

Unique Properties of Twelve Years Positron and Electron Spectra measured by AMS

Friday 19 July 2024 09:20 (15 minutes)

We present the continuous daily electron and positron spectra over twelve years from 1 to 42 GeV. These unique data provide critical information to the understanding of the propagation of the same mass but opposite charge particles in the heliosphere. The characteristics of the data can not be explained by current theoretical models.
