

# The Ton-Scale Search for Neutrinoless Double-Beta Decay in Germanium with LEGEND-1000

Thursday 18 July 2024 20:40 (20 minutes)

Next-generation neutrinoless double-beta decay searches seek to elucidate the Majorana nature of neutrinos and the existence of a lepton number violating process. The LEGEND-1000 experiment represents the ton-scale phase of the LEGEND program's search for neutrinoless double-beta decay of  $^{76}\text{Ge}$ , following the current intermediate-stage LEGEND-200 experiment at LNGS in Italy. The LEGEND-1000 design is based on a 1000-kg mass of p-type, inverted-coaxial, point-contact germanium detectors operated within a liquid argon active shield. The LEGEND-1000 experiment's technical design, energy resolution, material selection, and background suppression techniques combine to project a quasi-background-free search for neutrinoless double-beta decay in  $^{76}\text{Ge}$  at a half-life beyond  $10^{28}$  yr and a discovery sensitivity spanning the inverted-ordering neutrino mass scale. The innovation behind the LEGEND-1000 design, its technical readiness, and discovery potential is presented.

## Alternate track

1. Beyond the Standard Model

## I read the instructions above

Yes

**Primary author:** WATKINS, Samuel (Los Alamos National Laboratory, USA)

**Co-author:** CALGARO, Sofia

**Presenter:** CALGARO, Sofia

**Session Classification:** Poster Session 1

**Track Classification:** 02. Neutrino Physics
