Boltzman and von Neuman entropy formulas – reminder

The entropy S of macrostate is given by the log of number W of distinct microstates that compose it

$$S = -\sum_{i=1}^{W} p(i) \ln p(i)$$ Gibbs entropy

For uniform distribution $p(i) = \frac{1}{W}$ the entropy is maximal

Boltzmann entropy

$$S = \ln W$$

Since partons are introduced as the microscopic constituents that compose the macroscopic state of the proton, it is natural to evaluate the corresponding entropy or entropy corresponding to parton density.

K. Kutak '11, Peschanski'12
A. Kovner, M. Lublinsky '15
D. Kharzeev, E. Levin '17,...

But proton as a whole is a pure state and the von Neuman entropy is 0. Can one get any nontrivial result?

For pure state (one state) density matrix is:

$$\rho = |\psi\rangle\langle\psi|$$

$$S_{VN} = -Tr[\rho \ln \rho] = -1 \ln 1 = 0$$

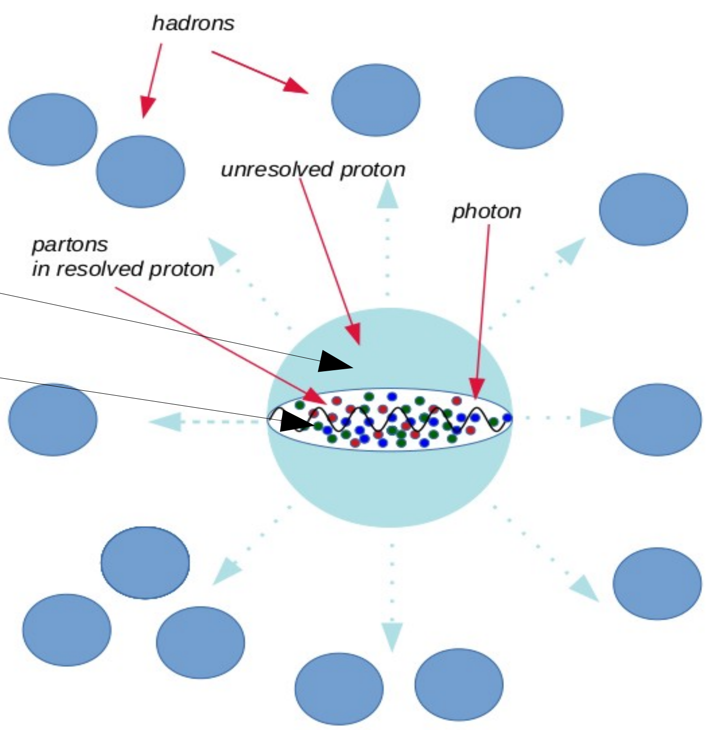
For mixed state i.e. classical statistical mixture

$$\rho = \sum p(i) |\psi_i\rangle\langle\psi_i|$$

$$S_{VN} \neq 0$$

Kharzeev, Levin '17

Entanglement entropy in DIS



B

A

The composite system is described by

$|\Psi_{AB}\rangle$ in $A \cap B$

proton's rest frame

$\mathcal{H}_B$ of dimension n_B.

$\mathcal{H}_A$ of dimension n_A

Kharzeev, Levin '17

entangled
if the product can not be expressed as separable product state

$$|\Psi_{AB}\rangle = \sum_{i,j} c_{ij} |\varphi_i^A\rangle \otimes |\varphi_j^B\rangle$$

separable
if the product can be expressed as separable product state

$$|\Psi_{AB}\rangle = |\varphi^A\rangle \otimes |\varphi^B\rangle$$

Schmidt decomposition

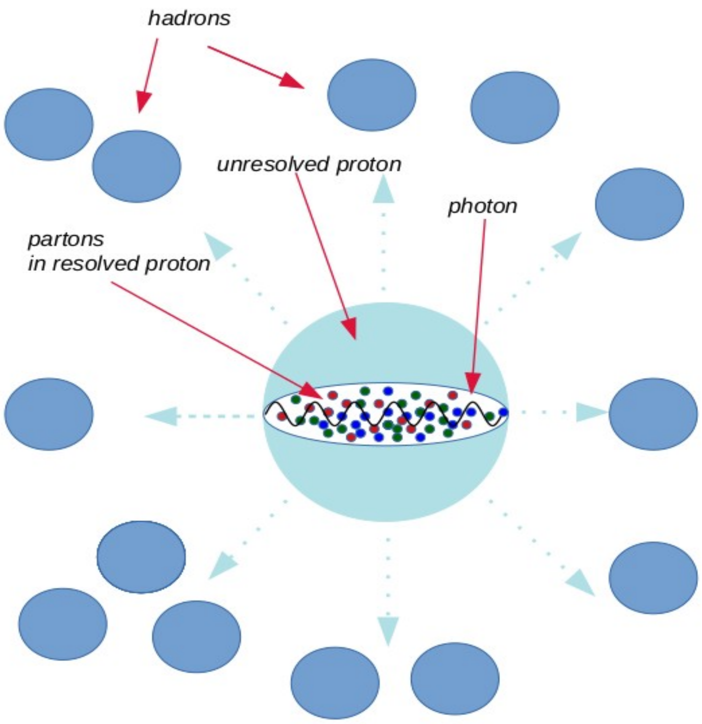
$$|\Psi_{AB}\rangle = \sum \alpha_n |\Psi_n^A\rangle |\Psi_n^B\rangle$$

orthonormal states belonging to A

orthonormal states bolonging to B

related to matrix C

Entanglement entropy in DIS



$$|\Psi_{AB}\rangle = \sum_n \alpha_n |\Psi_n^A\rangle |\Psi_n^B\rangle$$

$$\rho_{AB} = |\Psi_{AB}\rangle\langle\Psi_{AB}|$$

$$\rho_A = \mathrm{tr}_B \rho_{AB} = \sum_n \alpha_n^2 |\Psi_n^A\rangle\langle\Psi_n^A|$$

The density matrix of the mixed state probed in region A

$\alpha_n^2 \equiv p_n$ probability of state with n partons

Kharzeev, Levin '17

$$S = -\sum_n p_n \ln p_n$$

entropy results from the entanglement between the regions A and B, and can thus be interpreted as the entanglement entropy. Entropy of region A is the same as entropy in region B.

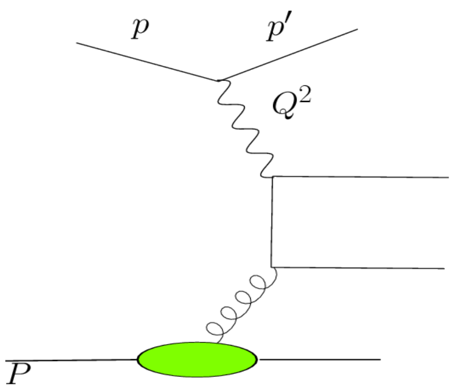
Proton structure function and dipole cross section

In the kt factorization

$$F_2(x,Q^2) = \frac{Q^2}{4\pi^2}\alpha_s \sum_q e_q^2 \int d^2k\, \mathcal{F}(x,k^2)\left(S_L(k^2,Q^2,m_q^2) + S_T(k^2,Q^2,m_q^2)\right)$$

dipole gluon density

impact factors ~ hard coefficients



In the dipole formalism

$$F_2(x,Q^2) = \frac{Q^2}{4\pi^2\alpha_{em}} \int d^2b \int_0^1 dz \int d^2r \left(|\psi_L(z,r)|^2 + |\psi_T(z,r)|^2\right) N(x,r,b)$$

$$\mathcal{F}(x,k) = \mathcal{F} + K_{ms} \otimes \mathcal{F}(x,k) - \frac{1}{R^2} TPV \otimes \mathcal{F}(x,k)^2 \qquad N(x,r,b) = N_0 + K_{ps} \otimes (N(x,r,b) - N(x,r,b)^2)$$

dipole unintegrated gluon density

Evolved with BK dipole amplitude – expectation value of product of Wilson lines in fundamental representation

related by Fourier transform

Partonic, dipole cascade

$$p_n = P_n$$

$$\frac{dP_n(Y)}{dY} = -\lambda n P_n(Y) + (n-1)\lambda P_{n-1}(Y)$$

set of partons is described by set of dipoles with fixed sizes ,Y is rapidity and is related to energy

Mueller 95, Lublinsky, Levin '03

depletion of the probability to find n dipoles due to the splitting into (n + 1) dipoles.

the growth due to the splitting of (n − 1) dipoles into n dipoles.

$$P_n(Y) = e^{-\lambda Y}\left(1 - e^{-\lambda Y}\right)^{n-1}$$

$$S = -\sum_n p_n \ln p_n$$

model of BFKL dipole cascade

$S(Y) \approx \lambda Y$ where $Y = \ln 1/x$

$$\langle n \rangle = \sum_n n P_n(Y) = \left(\frac{1}{x}\right)^{\lambda}$$

BFKL intercept = $4\ \ln 2\ \bar{\alpha}_S$

Kharzeev, Levin '17

Assumption $\langle n \rangle \equiv xg(x)$

$$S(x) = \ln(xg(x))$$

The approach can be generalized to 3+1 d and one can account for hard scale dependence.

Density matrix in 1+1 D Nowak, Liu, Zahed '22

EE in DLL Nowak, Liu, Zahed '23

$$S(x,Q) = \ln(xg(x,Q))$$

Entropy formula - interpretation

At low x partonic microstates have equal probabilities $$P_n(Y) = e^{-\lambda Y}\left(1 - e^{-\lambda Y}\right)^{n-1}$$

In this equipartitioned state the entropy is maximal – the partonic state at small x is maximally entangled.

In terms of information theory as Shanon entropy:
- equipartitioning in the maximally entangled state means that all “signals” with different number of partons are equally likely
- it is impossible to predict how many partons will be detected in a give event.
- structure function at small x should become universal for all hadrons.

From strict bounds on entanglement entropy (from conformal field theory) one can obtain that at low x (in conformal regime) one has

$$xg(x) \le \text{const}\, x^{-1/3}$$

Kharzeev, Levin ‘17

Furthermore entropy of the final state hadrons can not be smaller than entropy of partons.

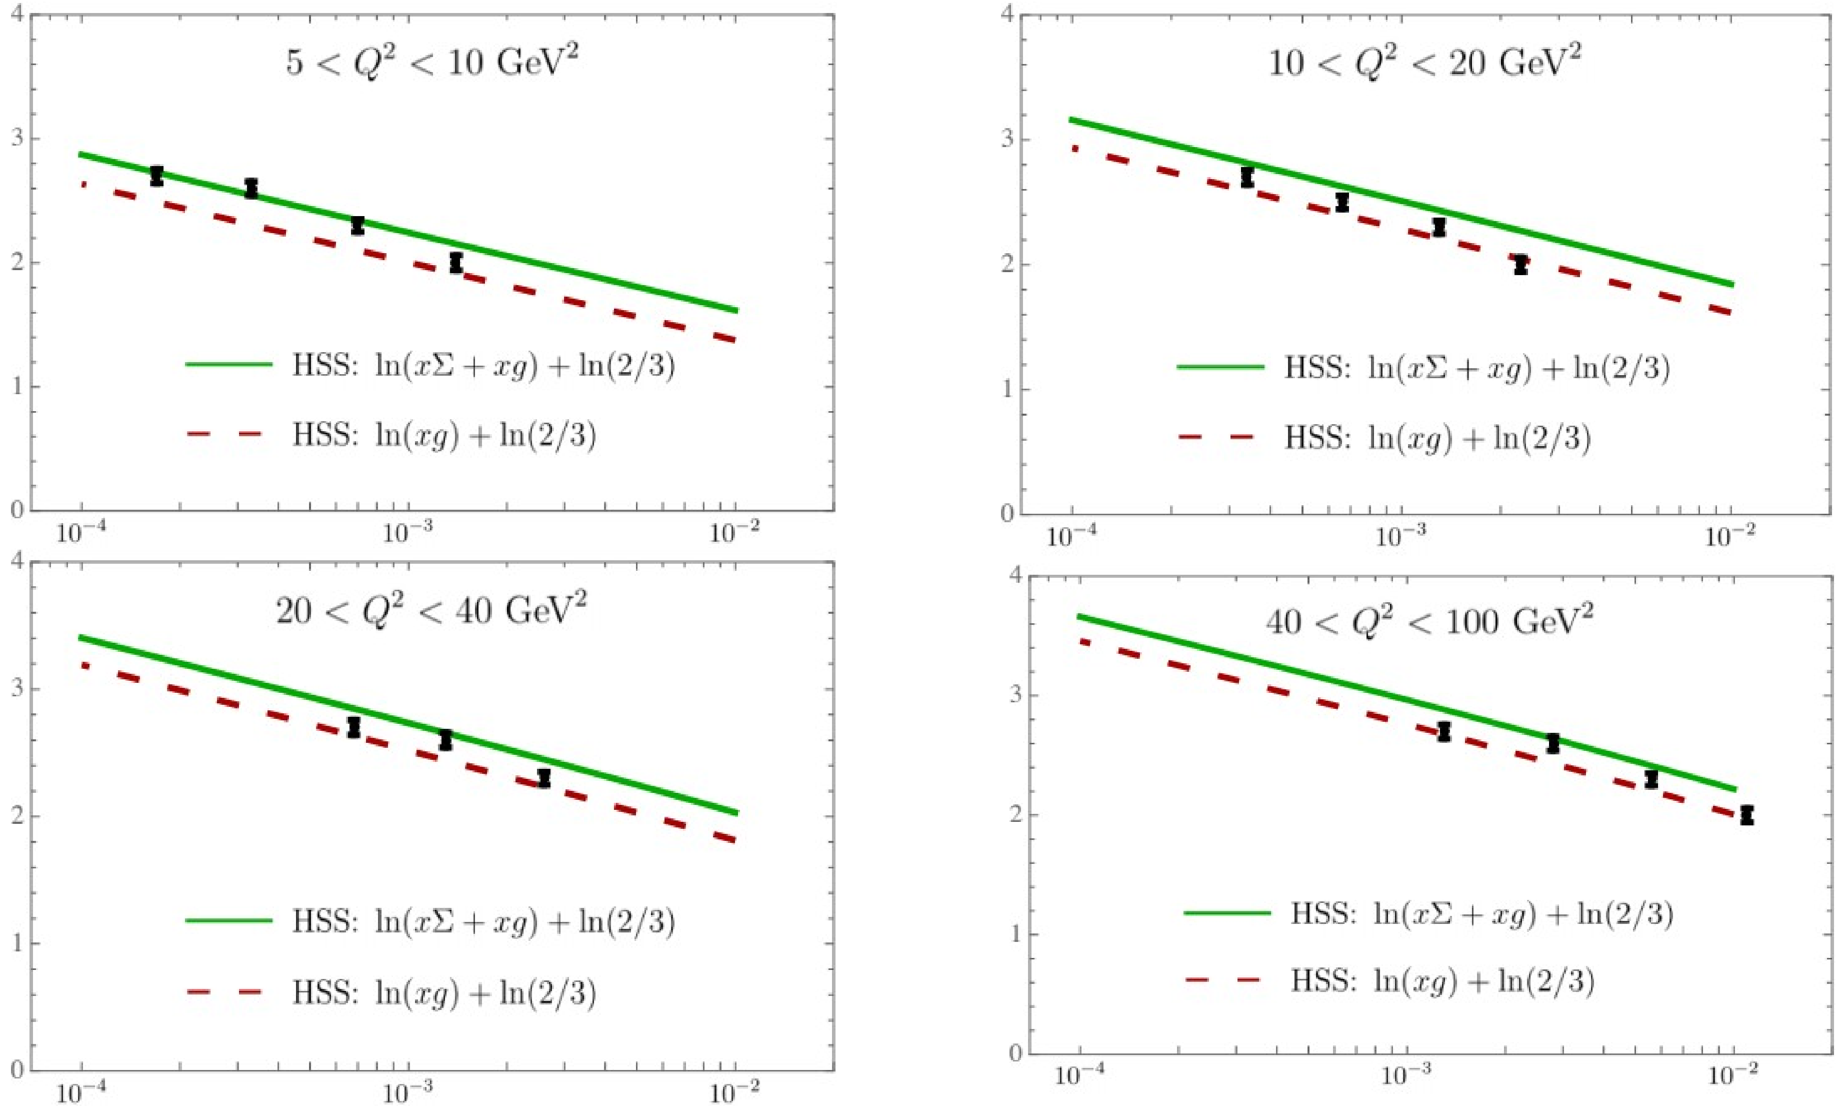
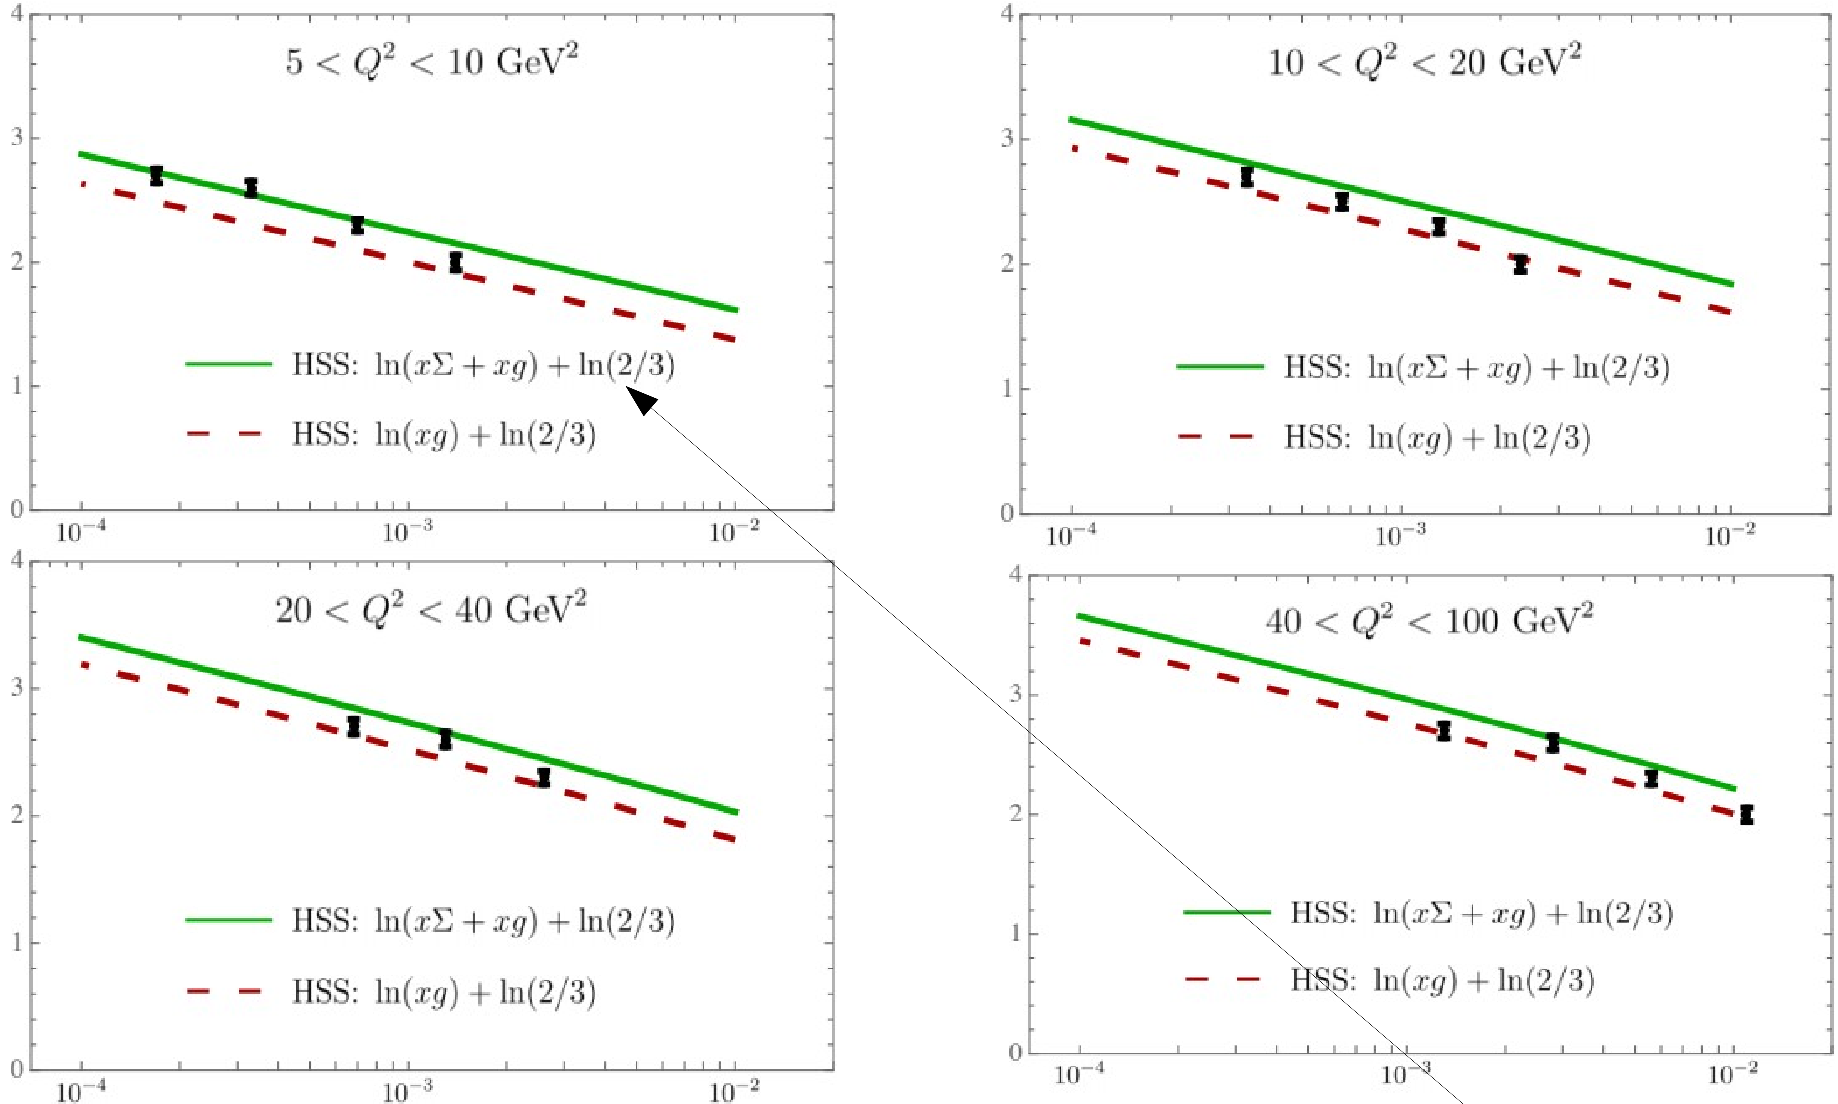
Results

Eur.Phys.J.C 82 (2022) 2, 111 Hentschinski, Kutak



Hint that the general idea works. Gluon dominates over quarks.
One has to also take into account that only charged hadrons were measured.

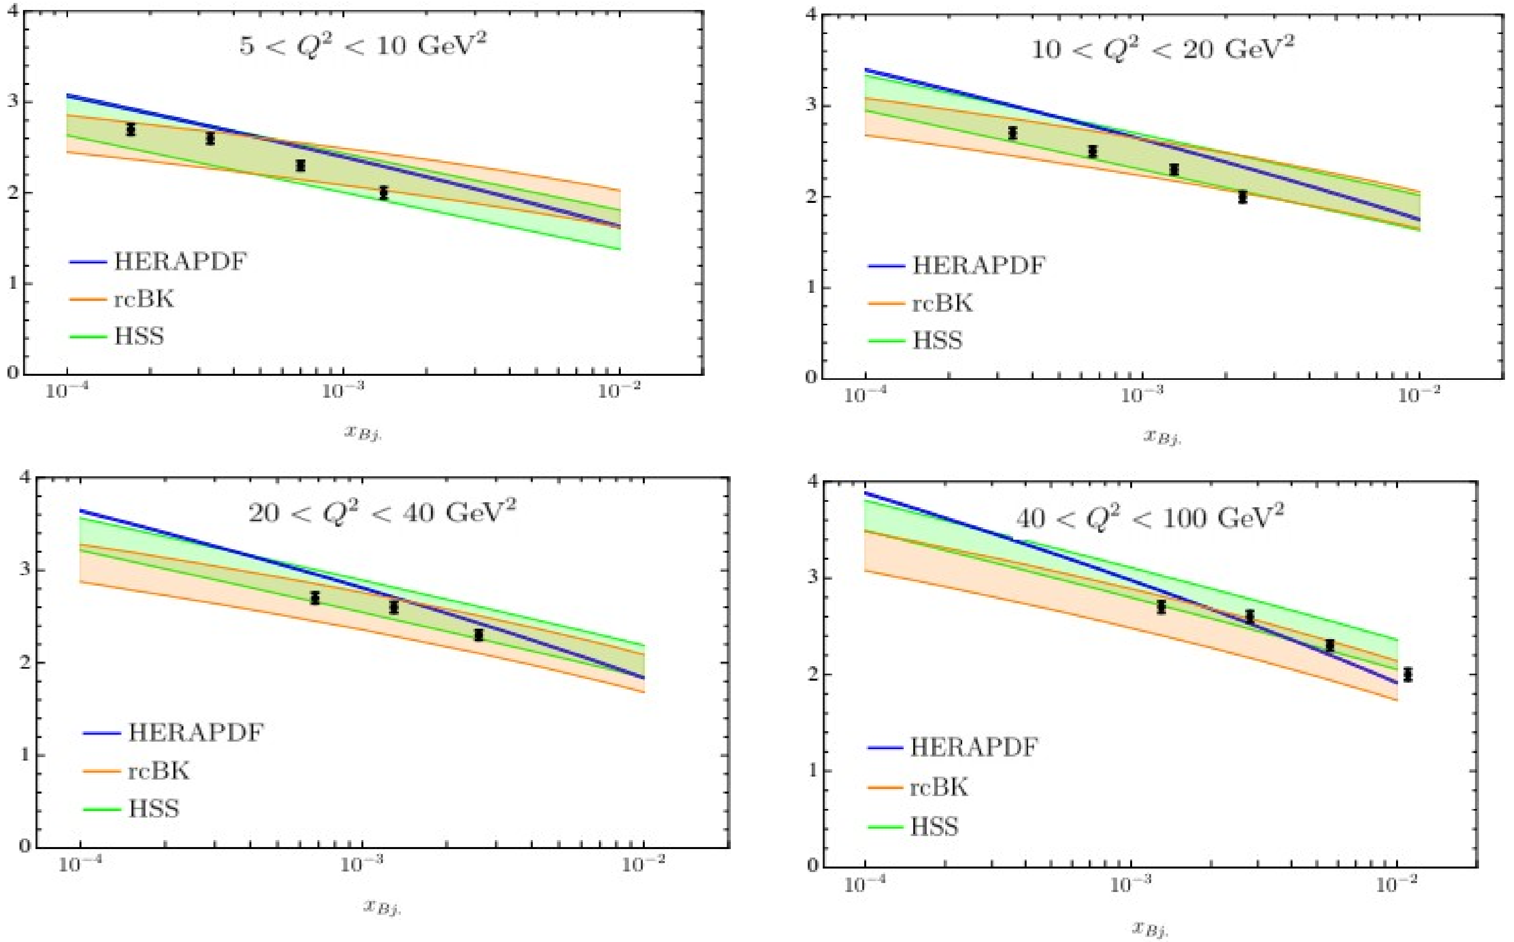
Results



Hint that the general idea works. Gluon dominates over quarks.
One has to also take into account that only charged hadrons were measured i.e 2/3 of partons contribute

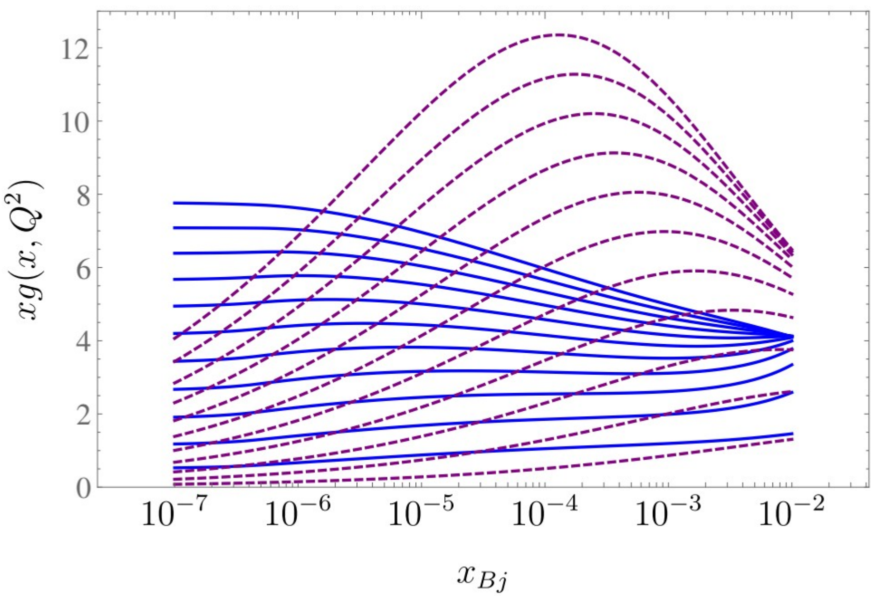
Large scales - description

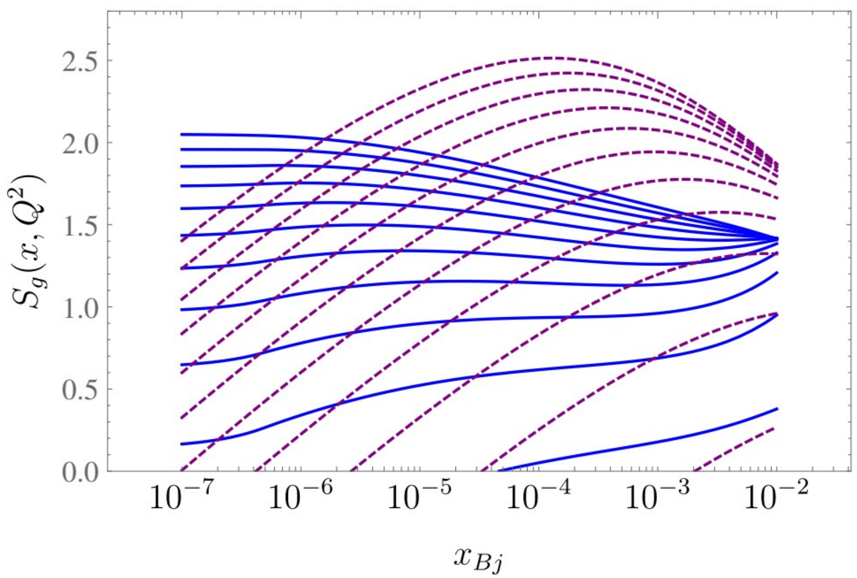
Martin Hentschinski, KK, Robert Straka '23



Integrated gluon and entropy

Curves for specific values of Q





$$\lim_{Q^2 \gg Q_s^2} S(x,Q^2) = \ln\left(S_\perp Q_s^2(x)\right) + \ln\frac{N_c}{8\alpha_s\pi^2} = \lambda \ln\frac{1}{x} + \text{const}$$

$$\lim_{Q^2 \ll Q_s^2} S(x,Q^2) = \ln\left(\frac{S_\perp Q^4}{Q_s^2(x)}\right) + \ln\frac{N_c}{16\alpha_s\pi^2}$$

Photon can not resolve proton anymore therefore the EE vanishes.
But it might be that the formalism breaks down for low scales.
There might be another source of entropy that keep the total entropy not vanishing → generalized second law Bekenstein

Small scales - prediction

EE in DDIS

momentum fraction carried by the
quark interacting with the virtual photon

Complexity and gluon density

P. Caputa, K. Kutak, 2404.07657

“The complexity of the task is defined as the minimum number of gates used to construct the circuit that accomplishes it” L. Susskind

The key point is to expand the state or the operator in the minimal basis that supports its unitary evolution

State complexity

$$|\Psi(t)\rangle = e^{-iHt}\,|\Psi_0\rangle = \sum_{n=0} \psi_n(t)\,|K_n\rangle$$

$$H\,|K_n\rangle = a_n\,|K_n\rangle + b_n\,|K_{n-1}\rangle + b_{n+1}\,|K_{n+1}\rangle$$

$$\mathcal{C}_K(t) = \langle n \rangle = \sum_n n\,p_n(t)$$

$$p_n(t) \equiv |\psi_n(t)|^2$$

$$|\psi(t)\rangle = e^{-i\alpha(L_1+L_{-1})t}\,|0\rangle \otimes |0\rangle$$

boost operator

$$S_K(t) = -\sum_n p_n(t)\log p_n(t)$$

After transforming to rapidity variable one gets

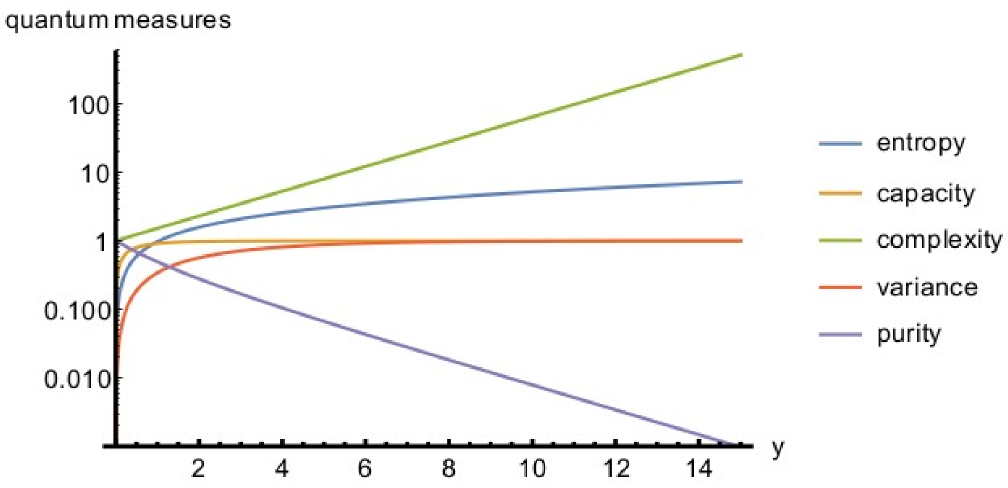
$$\partial_Y p_n(Y) = \alpha n\,p_{n-1}(Y) - \alpha(n+1)\,p_n(Y)$$

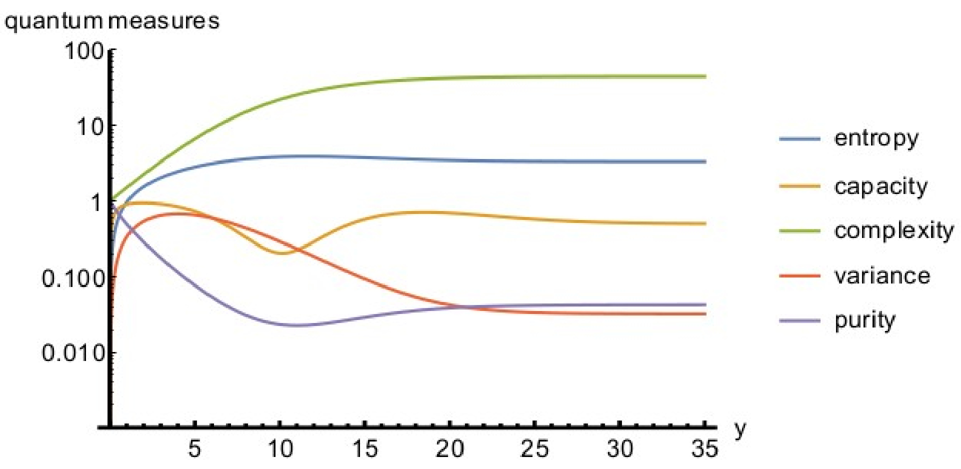
We can write the relation between the K-complexity and the gluon patron distribution

$$\mathcal{C}_K = xg(x)$$

QI measures and dipole equations

P. Caputa, K. Kutak, 2404.07657





$$\partial_Y p_n(Y) = -\lambda n p_n(Y) + \lambda(n-1)p_{n-1}(Y)$$

$$\partial_Y p_n(Y) = -\lambda n p_n(Y) + \lambda(n-1)p_{n-1}(Y) + \beta n(n+1)p_{n+1}(Y) - \beta n(n-1)p_n(Y)$$

Hagiwara,Hatta,Xiao,Yuan
Phys.Rev.D 97 (2018) 9, 094029

Conclusions and outlook

- We show evidences for the proposal for low x maximal entanglement entropy of proton constituents in .
- It can be systematically improved (quark contributions, NLO BFKL, rc BK) and can describe successfully H1 data.
- We obtain saturation of entropy at small resolution scales.
- We demonstrate that the proposal works for DDIS and that it can be used to study onset of maximal entanglement
- Saturation might be manifestation of provide mechanism for vanishing of EE at low resolution scale
- The thermodynamic based approach agrees with KL approach
- Formal study of dipole cascade model 2404.07657, P. Caputa, K. Kutak it follows that one can view gluon density as a measure of quantum complexity of proton

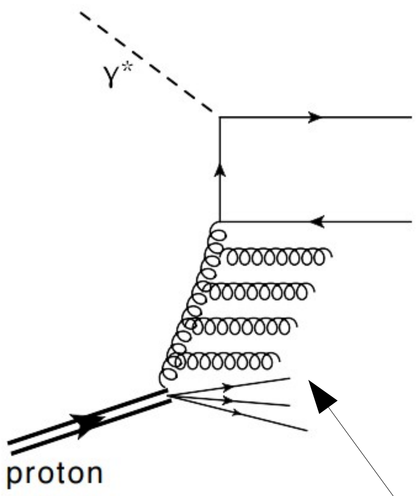
Extension of KL entropy formula

Hentschinski, Kutak ‘21

$$\left\langle n\left(\ln\frac{1}{x},Q\right)\right\rangle = xg(x,Q)+x\Sigma(x,Q)$$

To get the entropy of system of partons one needs to account for both quarks and gluons. One can view this as a higher order correction to KL formula. Furthermore it is impossible to isolate quarks from gluons therefore the compete entropy formula should receive contributions from quarks and gluons

Gluon and quark distribution



In the linear regime obeys BFKL equation. In our calculations we use NLO BFKL with kinematical improvements and running coupling. The gluon density has been fitted to F_2 data (exact kinematics was used)
