Particle identification

Alpha α

Alpha particle
Two protons and two neutrons

Radon decay

^{222}Rn	Radon	α	3.8 days
^{218}Po	Radium A	α	3.1 min
^{214}Pb	Radium B	β^-	26.8 min
^{214}Bi	Radium C	β^-	19.9 min
^{214}Po	Radium C'	α	164.3 μs
^{210}Pb	Radium D	β^-	22.20 years

Beta β

Beta particle
Electron or positron

Radon decay

^{222}Rn	Radon	α	3.8 days
^{218}Po	Radium A	α	3.1 min
^{214}Pb	Radium B	β^-	26.8 min
^{214}Bi	Radium C	β^-	19.9 min
^{214}Po	Radium C'	α	164.3 μs
^{210}Pb	Radium D	β^-	22.20 years

Gamma γ

Excited nucleus of atom

Gamma photon
Electromagnetic radiation of short wavelength

^{92}U

Muon μ

How it works: Photon counting hybrid pixelated detector

Photon counting detector:

Information of individual photons

Pixelated detector: 256 x 256 pixels

Pixel size: 55 x 55 μm

Hybrid detector: sensor is bump bonded to electronics

Sensor material: Silicon or CdTe

Dark current: none

Maximum frame rate: 45 fps

Operating temperature range: 0-55 $^{\circ}\text{C}$

Applications of the MEDIPIX detectors

Spectroscopic X-ray imaging

Application in Space Dosimetry

Timepix is being exploited for radiation monitoring in NASA's Orion rocket and at the International Space Station

Image of the astronaut Chris Cassidy working near the Timepix USB on the International Space Station

Application: Art restoration

Single particle counting X-ray imaging detectors + Robotic arms! <https://insightart.eu/>

Application in Education

Type	Description	Track	Comment
Alpha, α	Helium nucleus: high energy, low speed and high mass	Appears as a spot 	On entering the silicon alphas are stopped very quickly, with energy spread uniformly
Beta, β	Electrons or positrons: high energy, high velocity	Wiggly line 	Wiggle is produced as beta moves further through the chip. Energy spread over a larger number of pixels than alpha
Gamma, γ	High frequency electromagnetic radiation	Dot 	Gamma continues to pass through the detector only interacting with a small number of pixels

- *Is there a difference between day and night radiation?*
- *Does the radiation change when somebody enters the room?*
- *What happens if I would place a piece of granit close to the detector? And what about ash? Or air filter?*
- *Is there some preference in directions of muons? And beta rays?*
- *Does the neodymium magnet affect the particles?*
- *Can I find some new particles in mountains? Or in mines? Or on board of plane? What about lightning during the storm? Can I use natural radiation to make an image of something?*

Thank you

EXTRA SLIDES

Photon counting detectors

1. Direct conversion

Conventional energy-integrating detector

Photon-counting detector

2. Elimination of electronic noise

- able to discriminate the energy of each incident x-ray photon.

Introduction about Radiation

What is radiation?

Radiation is the emission or transmission of energy in the form of waves or particles through space or through a material medium.

Radiation is often categorized as either **ionizing** or **non-ionizing**

Ionization

Ionization is the ejection of one or more electrons from an atom or molecule to produce a fragment with a net positive charge (positive ion)

Sensor in hybrid detectors

When ionising radiation strikes the detector its energy is deposited in the silicon layer. This is then converted into an electrical signal and amplified.

X-rays

The mechanisms of interaction for ionizing radiation in the form of x-rays and gamma-rays include the

1. Photoelectric effect,
2. Compton scattering and at high enough energies,
3. Electron positron pair production.
