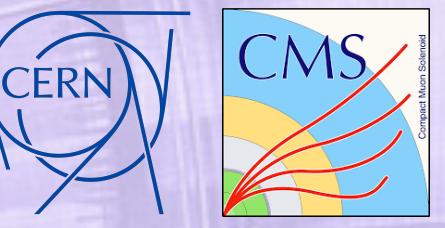

Signal/background discrimination

- Neural network (multi-class classifier) to disentangle different signals and backgrounds
 - 3 output nodes for $t\bar{t}Z+tWZ$, tZq , and background (maximum-score splitting to build fit categories)

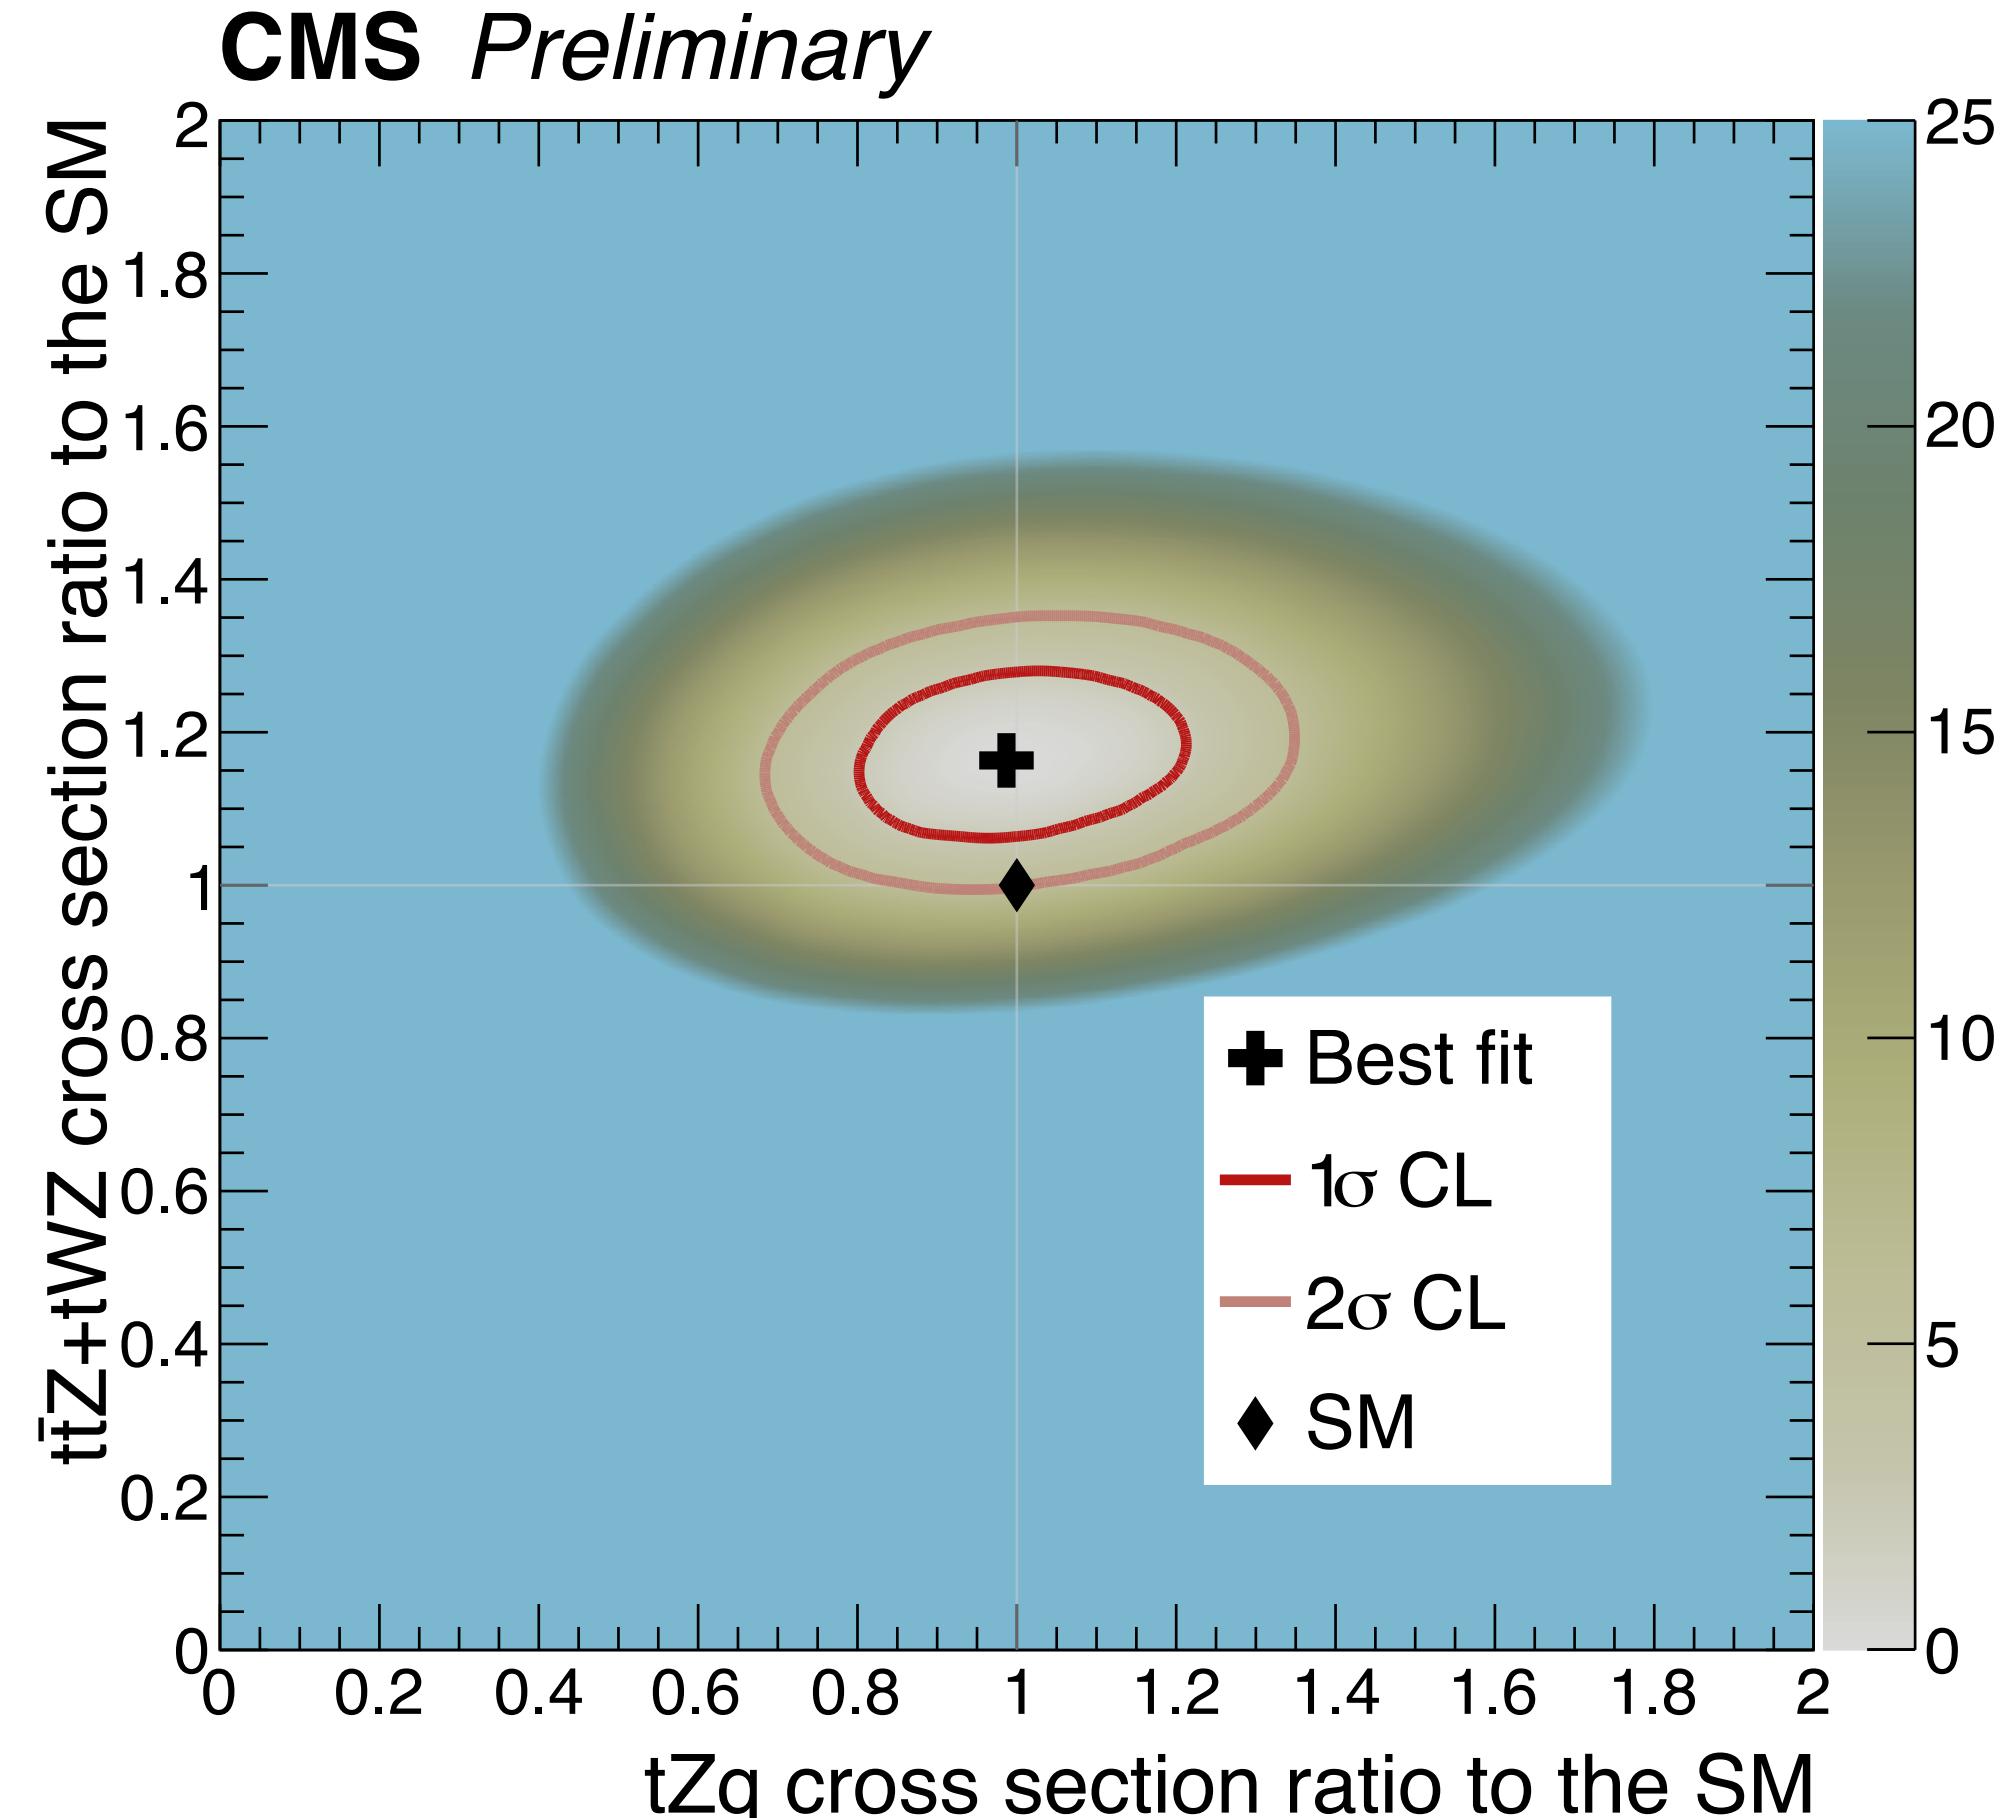

Inclusive measurement

ICHEP
2024

- Simultaneous fit to 3 max-score output nodes (SR) and two CRs
- Profiled likelihood fit
- Limited by statistics, main syst. uncertainties on background modelling and b tagging
- Inclusive cross sections measured to be:

$$\sigma_{t\bar{t}Z+tWZ} = 1.14 \pm 0.07 \text{ pb}$$

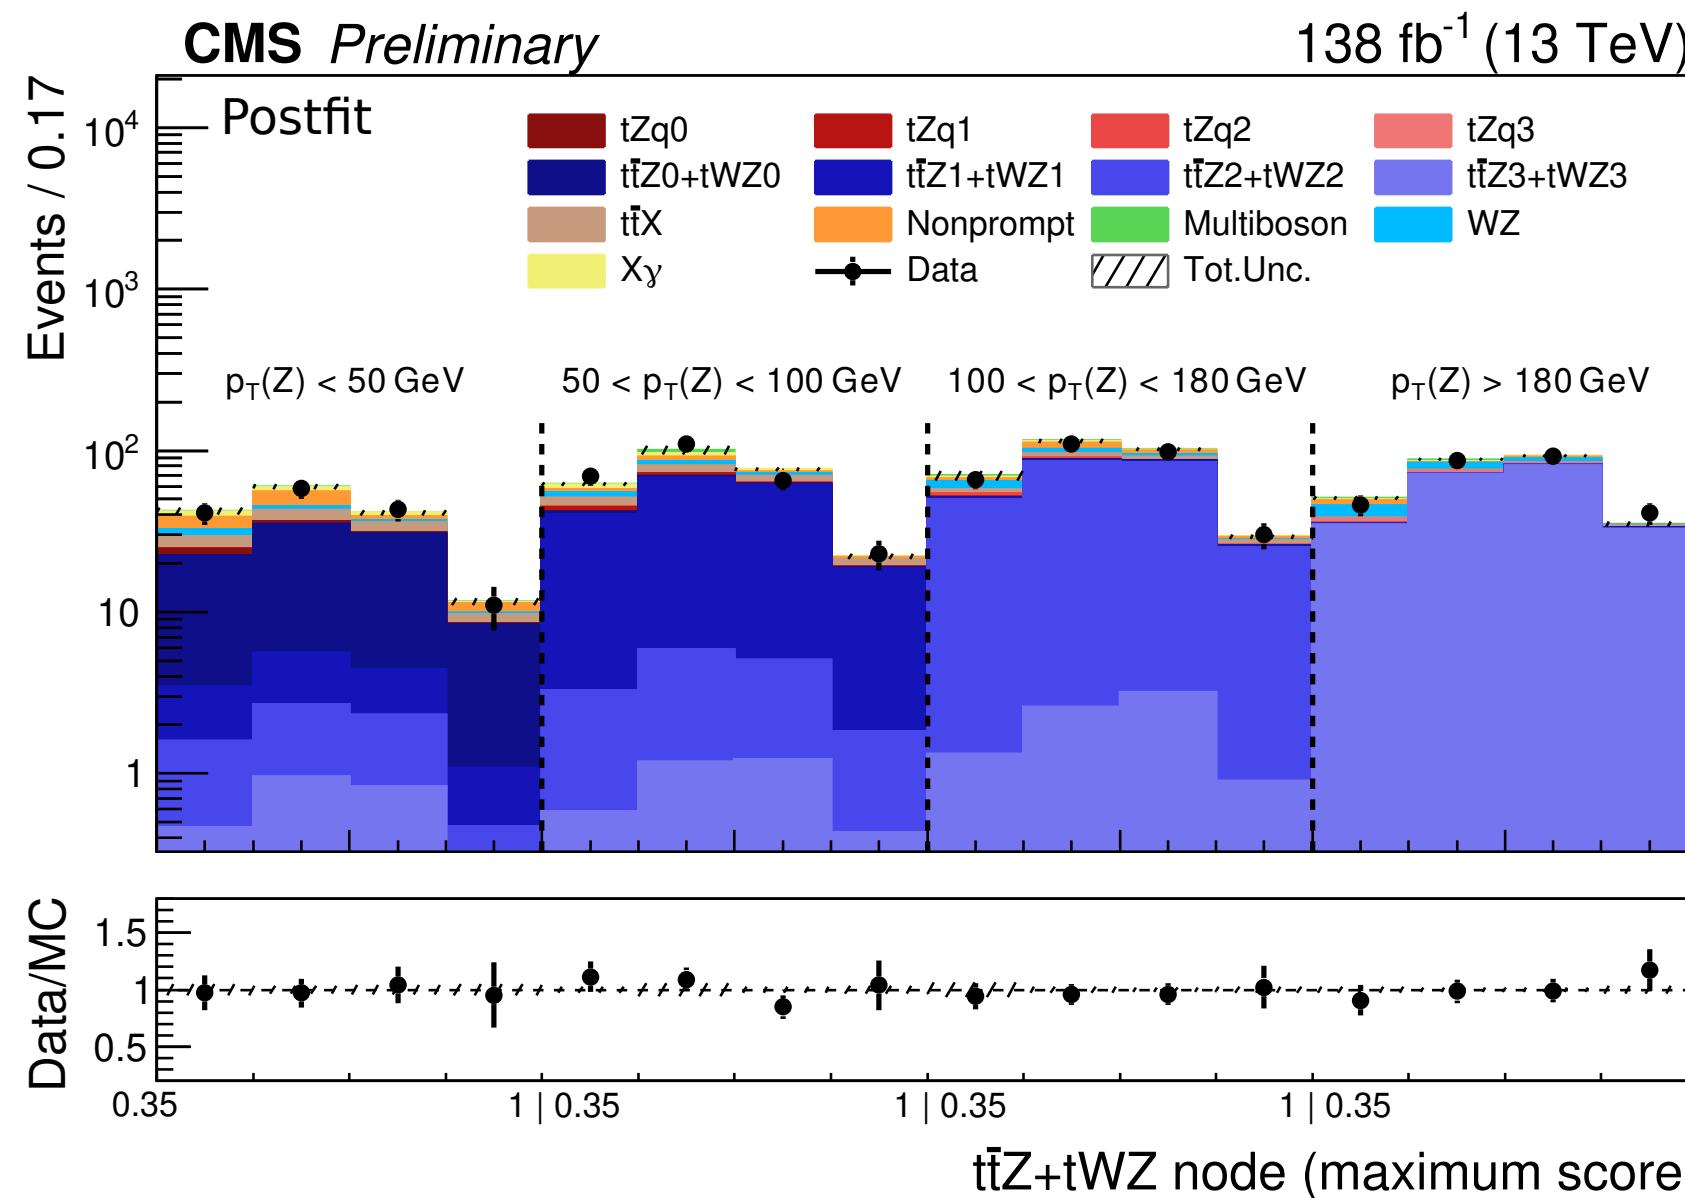

$$\sigma_{tZq} = 0.89 \pm 0.10 \text{ pb}$$

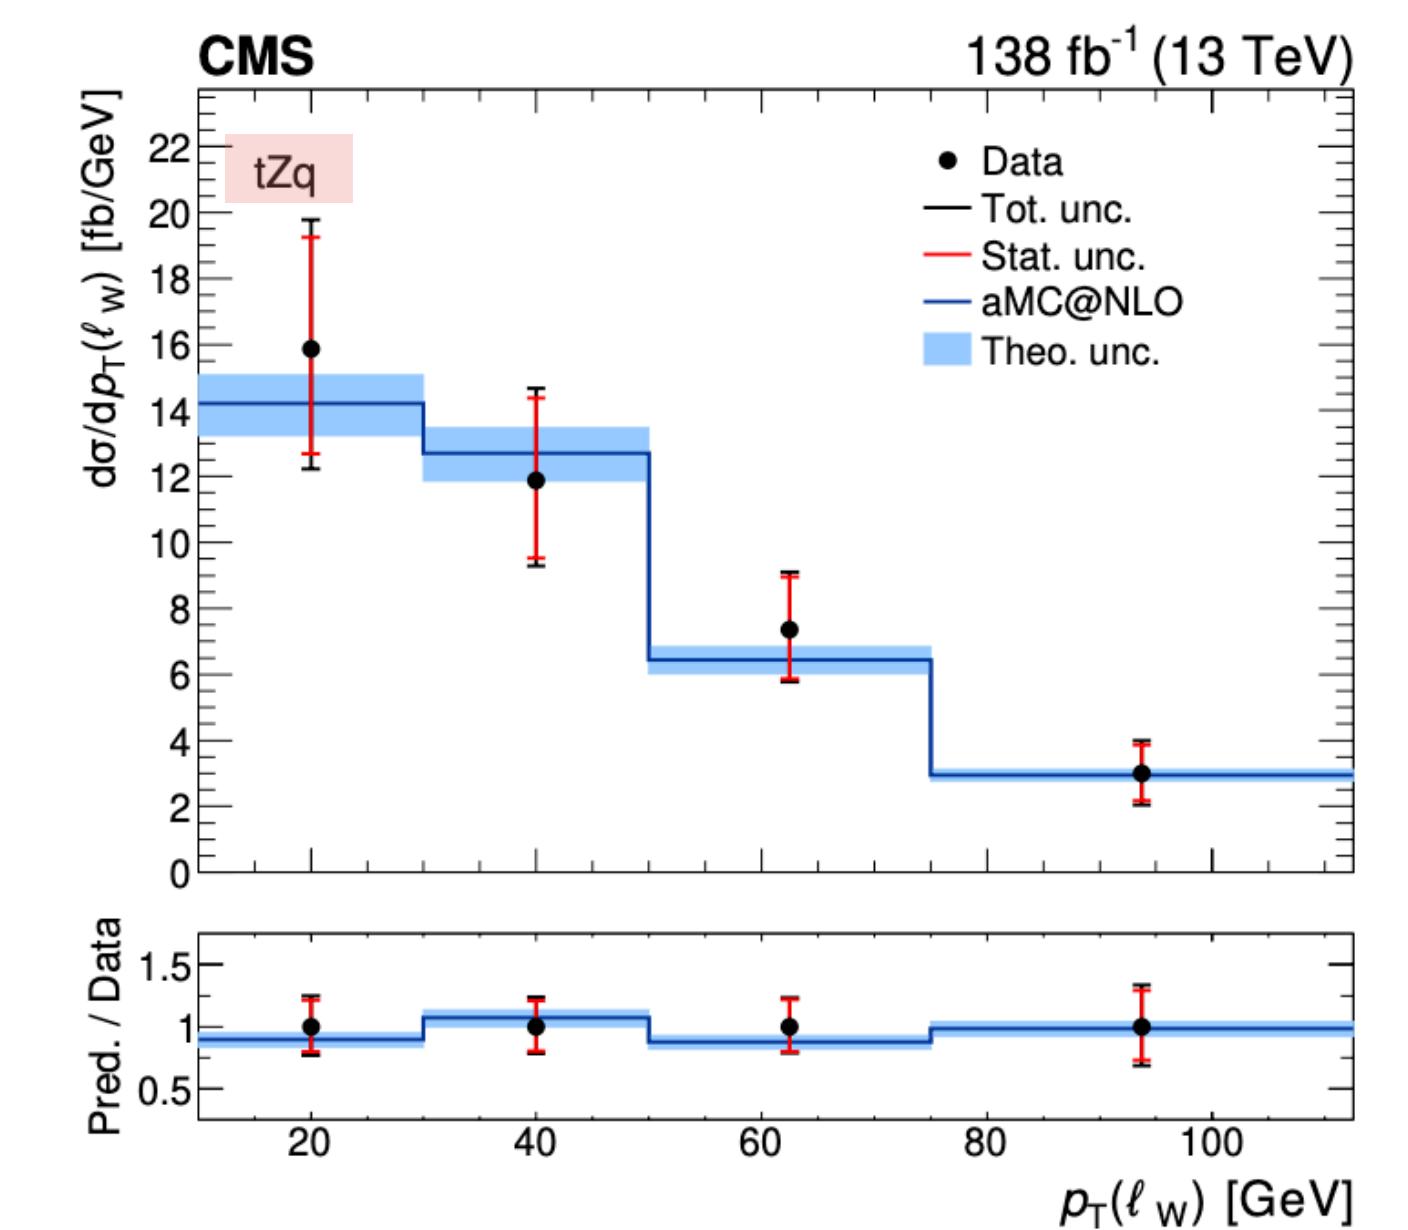

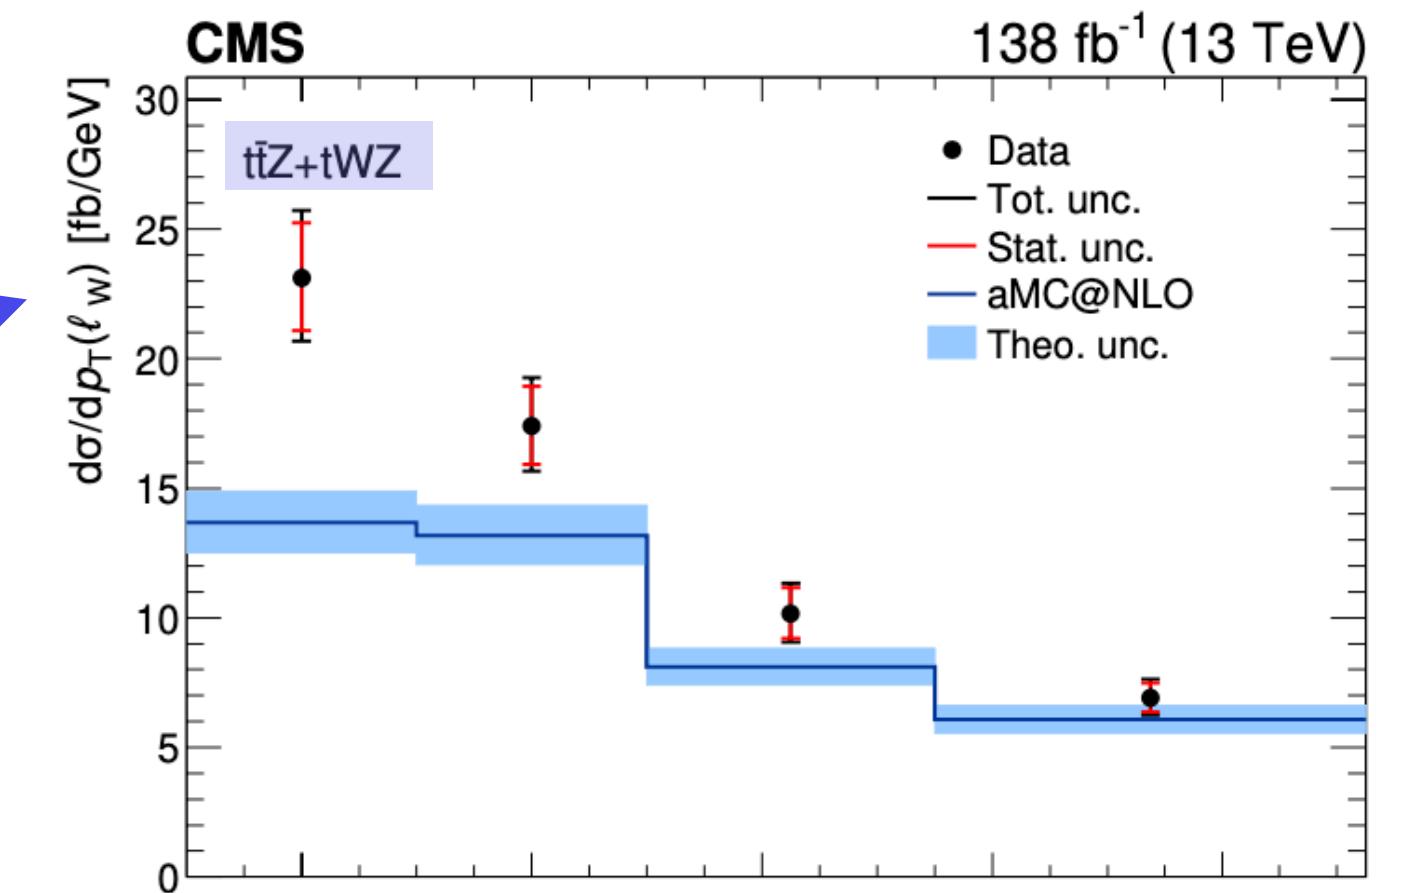

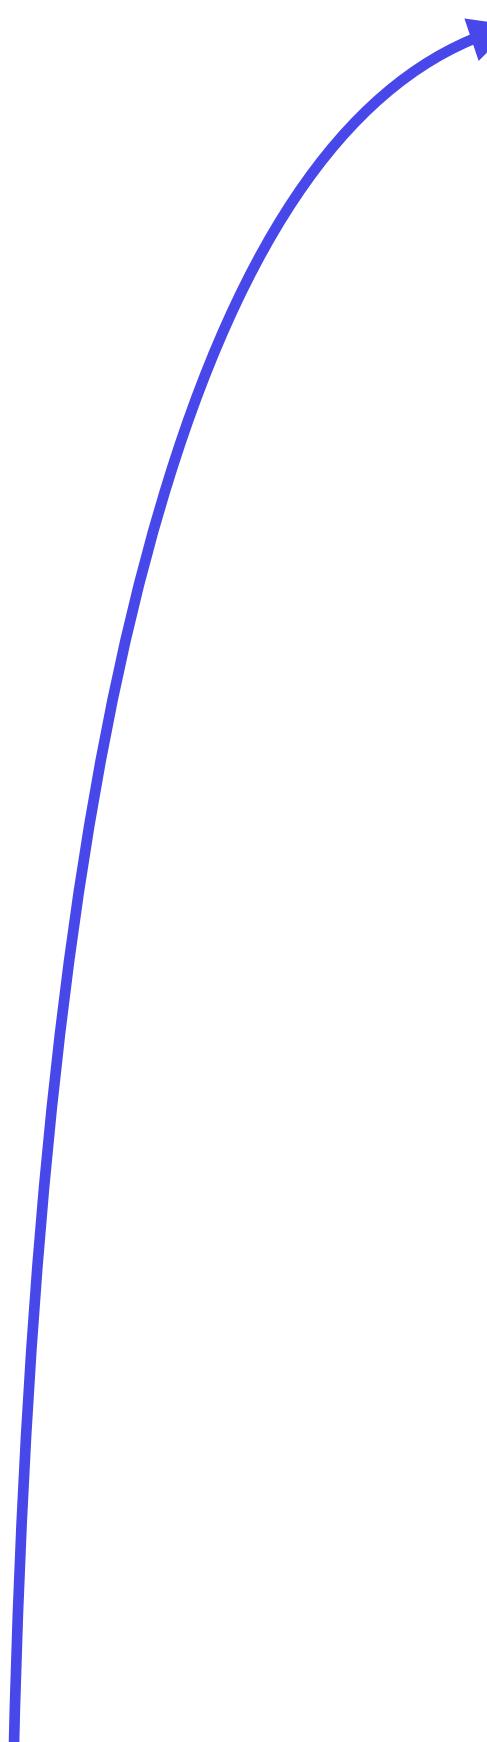

consistent with SM for tZq ,
slight excess for $t\bar{t}Z+tWZ$

Differential measurements

- Cross sections measured as function of lepton and Z observables
- Maximum likelihood unfolding

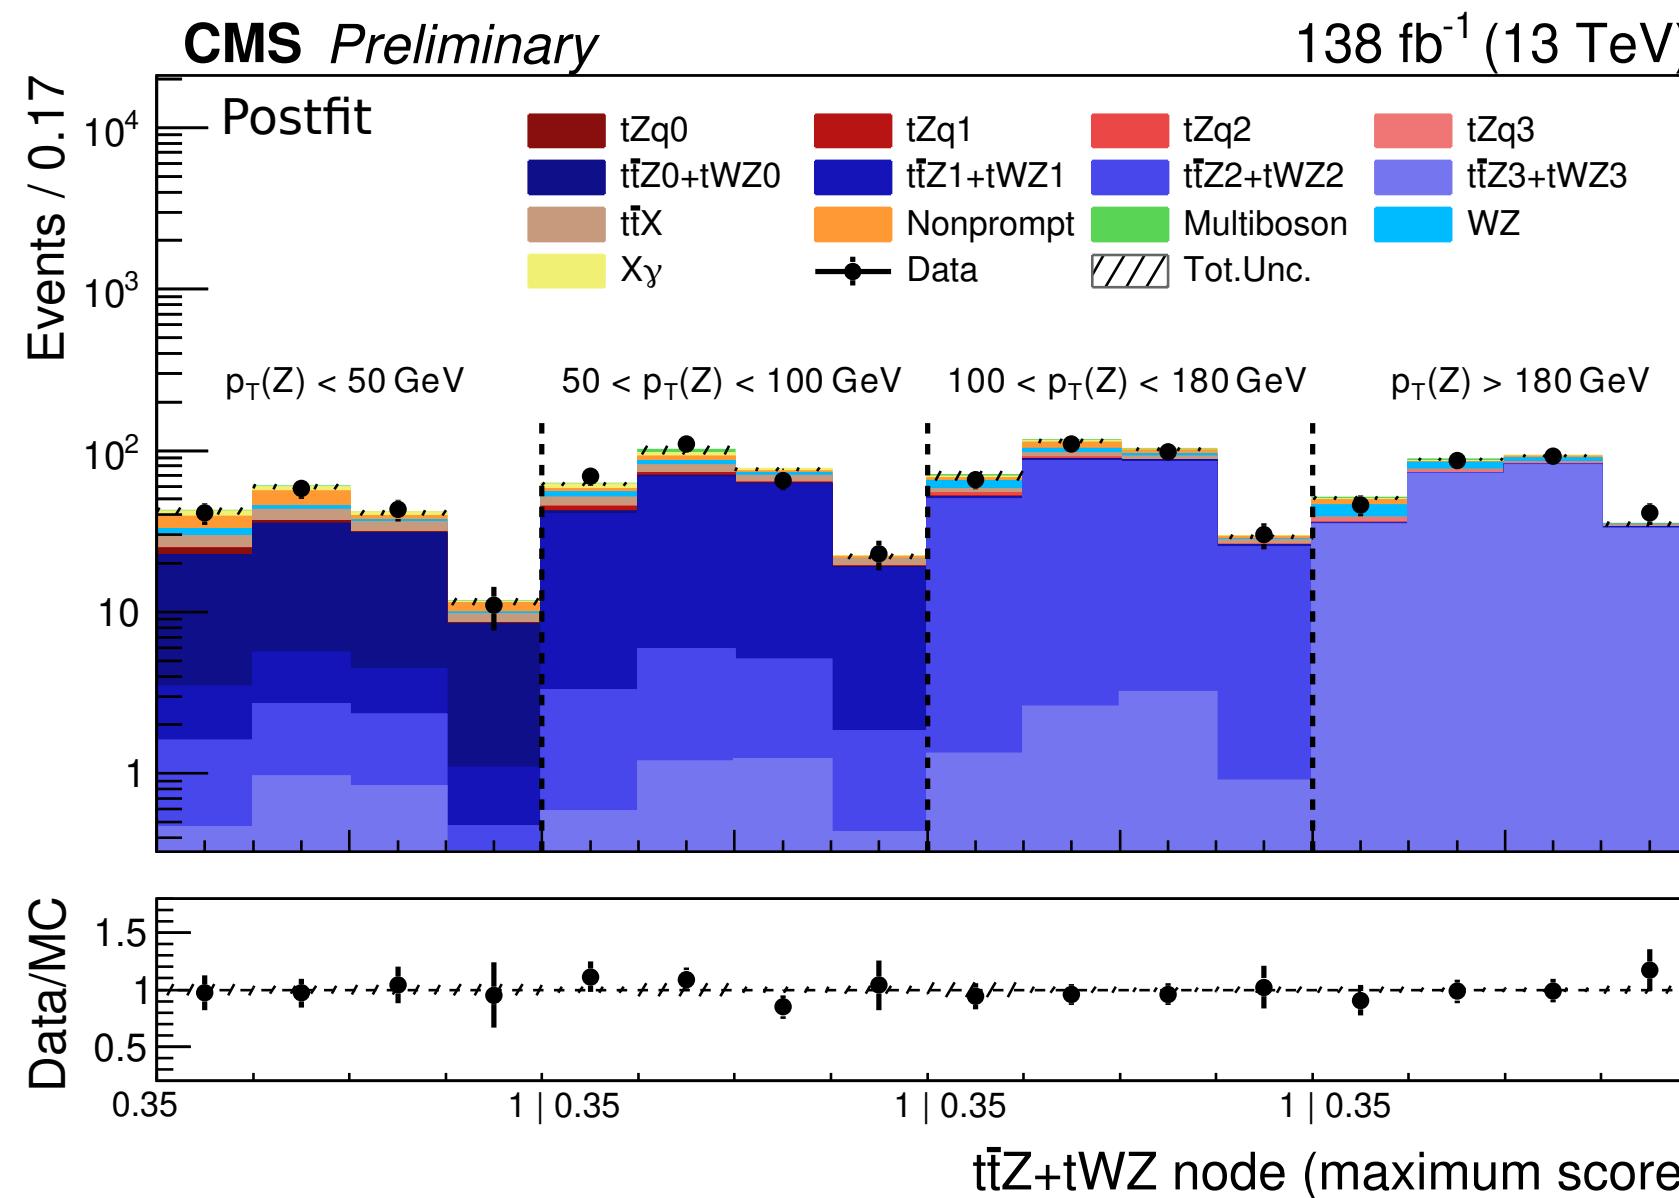

- Measurements compared to predictions from aMC@NLO
- Good agreement overall for $t\bar{Z}q$, excess for $t\bar{t}Z+tWZ$ at low lepton p_T

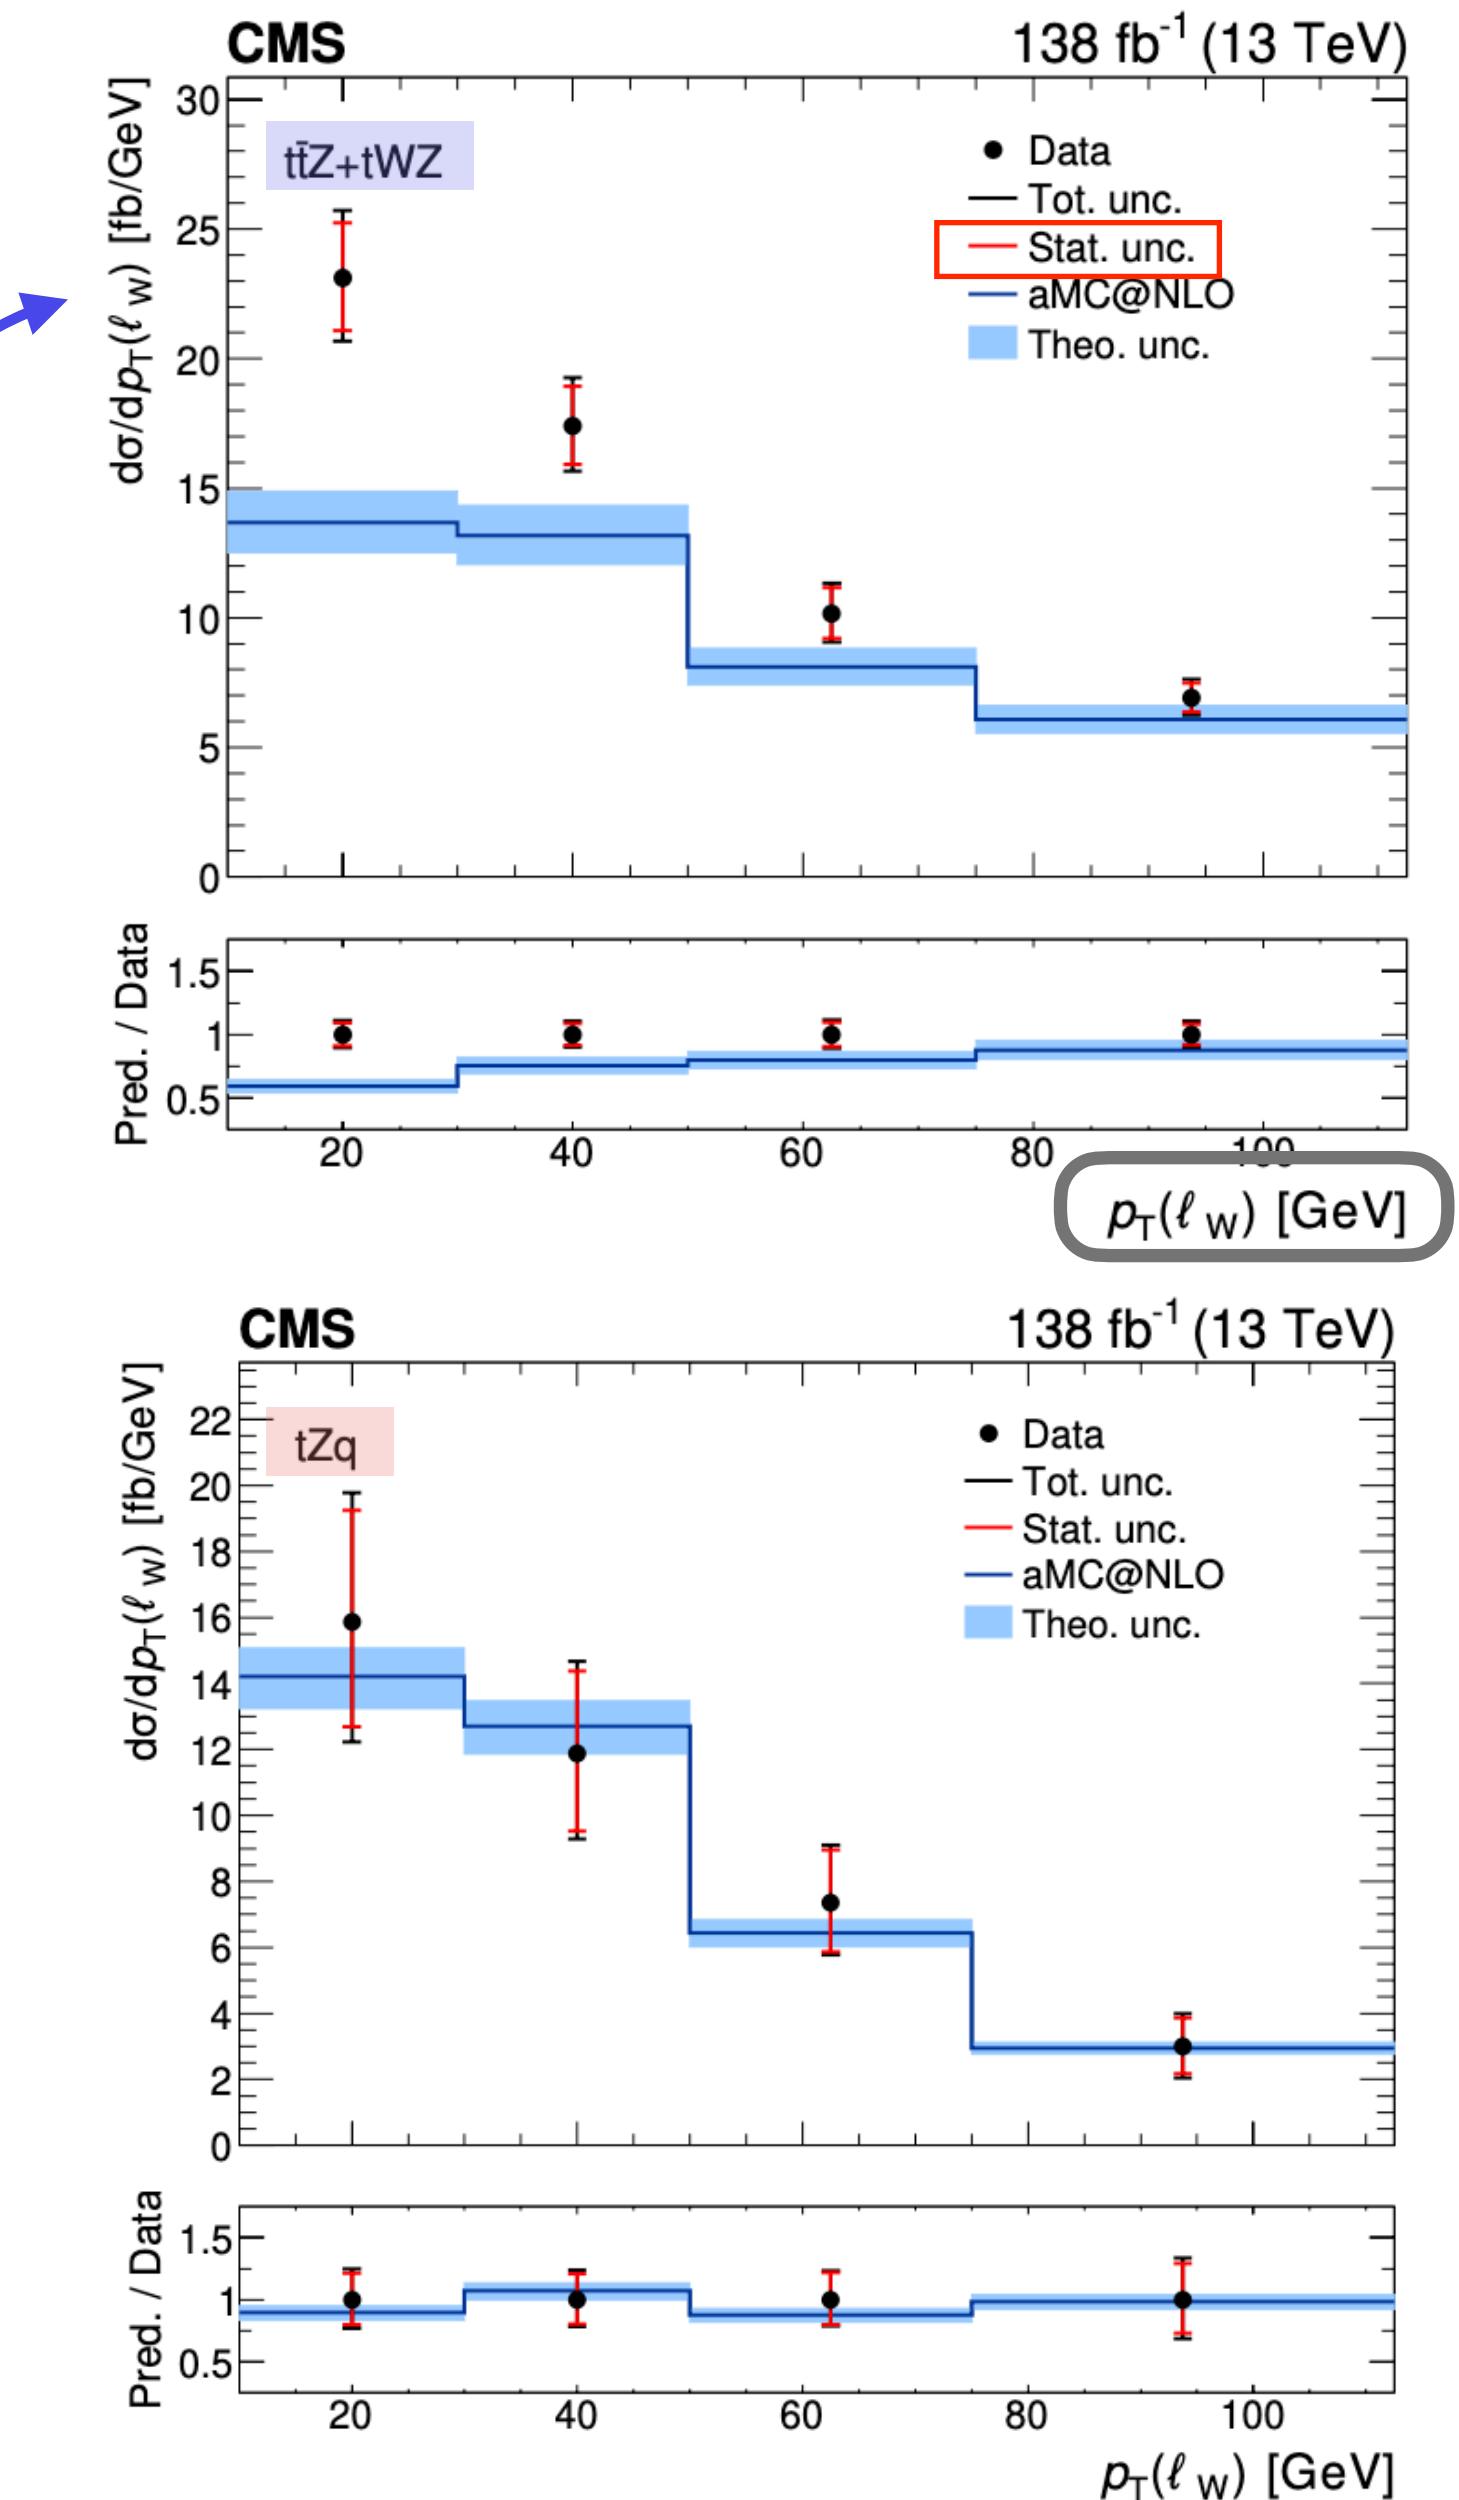

Differential measurements

- Cross sections measured as function of lepton and Z observables
- Maximum likelihood unfolding

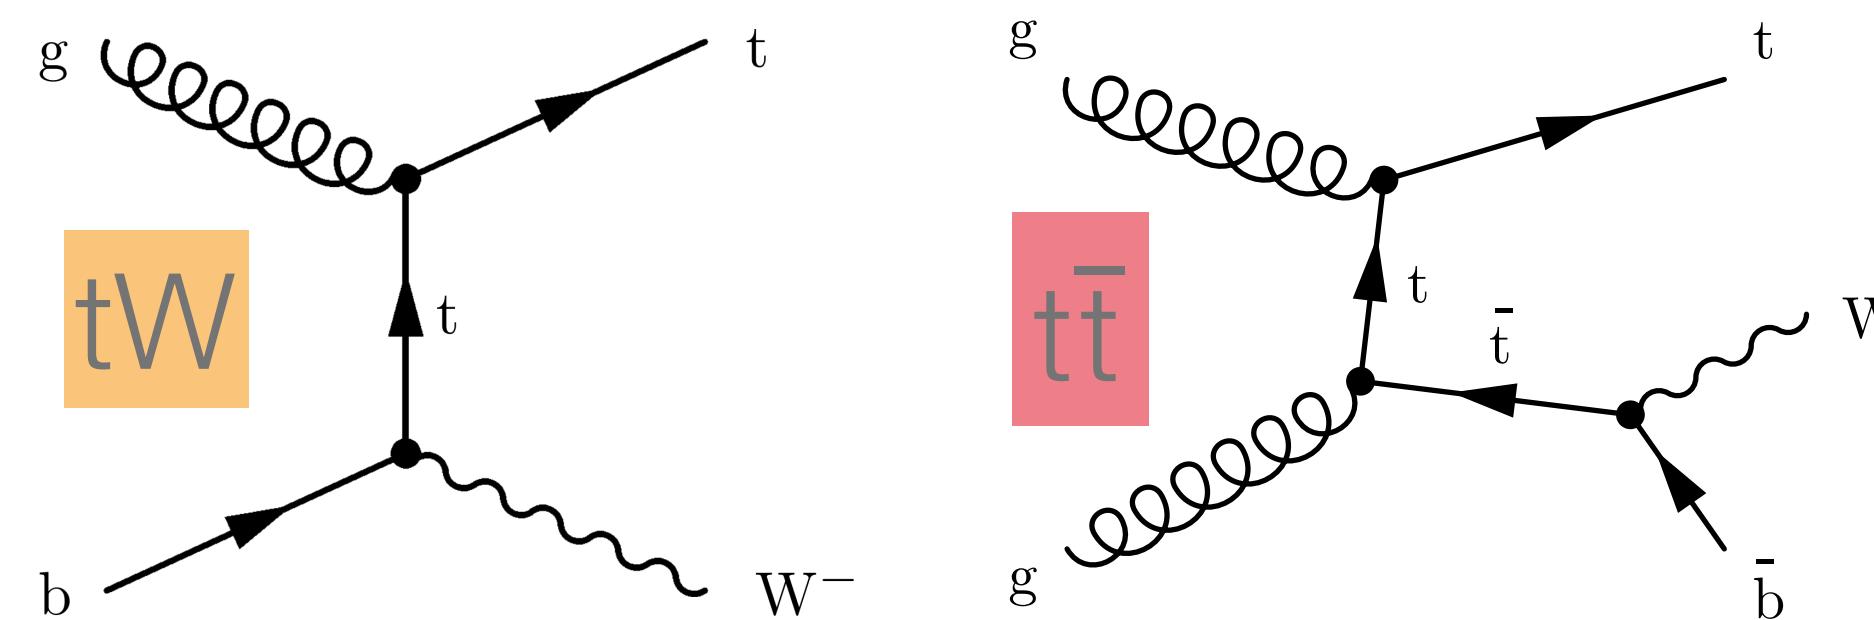

- Measurements compared to predictions from aMC@NLO
- Good agreement overall for $t\bar{Z}q$, excess for $t\bar{t}Z+tWZ$ at low lepton p_T

**First simultaneous measurement of these processes,
useful for theory and EFT interpretations**

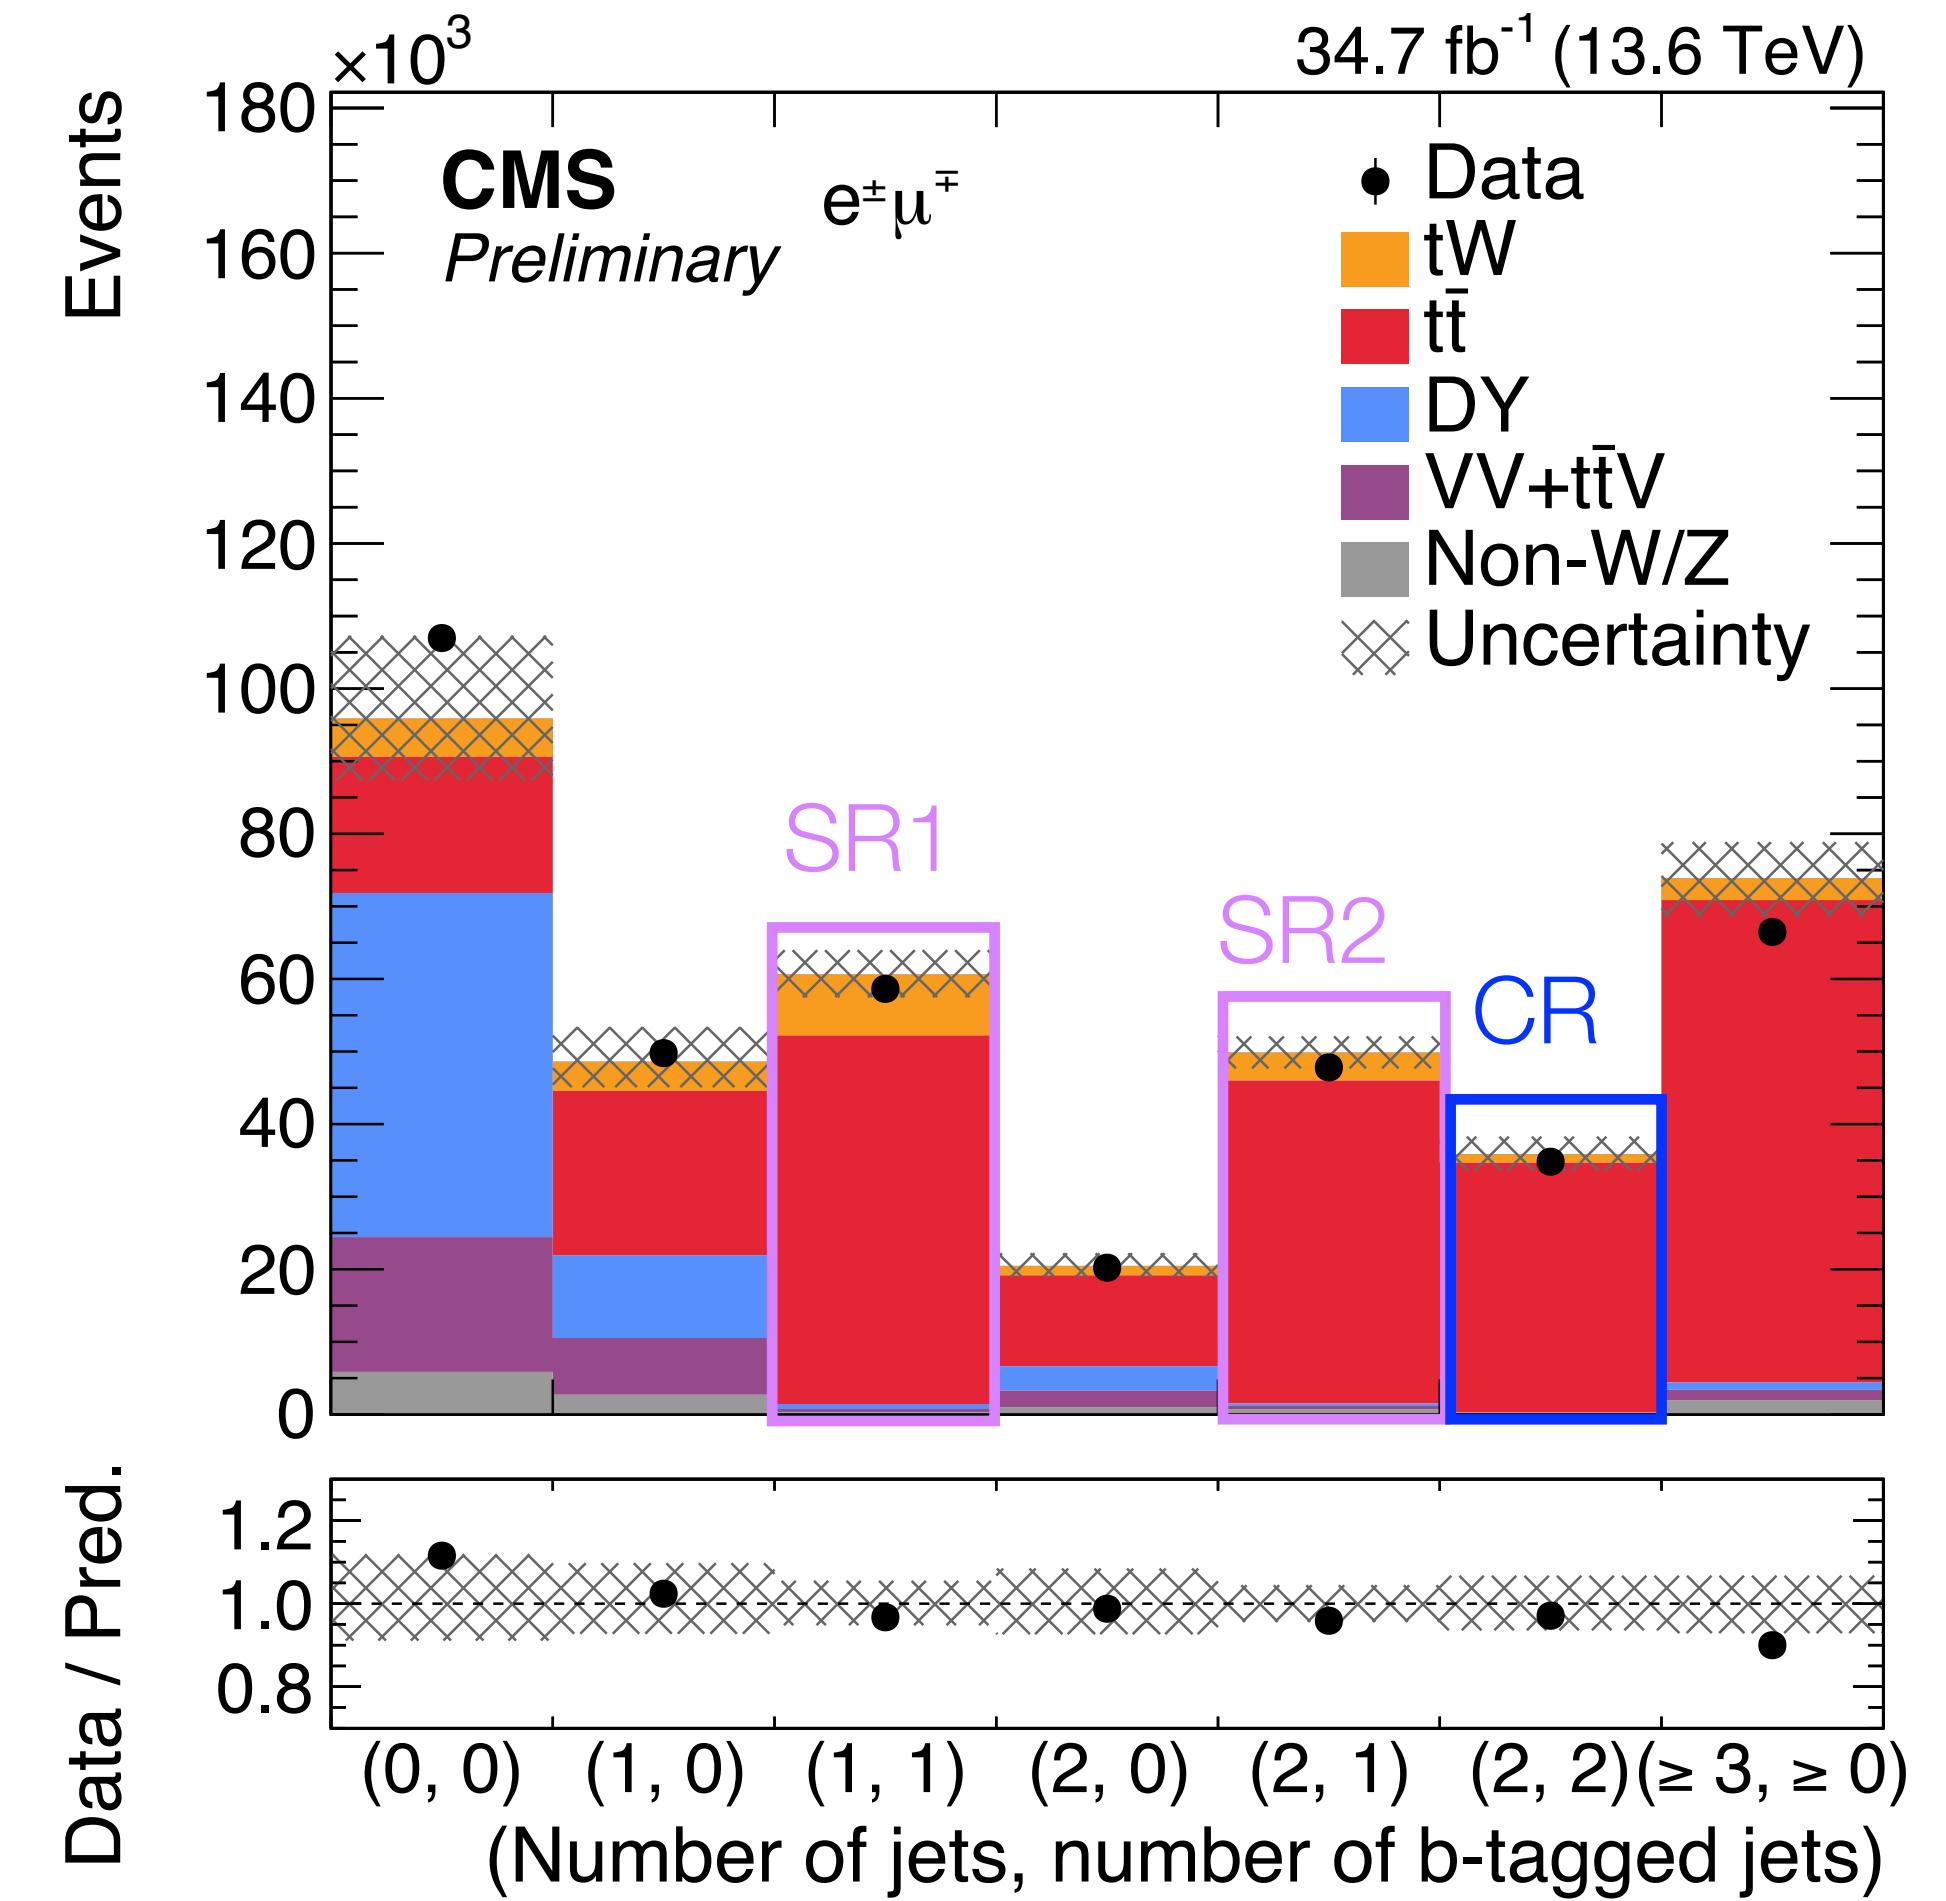

The tW process at the LHC Run 3

- First tW measurement at 13.6 TeV, using full 2022 dataset (34.7 fb^{-1})

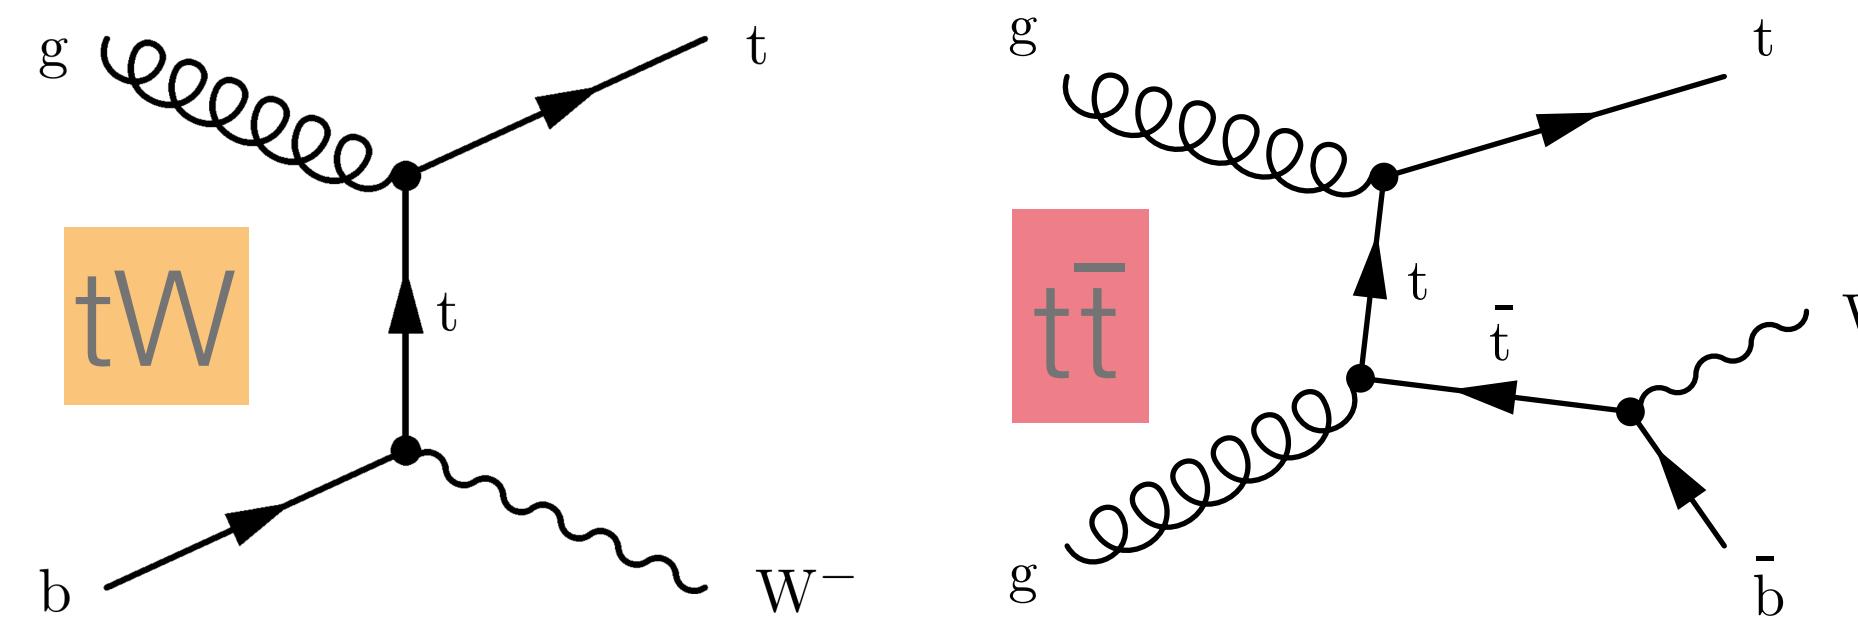

- Focusing on $e\mu$ final states
- Two **SRs** and **CR** defined based on number of jets and b jets

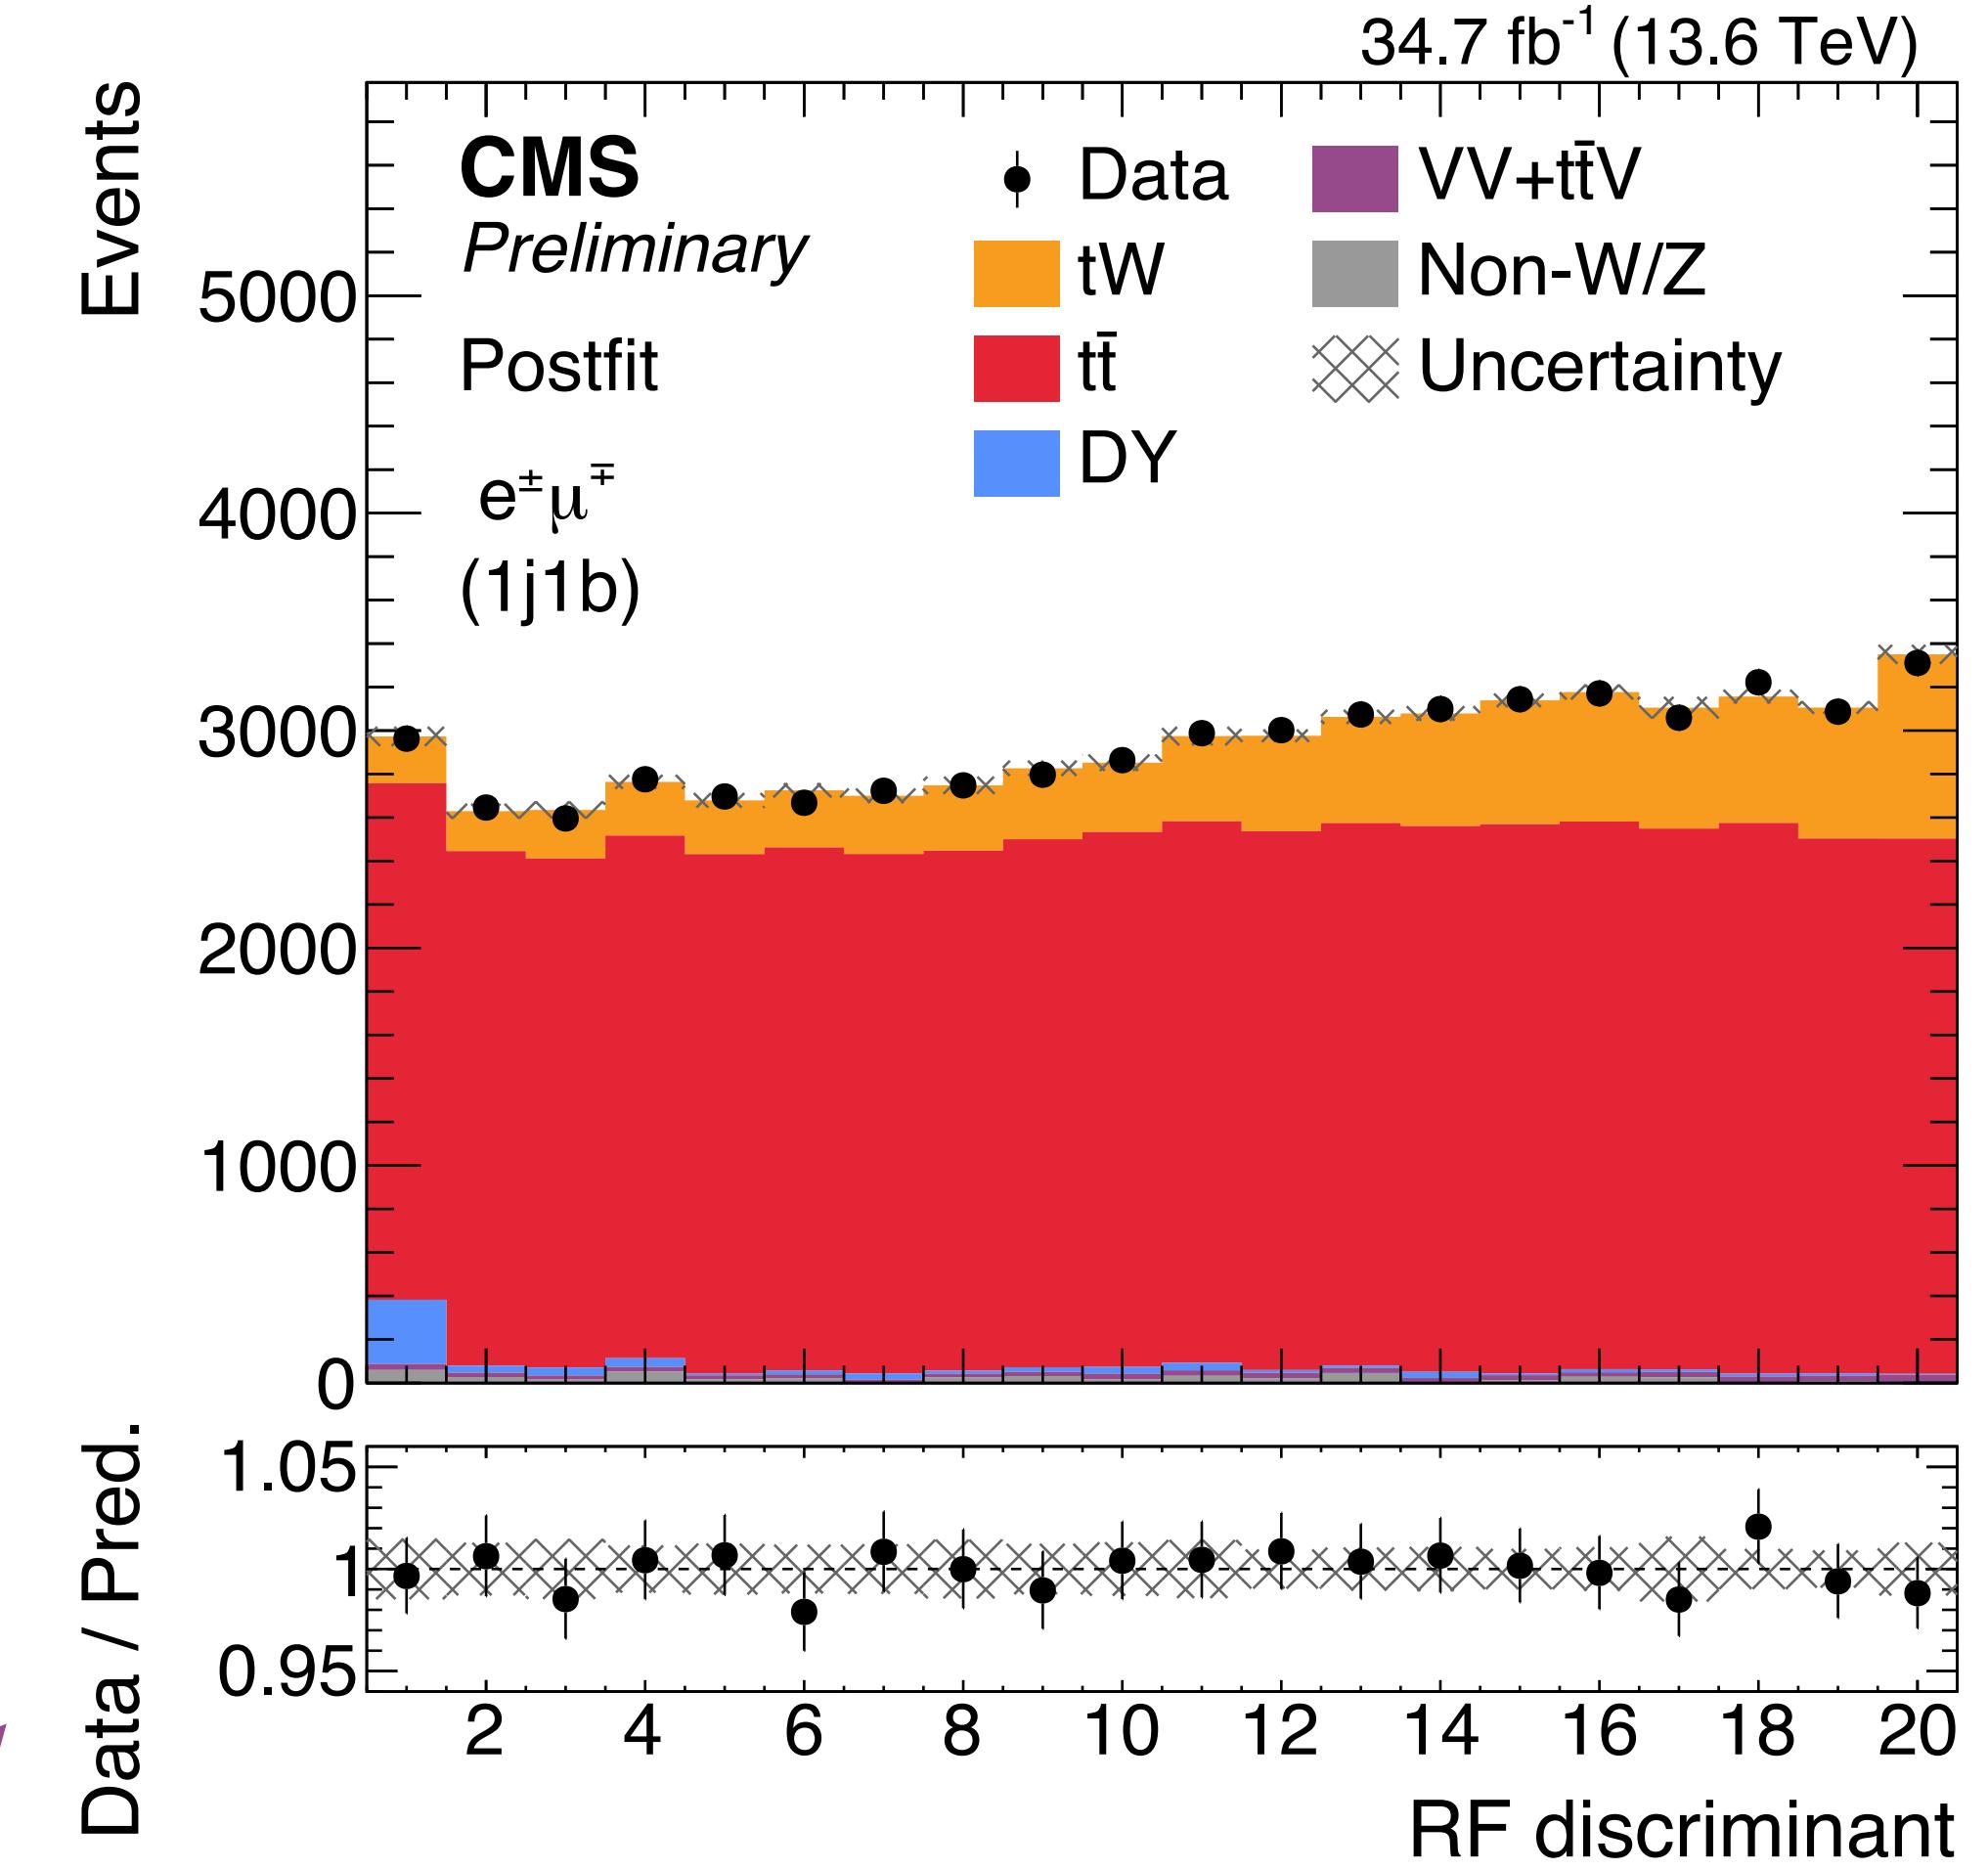

The tW process at the LHC Run 3

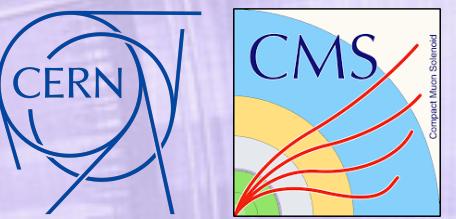

- First tW measurement at 13.6 TeV, using full 2022 dataset (34.7 fb^{-1})

- Focusing on $e\mu$ final states
- Two SRs and CR defined based on number of jets and b jets
- MVA classifiers (Random Forests) to separate tW from irreducible ttbar background in SRs

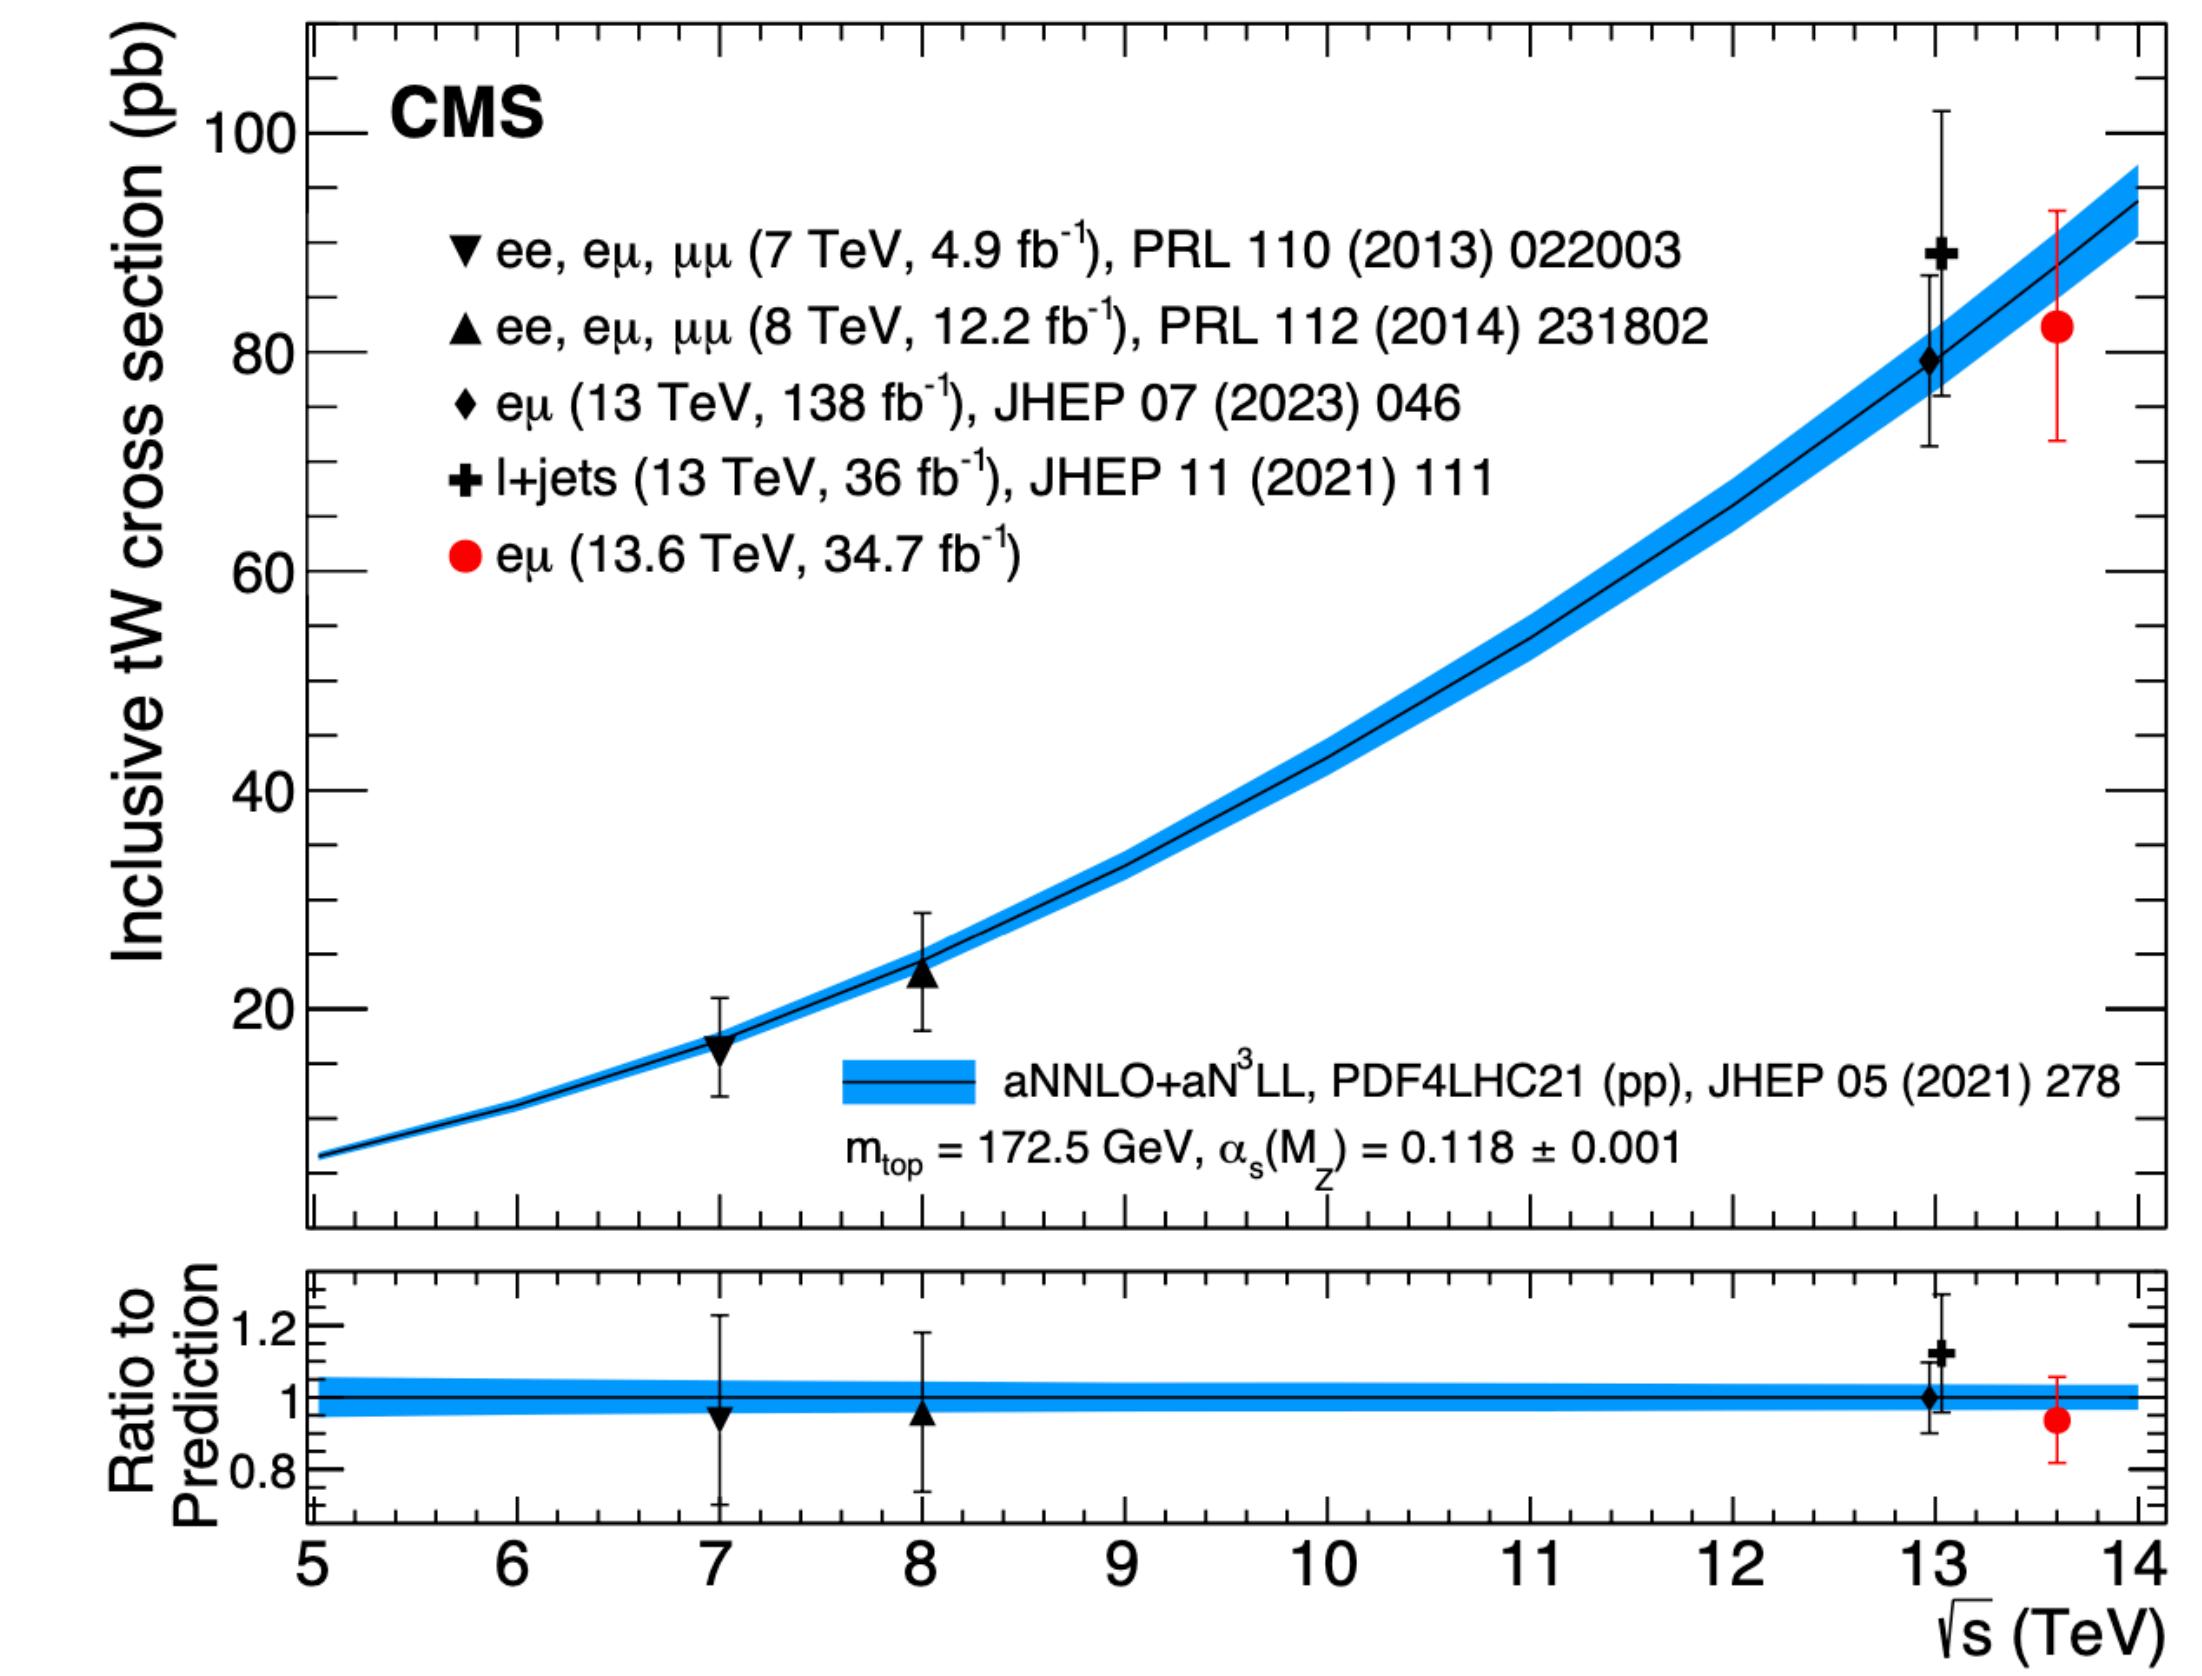

Inclusive tW cross section at 13.6 TeV

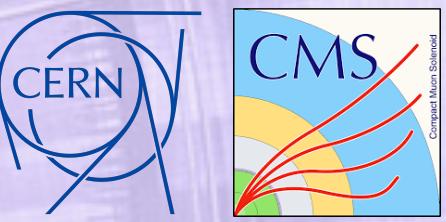

ICHEP
2024

- Result: $\sigma_{tW} = 84.1 \pm 2.1(\text{stat.})^{+9.8}_{-10.2}(\text{syst.}) \pm 3.3(\text{lum}) \text{ pb}$

- Compatible with SM N³LO prediction
- Limited by systematic uncertainties:
 - mainly jet energy scale, b tagging and background modelling

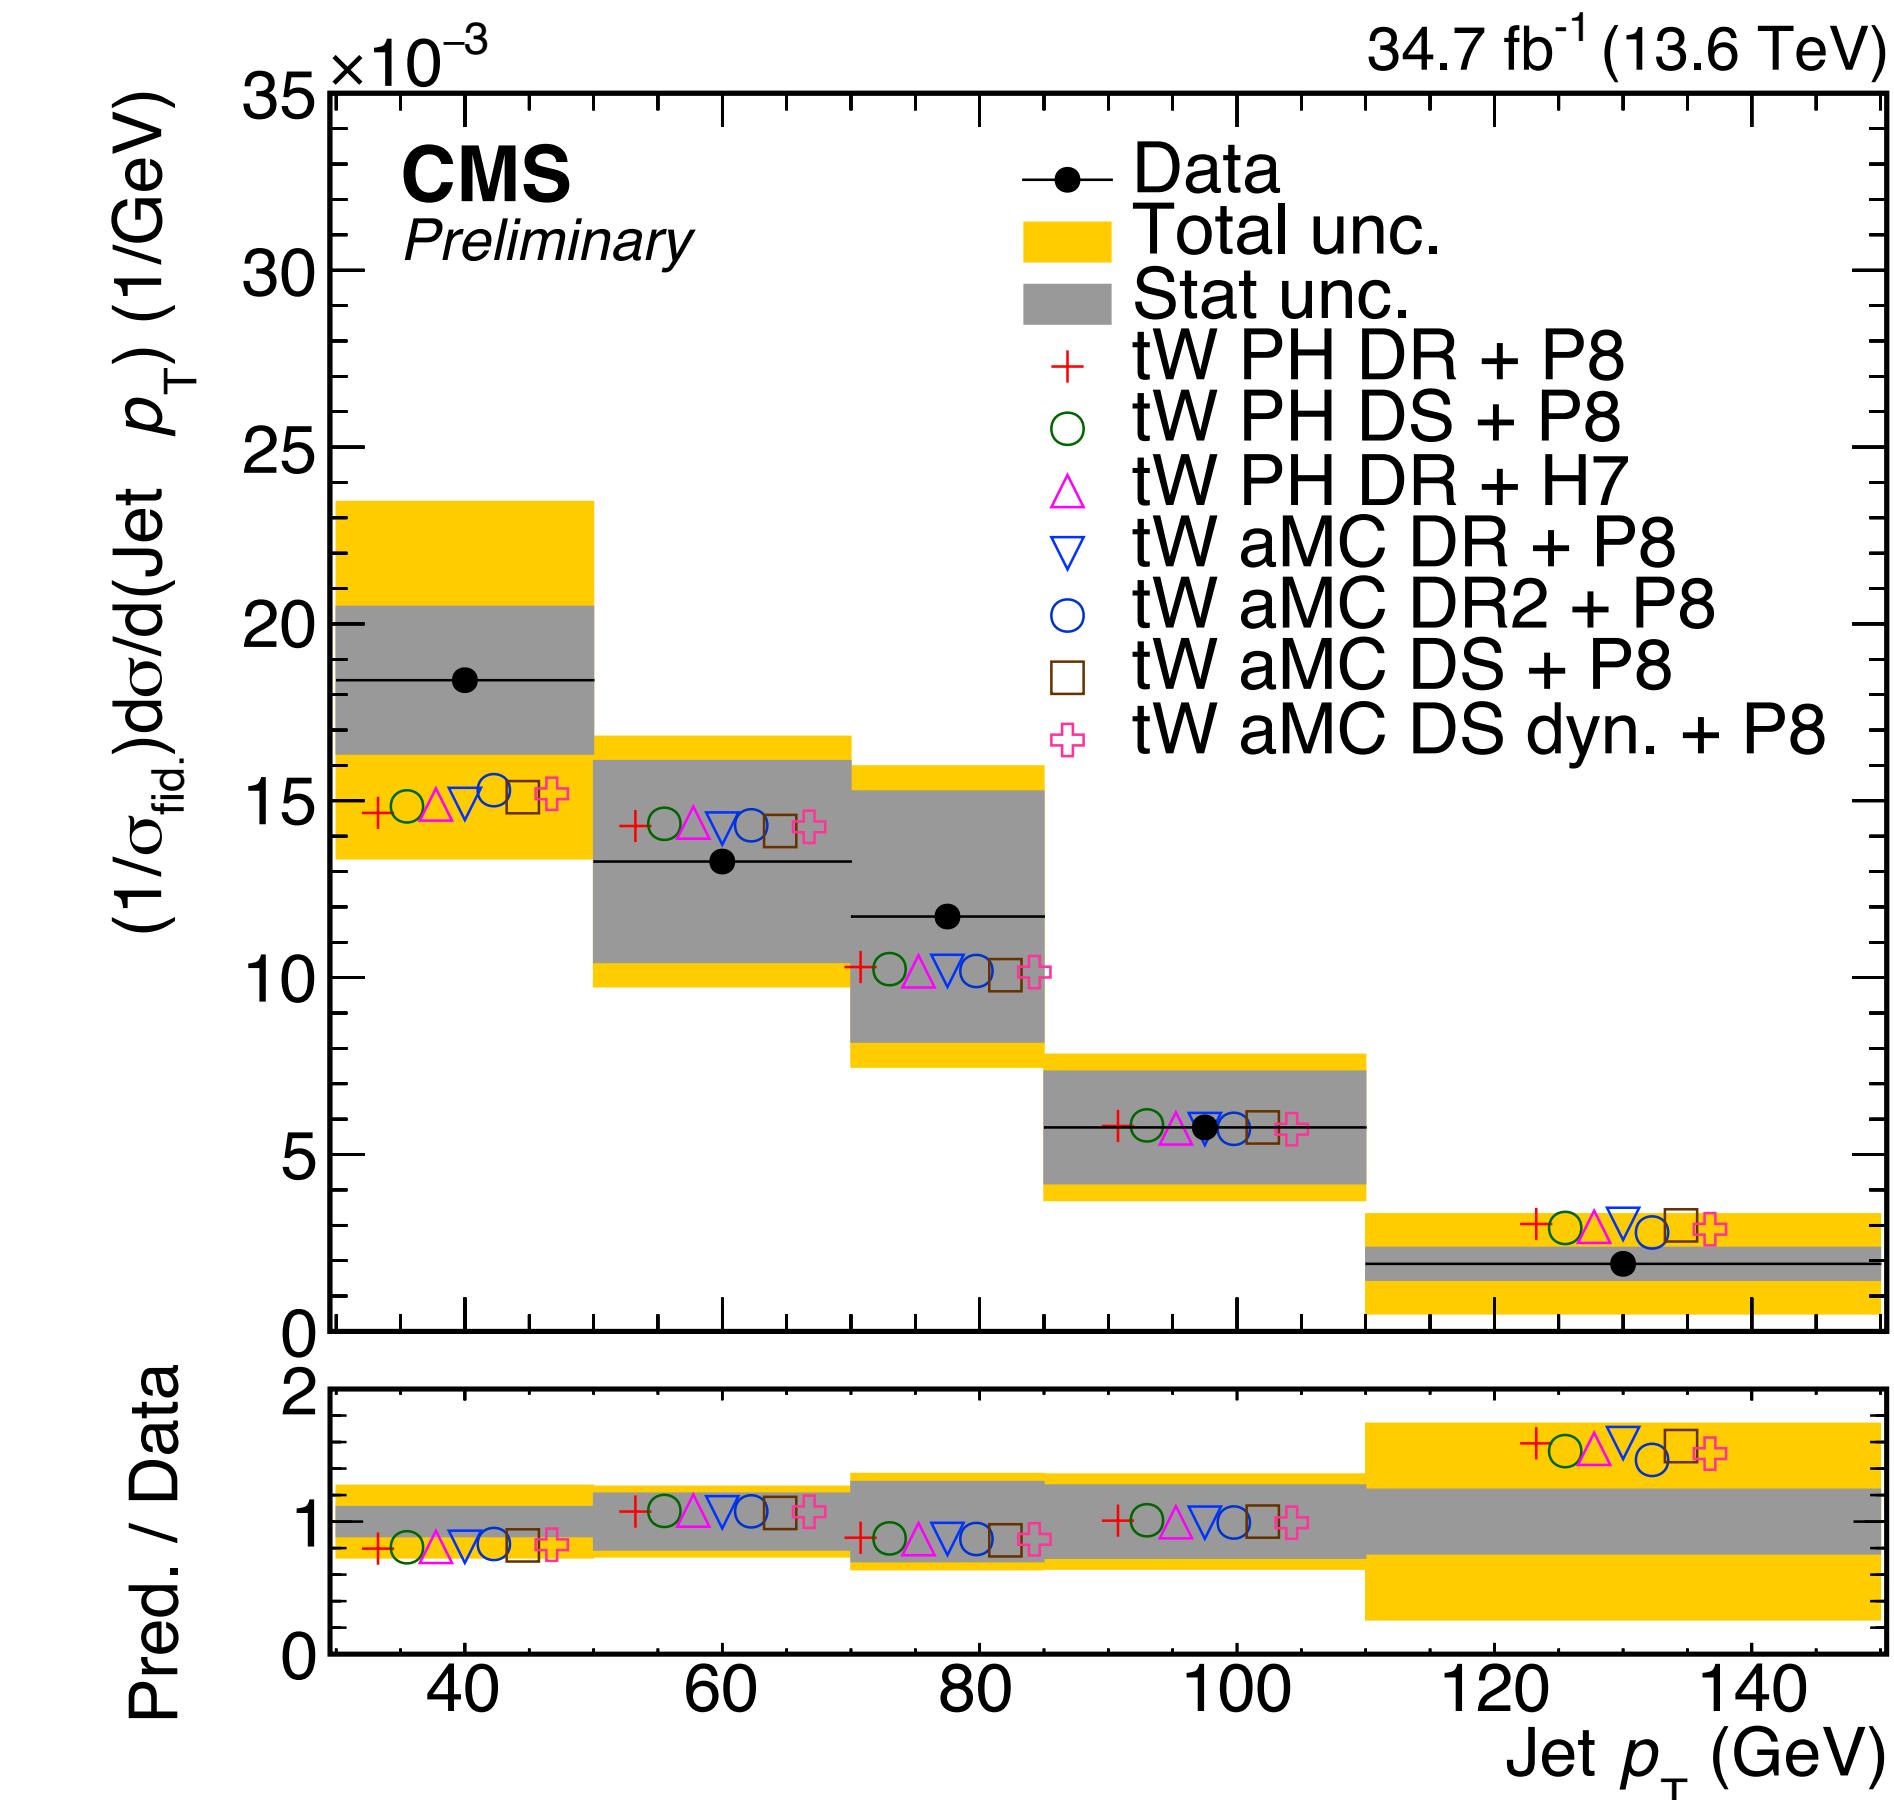

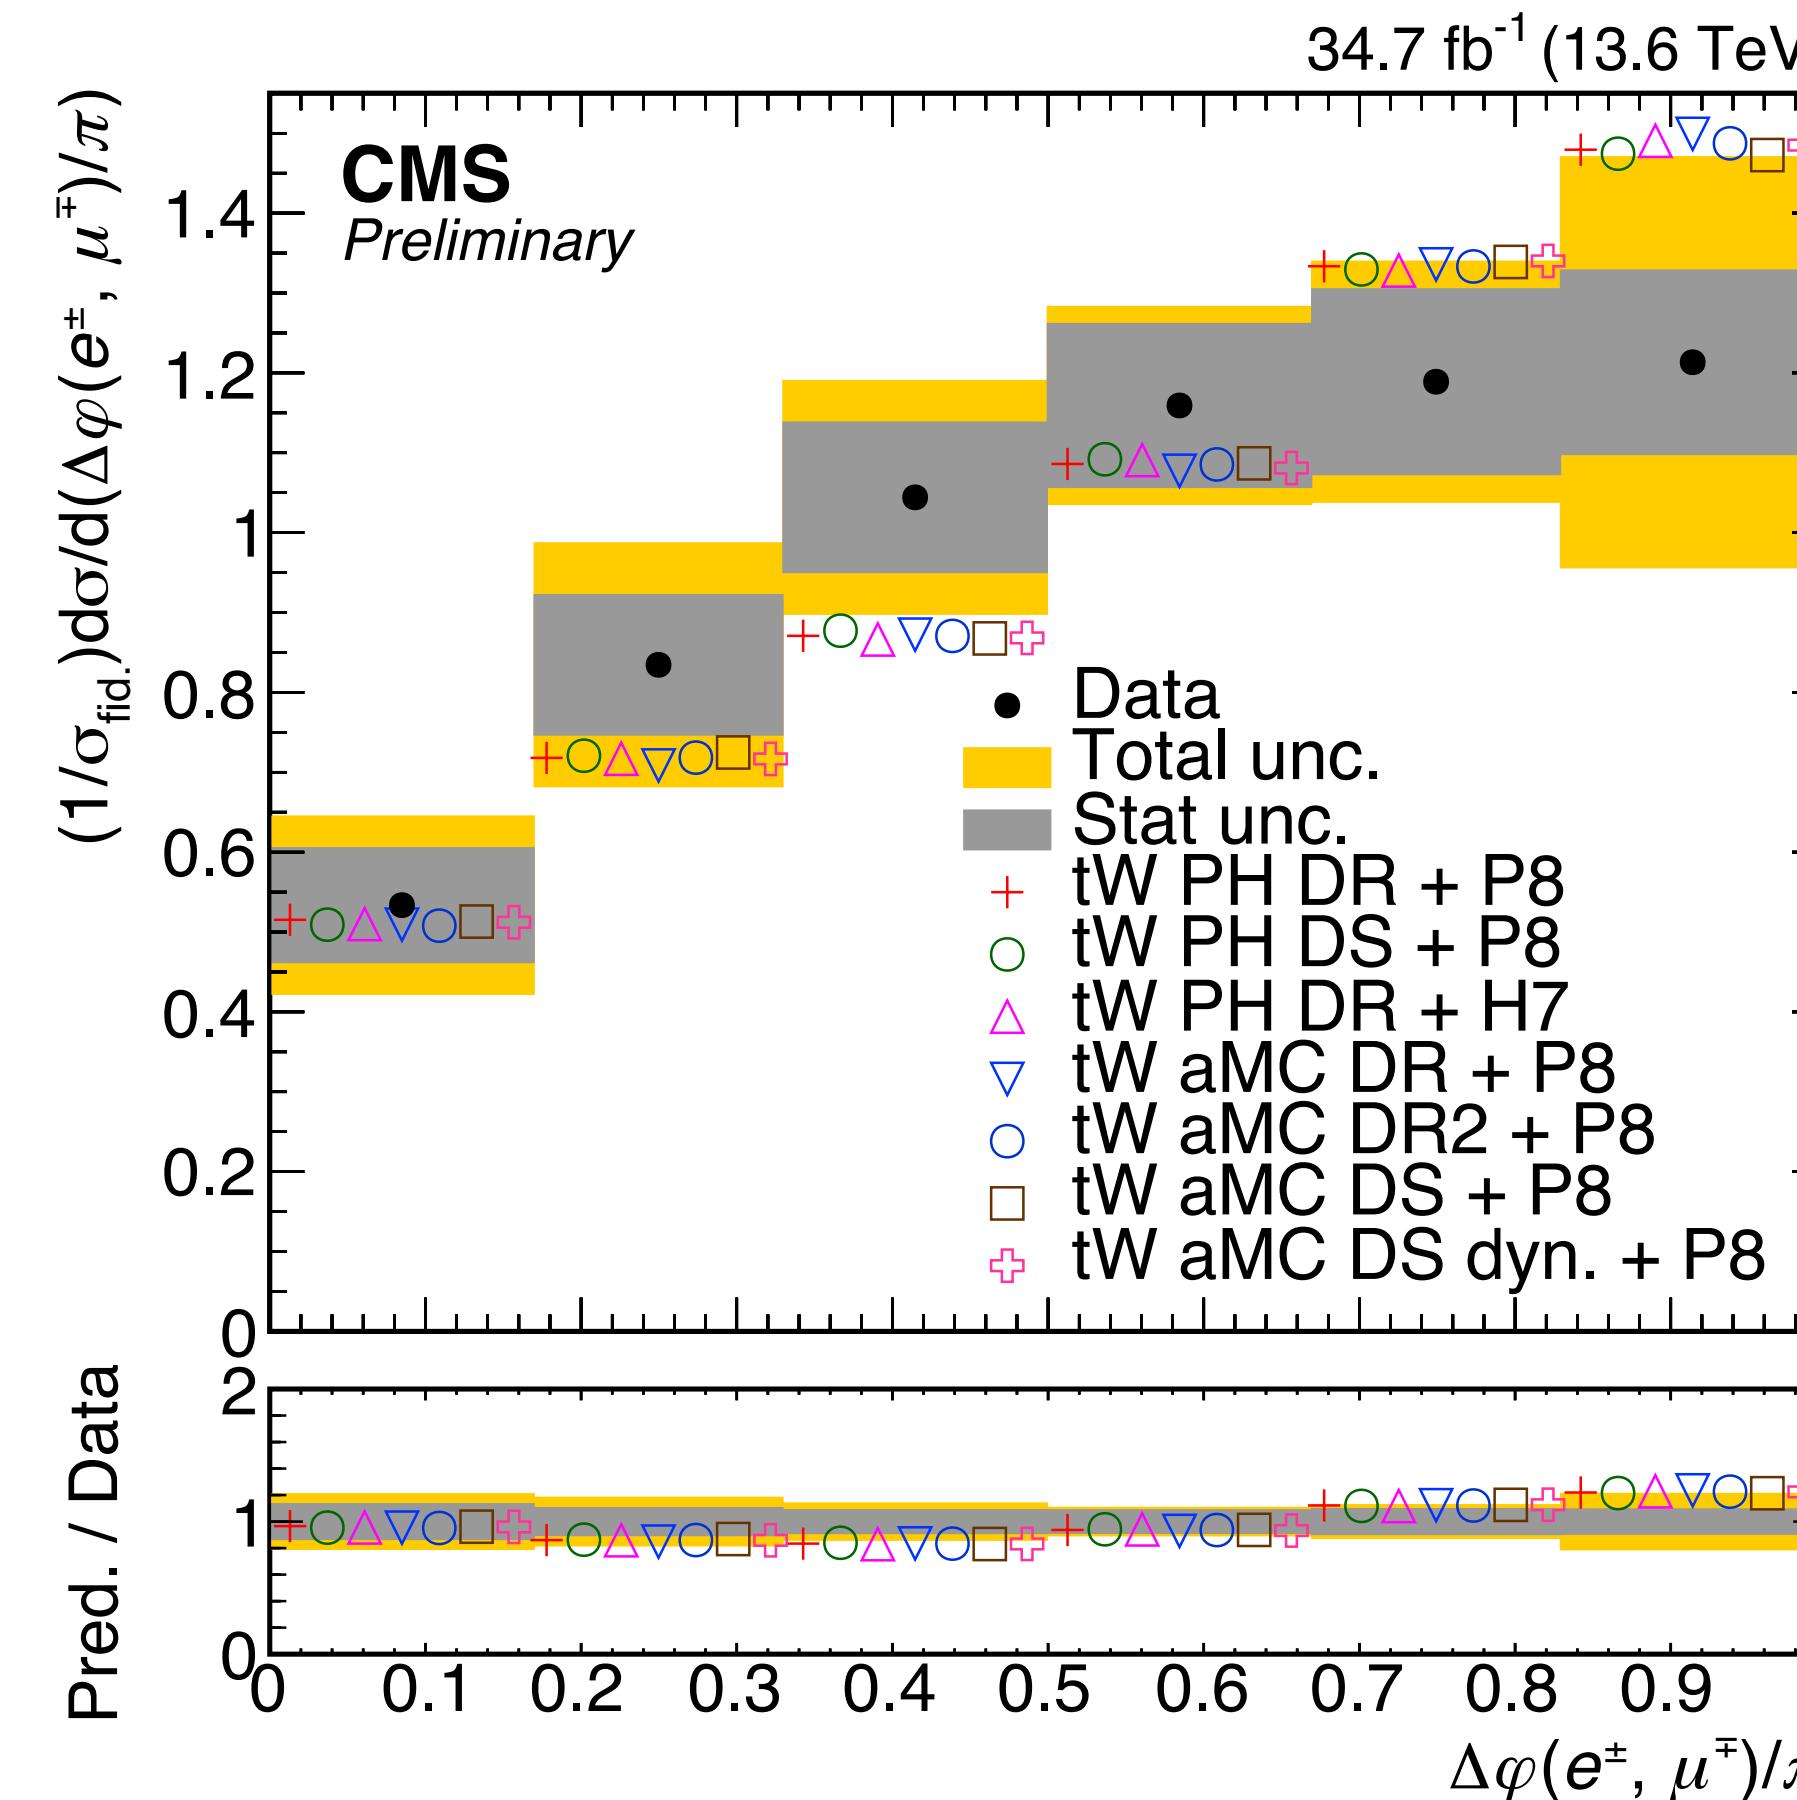

Differential tW cross sections at 13.6 TeV

ICHEP
2024

- Differential cross sections measured in 1j1b region, with veto on jets with p_T 20-30 GeV
- Several jet and lepton observables unfolded to particle level using TUnfold [1]
- Good agreement with predictions from different generators, and different schemes for treating the interference between $t\bar{t}$ and tW

- Putting the SM to the test with processes involving top quark EW couplings
- Simultaneous measurements enhance sensitivity to BSM effects
- Run 2 and Run 3 data give access to **very rare top+V** processes
- **Shown today:**
 - First evidence for **tWZ**
 - First simultaneous measurement of **$t\bar{t}Z+tWZ$** and **tZq** 
 - First inclusive and differential **tW** measurement in Run 3

**Statistically limited,
can still improve with
more data!**

More results on their way: stay tuned!

BACKUP

Treating the interference between tWZ and ttZ

MadSTR plugin used for removal through diagram removal schemes

Amplitude A divided into A(res) and A(non-res)

- DR1: removes A(res) in A, used for nominal
- DR2: removes $|A(\text{res})|^2$ in $|A|^2$ (leaves interference term) for uncertainty
- DS: subtraction term, lies between DR1 and DR2

Overview of diagram removal/subtraction schemes

[Frixione et al., JHEP12\(2019\)008](#)

NLO process with a possible resonance

$$a + b \rightarrow \delta + \gamma + X \quad \beta \rightarrow \delta + \gamma$$

$$\mathcal{A}_{ab \rightarrow \delta\gamma X} = \mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta)} + \mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta)}$$

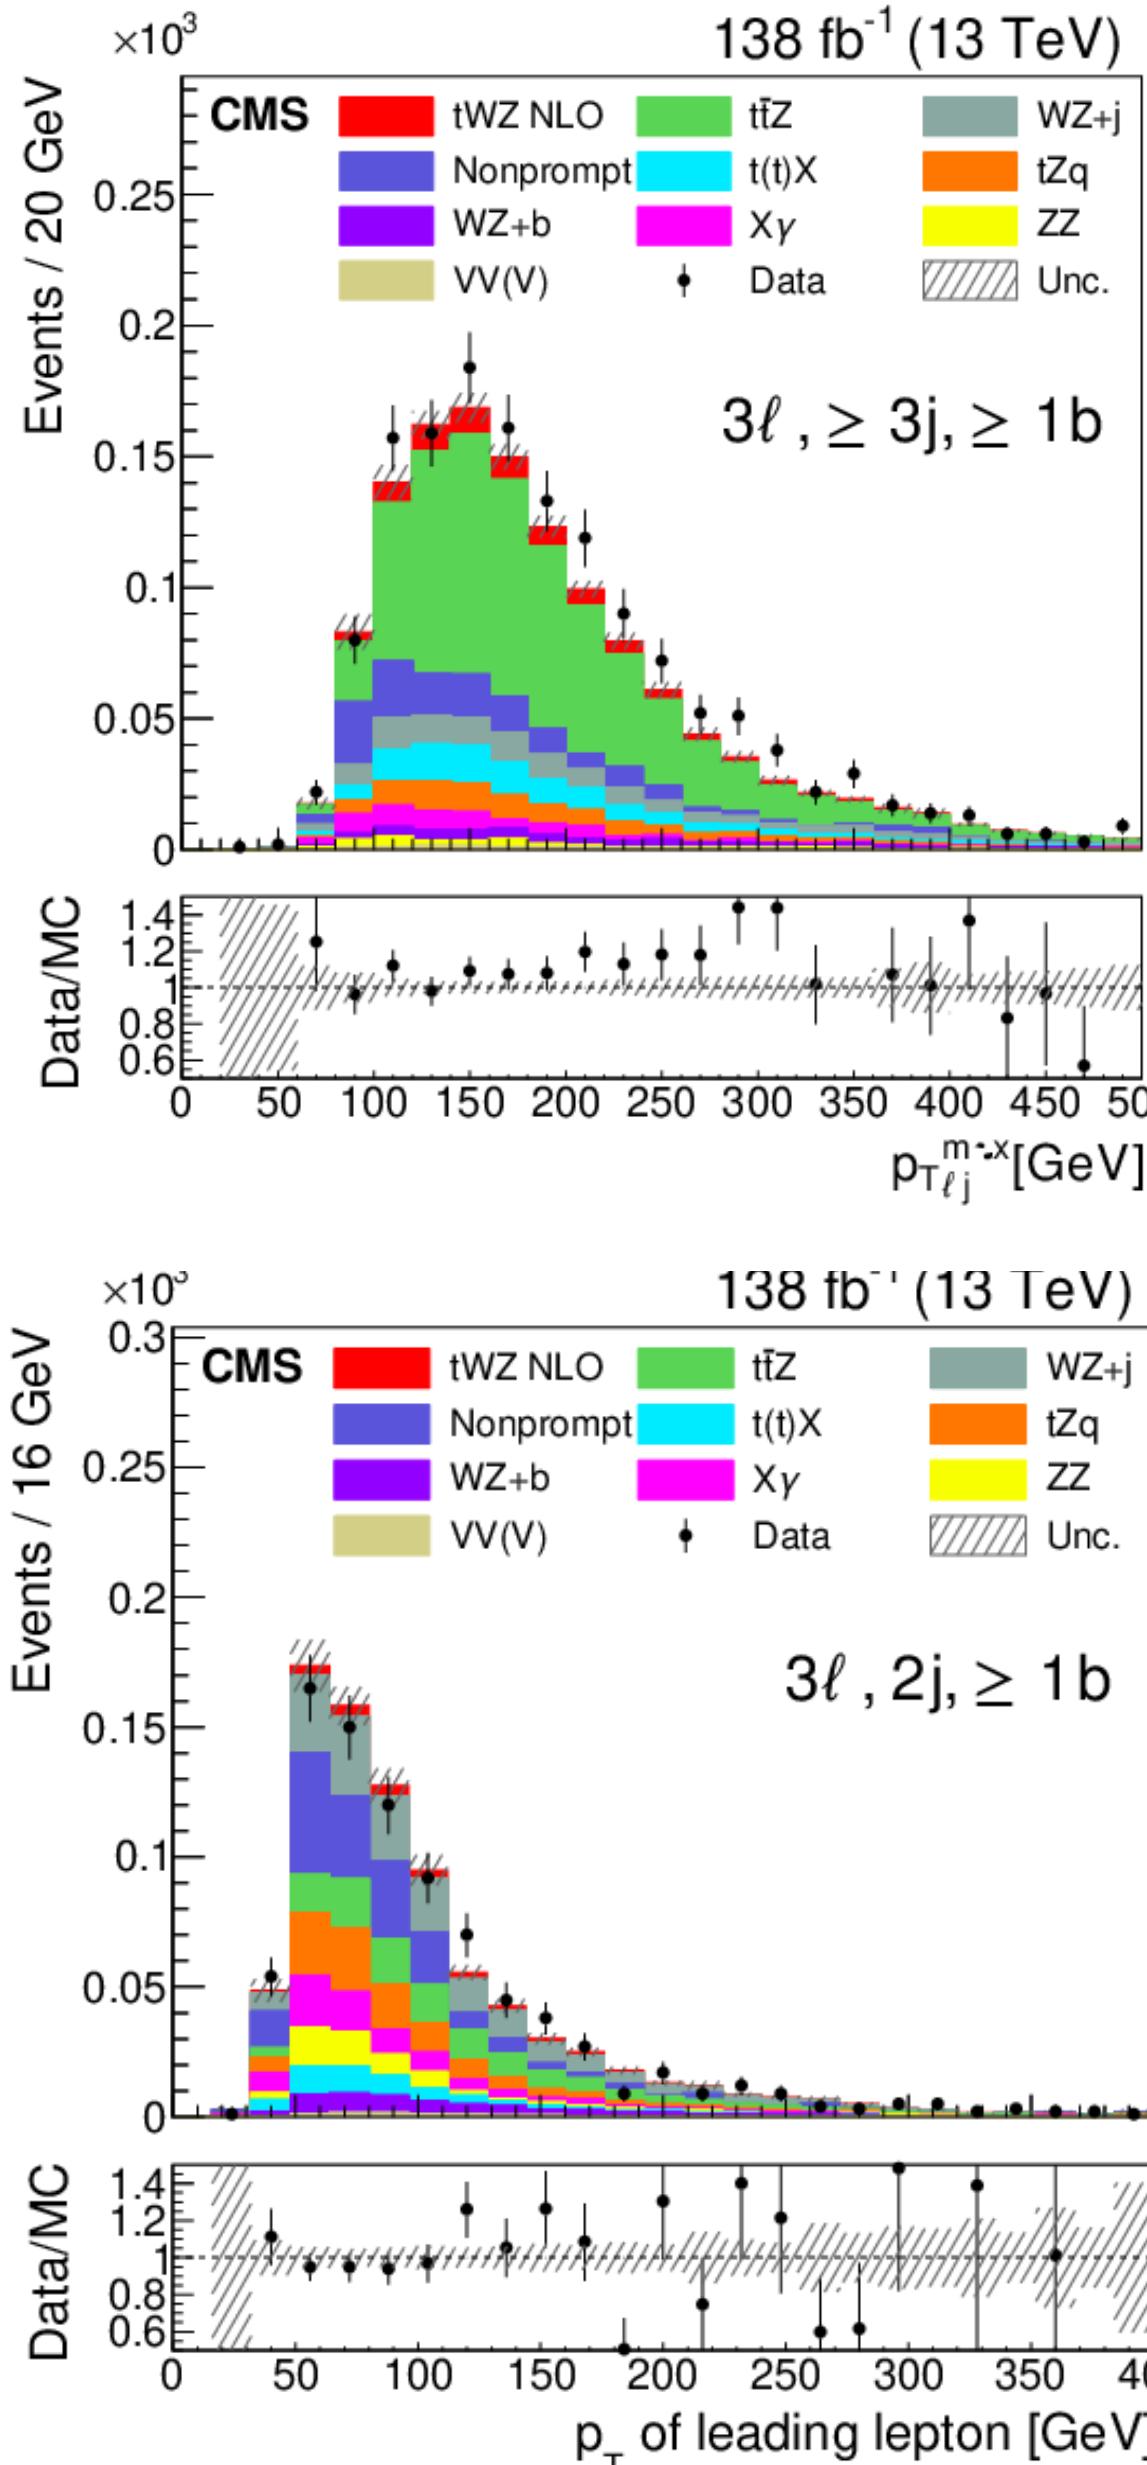

non-resonant resonant

$$|\mathcal{A}_{ab \rightarrow \delta\gamma X}|^2 = \left| \mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta)} \right|^2 + 2\Re \left(\mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta)} \mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta)\dagger} \right) + \left| \mathcal{A}_{ab \rightarrow \delta\gamma X}^{(\beta)} \right|^2$$

- DR+I (DR1): removes both resonance and interference term
- DR2: removes only the resonant term
- The diagram subtraction (DS) scheme implements removal at the cross section level

- Nonprompt lepton contribution estimated from data:
 - Weights derived from simulated QCD multimeter samples and assigned to events in CR enriched in nonprompt leptons
 - 30% uncertainty assigned from validation test

Neural networks in the tWZ analysis

ICHEP
2024

- Resolved: 3 leptons, 2j, $\geq 1b$ **Binary NN**

Binary classifier DNN discriminating tWZ vs backgrounds.

Inputs: nbjet, jet pT and eta, observables combining jet and lepton kinematics

- 3 leptons, $\geq 3j$, $\geq 1b$ **Multiclass NN**
- ~~4 leptons, $\geq 1b$~~

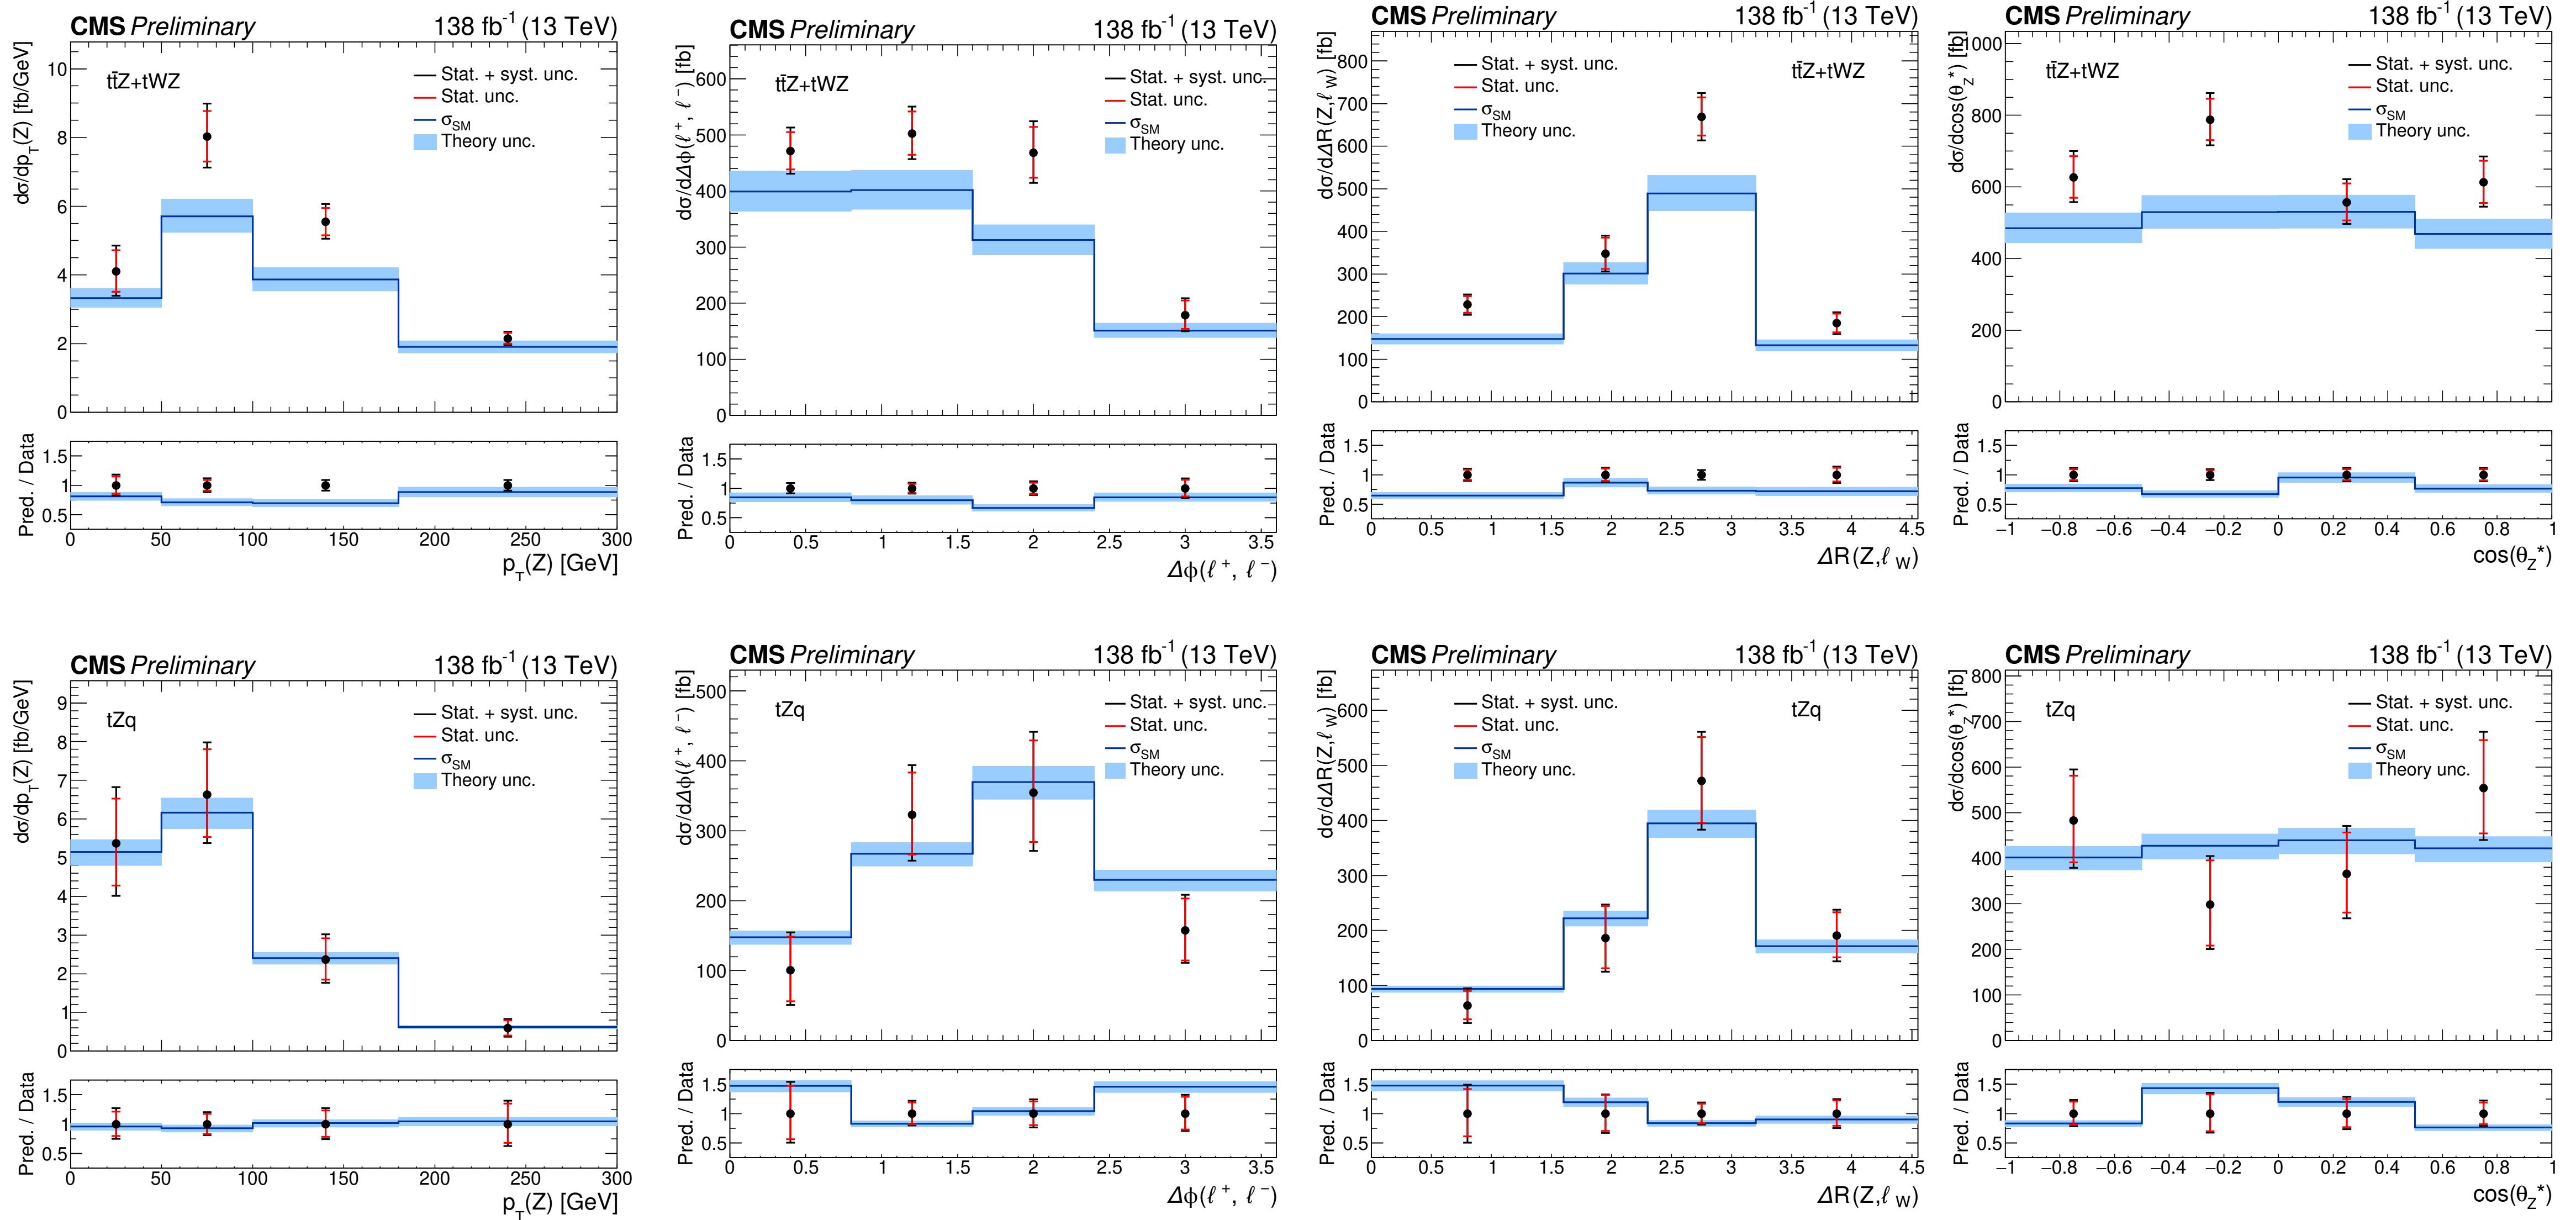

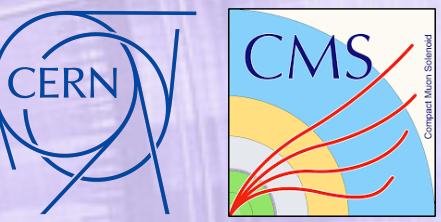

Fully connected DNN with tWZ, ttZ and background output nodes. **Inputs:** nbjet, jet pT and eta, observables combining jet and lepton kinematics, reconstructed top quark kinematics

- Boosted: hadronic top decay (fat jet)

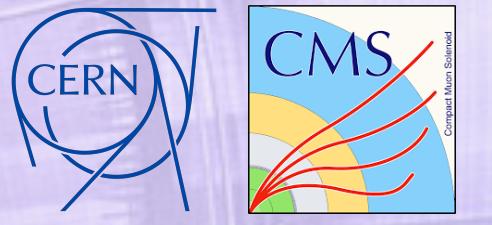

Leptonic top decay (lep. top tagger)

Fully connected DNN to tag lepton from the high pT top quark.
Inputs: third lepton and b jet kinematics

ttZ, tWZ and tZq - other differential distributions

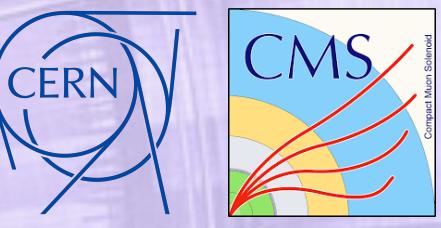

ttZ, tWZ and tZq - systematic uncertainties
