

Sets are all you need: Ultrafast jet classification on FPGAs for HL-LHC

Thursday 18 July 2024 20:40 (20 minutes)

The high-luminosity upgrade of the LHC (HL-LHC) will lead to a factor of five increase in instantaneous luminosity, making it possible for experiments as CMS and ATLAS to collect ten times more data. This proton-proton collision rate will result in higher data complexity, making more sophisticated trigger algorithms unavoidable during the HL-LHC phase. The availability of information on the individual jet constituents at the level-1 trigger makes it possible to design more precise jet identification algorithms if they meet the strict latency and resource requirements. In this work, we construct, deploy, and compare fast machine-learning algorithms based on graph and deep sets neural networks on field-programmable gate arrays (FPGAs) to perform jet classification. The latencies and resource consumption of the studied models are reported. Through quantization-aware training and efficient FPGA implementations, we show that $O(100)$ ns inference is feasible at low resource cost.
