Exploring dense QCD through hamiltonian lattice simulations in (1+1) dimensions

Yoshimasa Hidaka (YITP)

Based on Hayata, YH, Nishimura, JHEP 07 (2024) 106, arXiv:2311.11643

QCD at finite density

- What is the equation of state for QCD at finite density?
- How does the quark distribution function change from baryonic matter to quark matter?
 - What kind of phase is realized?
 An inhomogenous phase?

QCD₂

We study QCD_2 at density using density matrix renormalization group (DMRG)technique.

QCD₂

We study QCD_2 at density using density matrix renormalization group (DMRG)technique.

Properties of (1+1) dimensions

- Gauge fields are nondynamical
- Hilbert space is finite dimensional in Open Boundary Condition(OBC)

(dimensionless)QCD₂ Hamiltonian

$$J = \frac{ag_0}{2}, w = \frac{1}{2g_0a}, m = m_0/g_0 \qquad \text{We use } g_0 = 1 \text{ unit}$$

$$H/g_0 = J \sum_{n=1}^{N-1} E_i^2(n) \quad \text{Electric field term}$$

$$+ w \sum_{n=1}^{N-1} \left(\chi^\dagger(n+1) U(n) \chi(n) + \chi^\dagger(n) U^\dagger(n) \chi(n+1) \right)$$

$$+ m \sum_{n=1}^{N} (-1)^n \chi^\dagger(n) \chi(n) \quad \text{Mass term}$$

Elimination of Link variables U

Sala, Shi, Kühn, Bañuls, Demler, Cirac, Phys. Rev. D 98, 034505 (2018) Atas, Zhang, Lewis, Jahanpour, Haase, Muschik, Nature Commun. 12, 6499 (2021)

$$\Theta \chi(n) \Theta^{\dagger} := U(n-1)U(n-2)\cdots U(1)\chi(n)$$

Elimination of Link variables *U*

Sala, Shi, Kühn, Bañuls, Demler, Cirac, Phys. Rev. D 98, 034505 (2018) Atas, Zhang, Lewis, Jahanpour, Haase, Muschik, Nature Commun. 12, 6499 (2021)

$$\Theta \chi(n) \Theta^{\dagger} := U(n-1)U(n-2)\cdots U(1)\chi(n)$$

As a variational ansatz of wave function

We employ a matrix product state

$$|\psi\rangle = \sum_{\{n_i\}} |n_1\rangle \cdots |n_N\rangle \mathrm{tr} M_1^{n_1} \cdots M_N^{n_N}$$
 $[m_i]_{ij}: D \times D \text{ matrix}$

 Optimize the wave function by density matrix renormalization group technique

$$E = \min_{\psi} \langle \psi | H | \psi \rangle$$

We employ iTensor

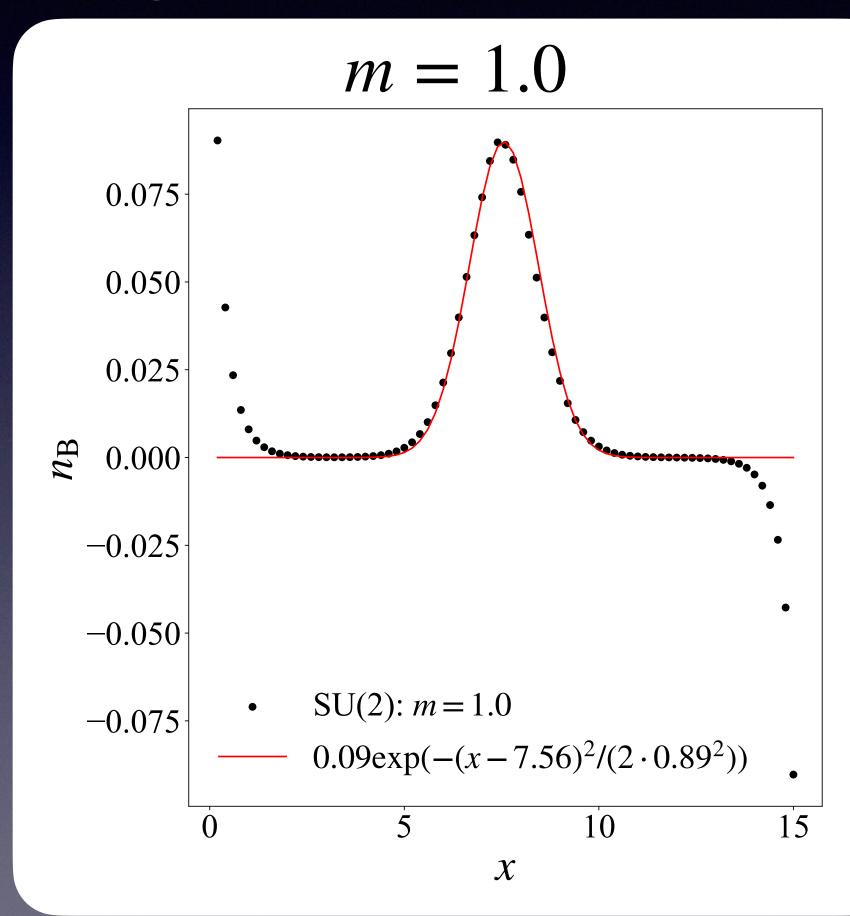

Numerical results

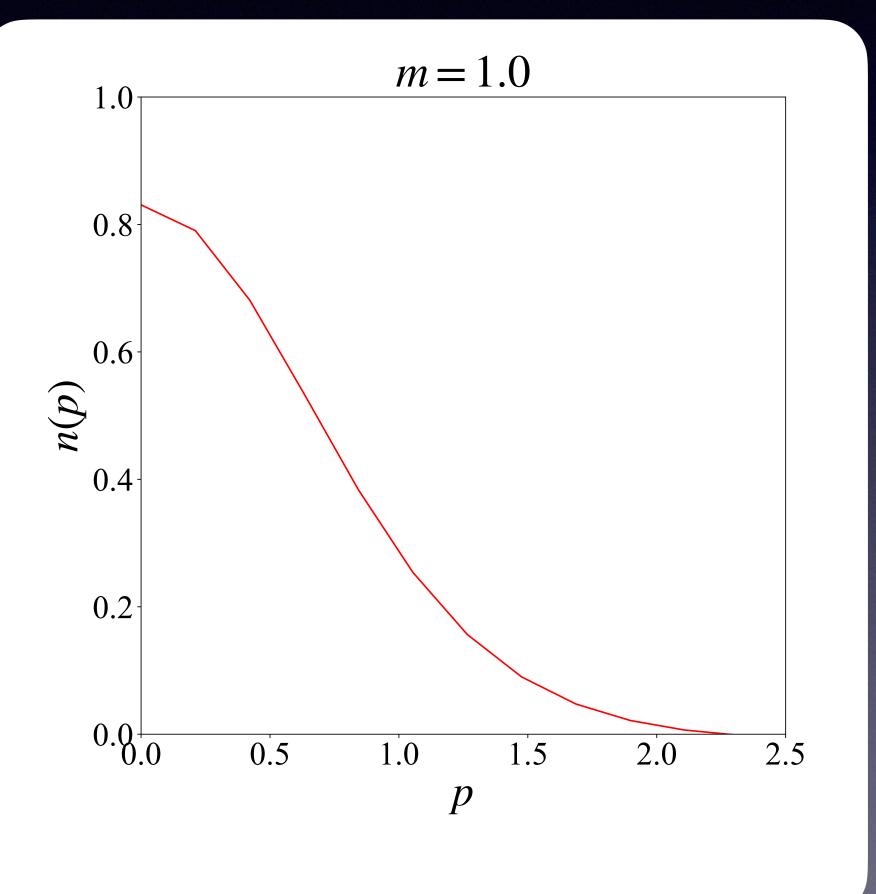

SU(2) QCD with $N_f = 1$

Color SU(2), 1 flavor, vacuum

single baryon state $\dim \mathcal{H} = 2^{300}$ J = 1/20 w = 5 volume V = 15

Baryon number density Quark distribution function

Baryon size ~ 1

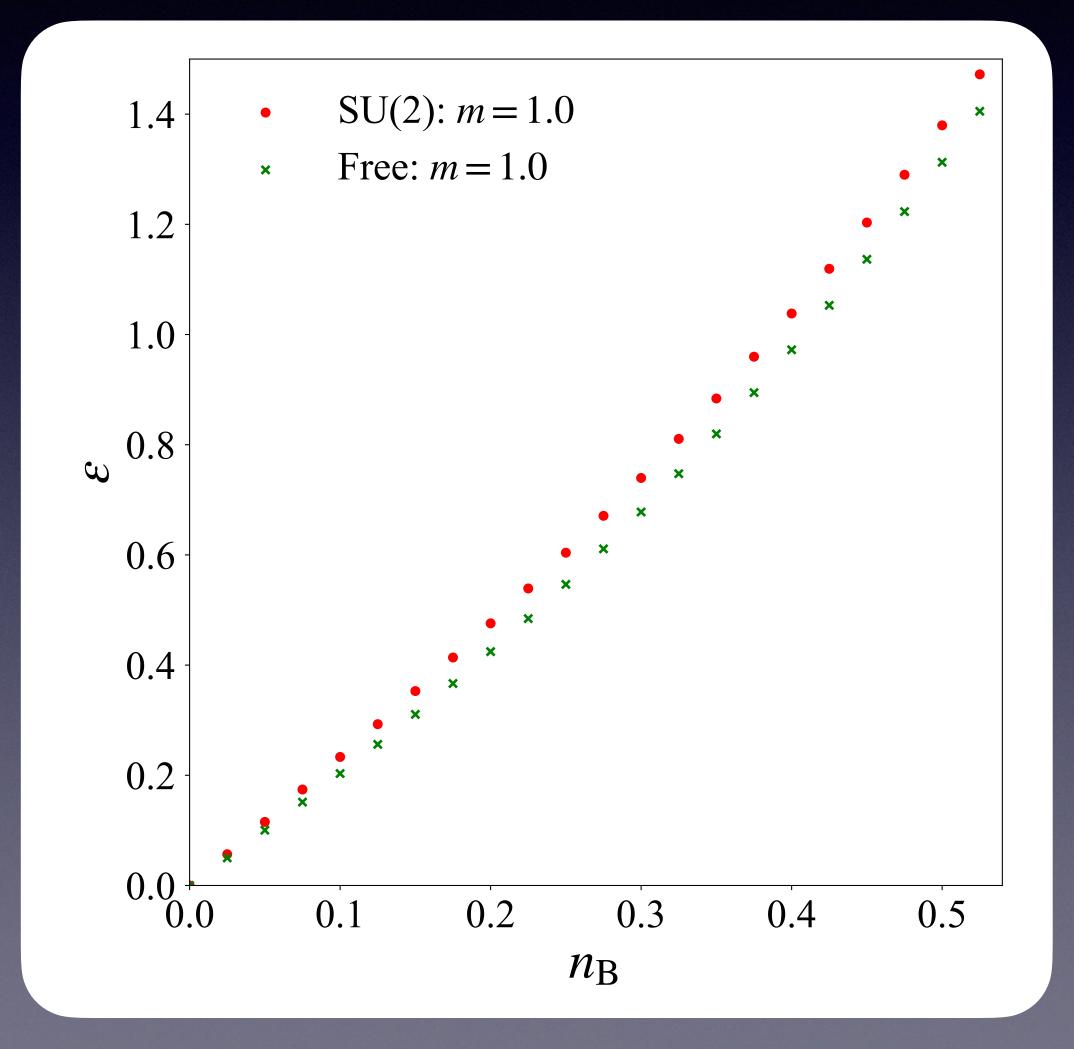

Color SU(2), 1 flavor, vacuum

J = 1/8 w = 2 V = 40 dim $\mathcal{H} = 2^{320}$

Pressure

0.6SU(2): m = 1.0Free: m = 1.0× 0.5 0.4 **Q** 0.3 0.2 0.1 0.3 0.5 0.2 0.4 0.1 n_{B}

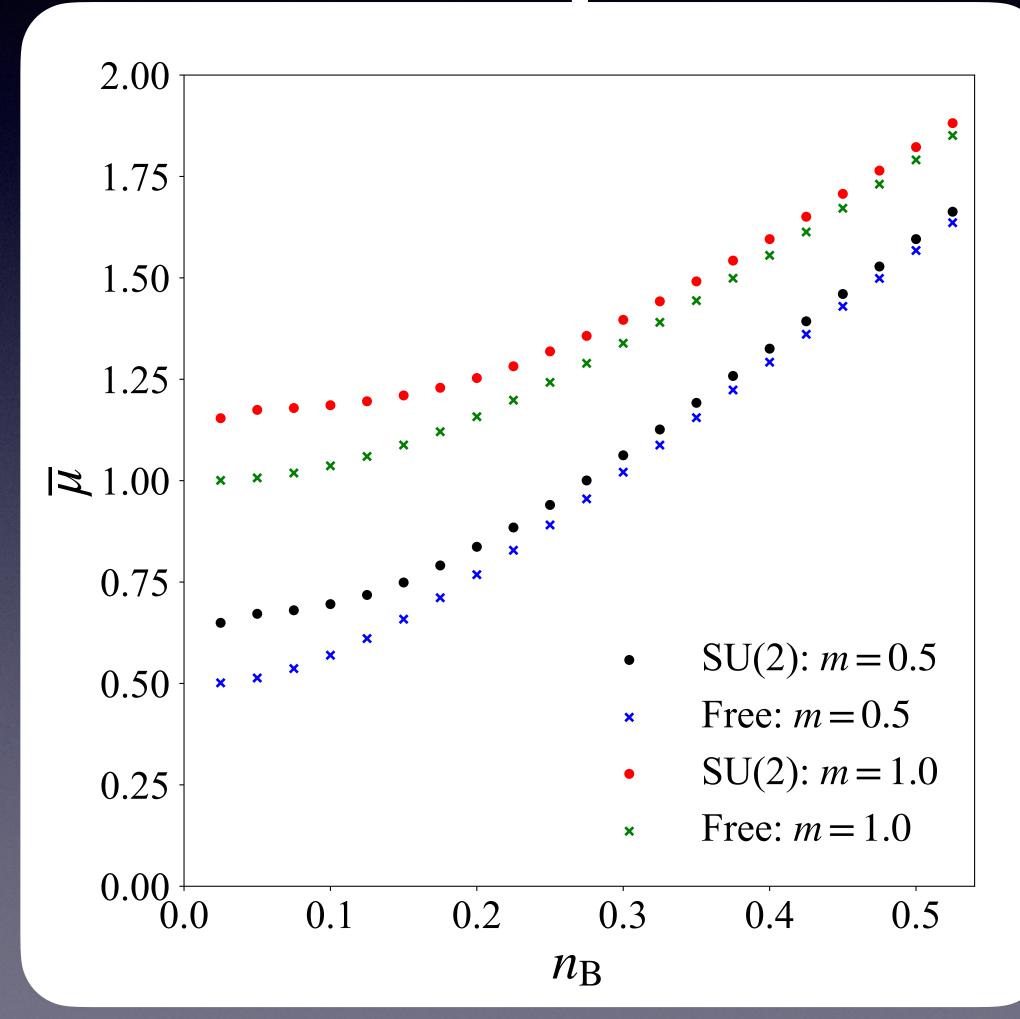

Energy density

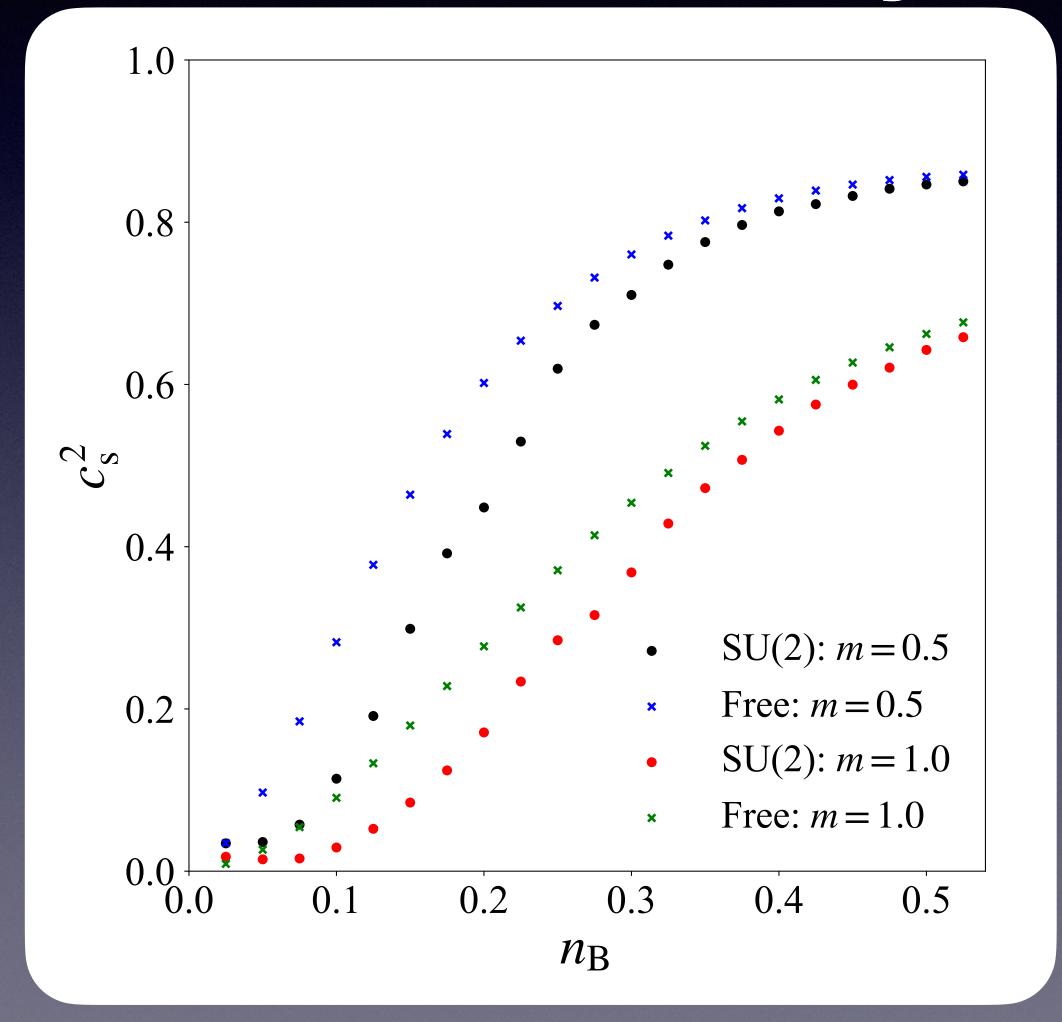

Color SU(2), 1 flavor, vacuum

J = 1/8 w = 2 V = 40 $\dim \mathcal{H} = 2^{320}$

Chemical potential

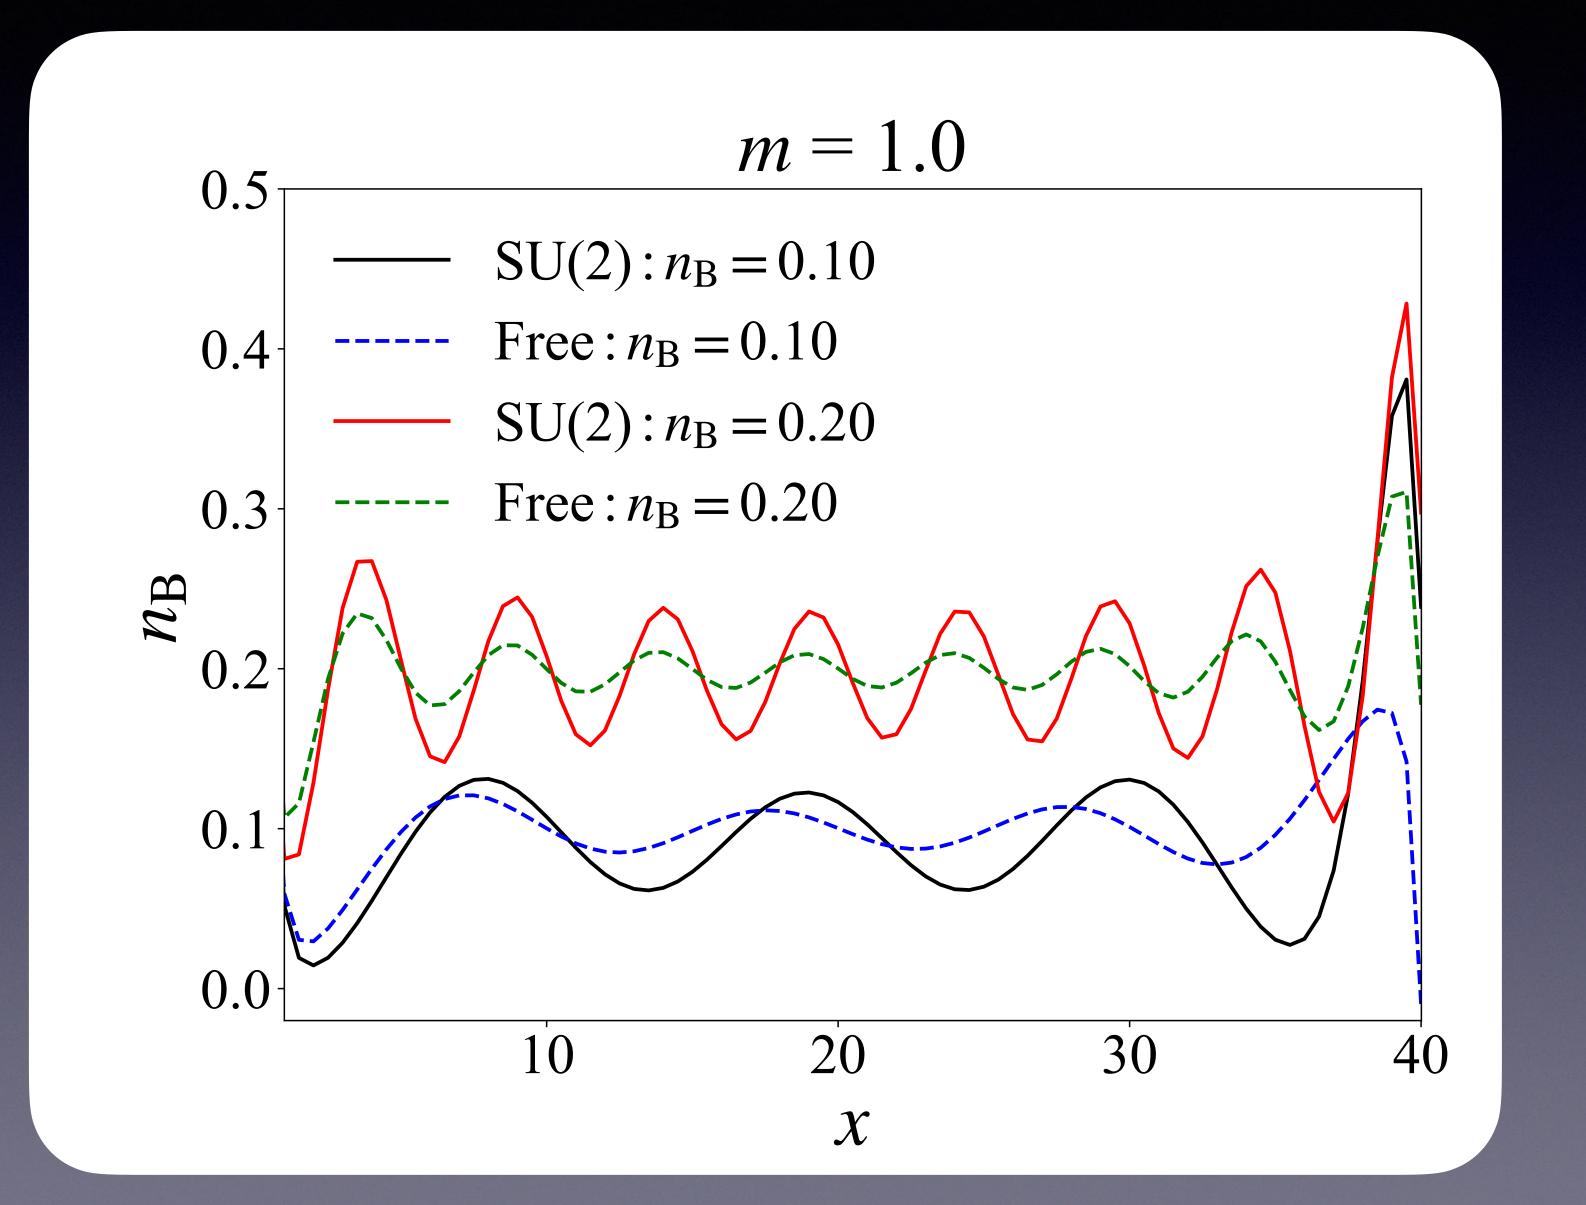

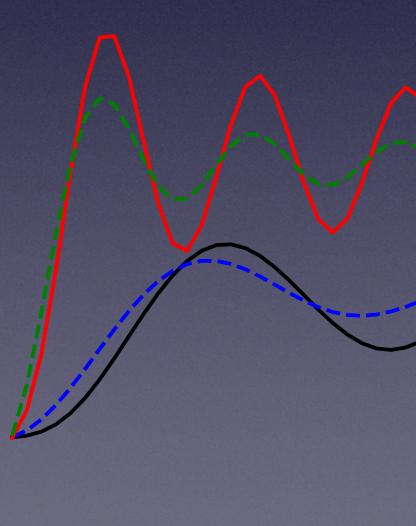

Sound velocity

Inhomogeneous phase (density wave)

$$J = 1/8$$
 $w = 2$ $V = 40$ dim $\mathcal{H} = 2^{320}$

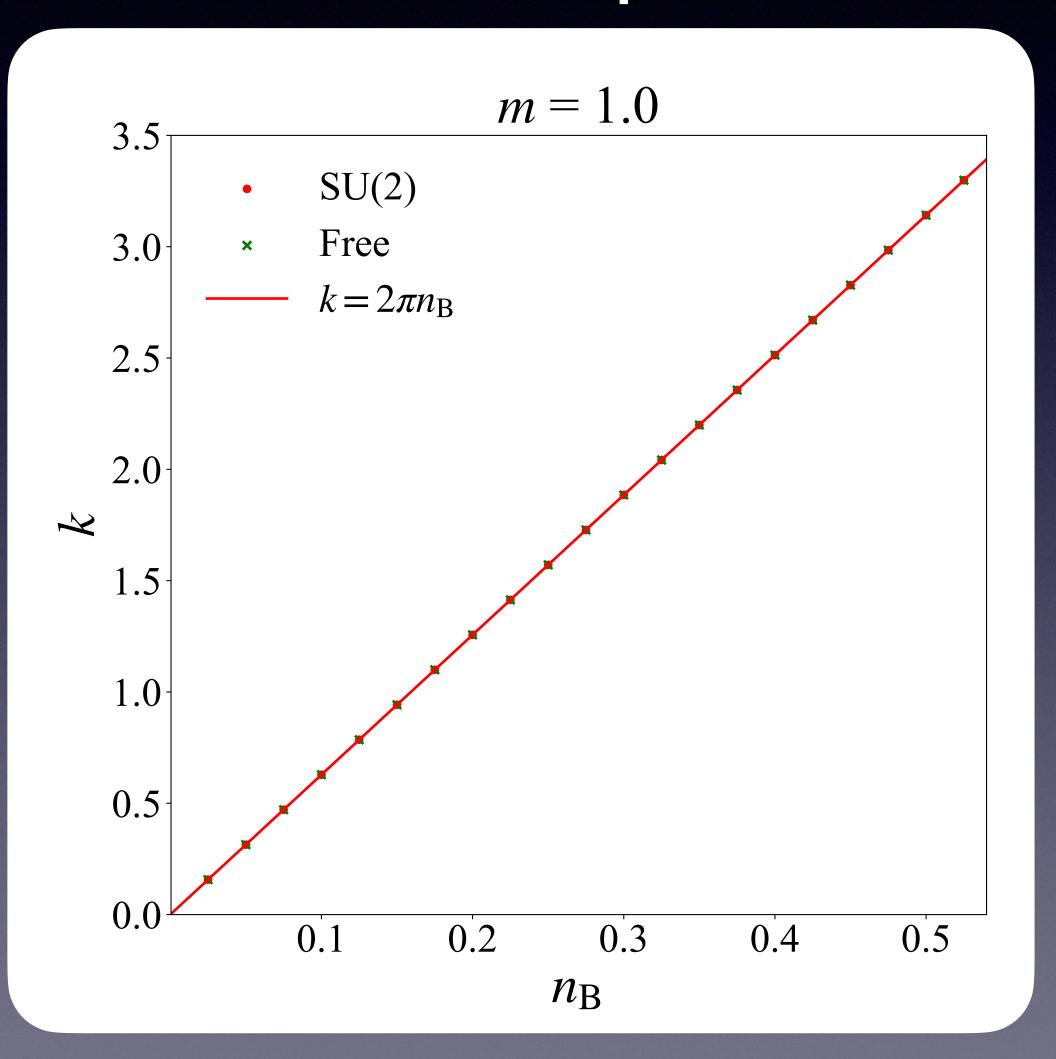

Wave number dependence

$$J = 1/8$$
 $w = 2$ $V = 40$ dim $\mathcal{H} = 2^{320}$

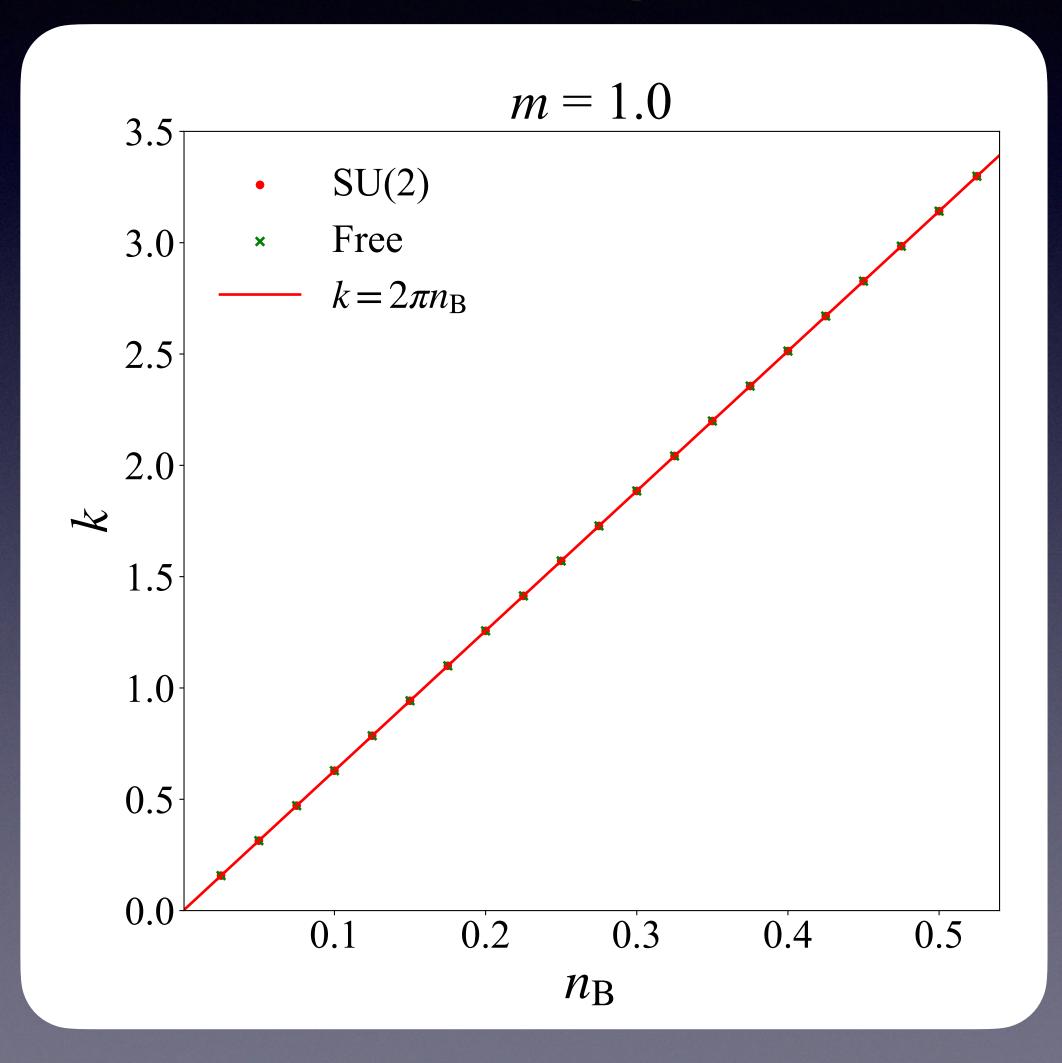

Wave number dependence

Wave number dependence

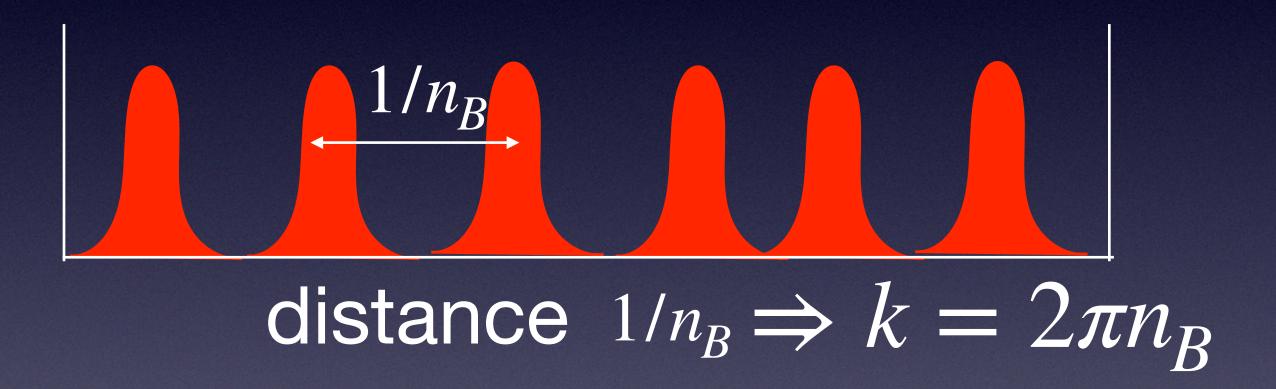

$$J = 1/8$$
 $w = 2$ $V = 40$ dim $\mathcal{H} = 2^{320}$

Wave number dependence

Hadronic picture

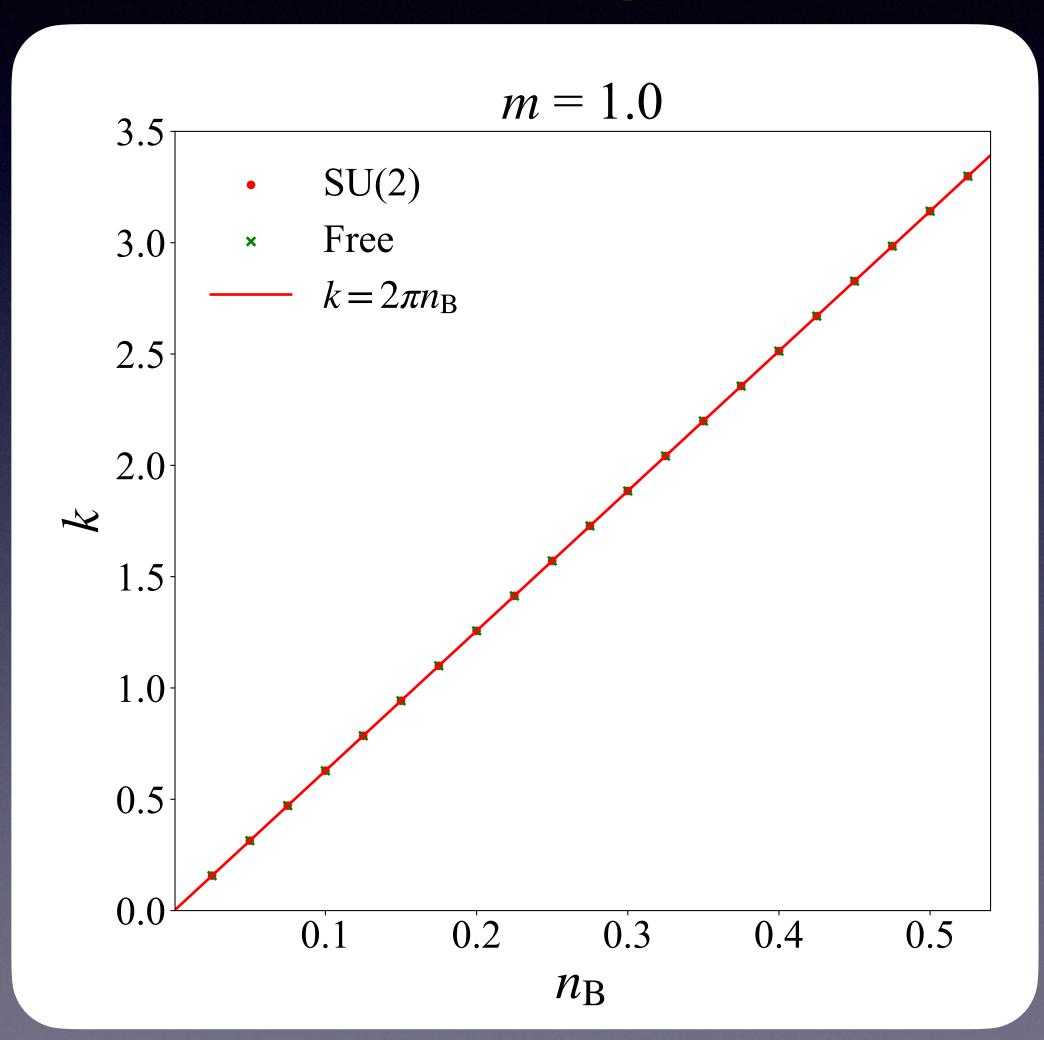

If hadron interactions are repulsive

Wave number dependence

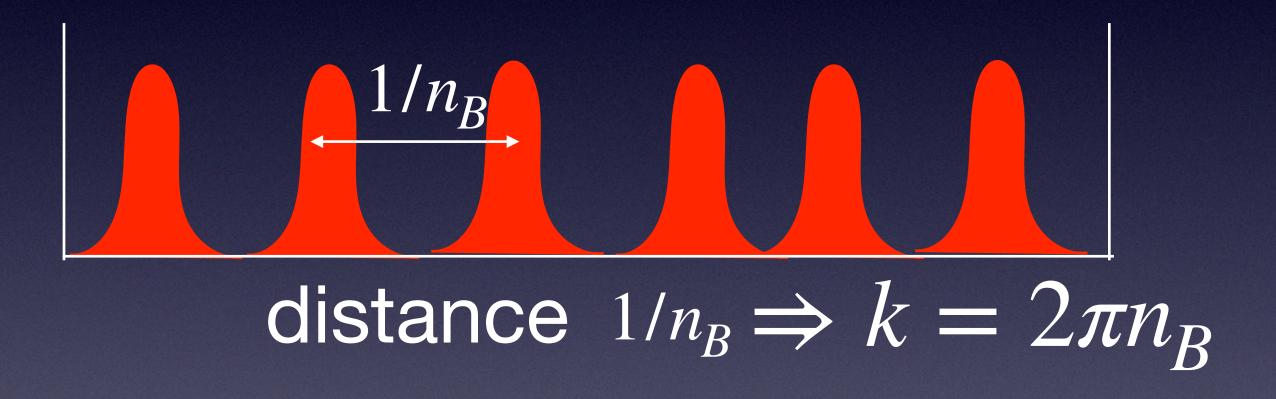

$$J = 1/8$$
 $w = 2$ $V = 40$ dim $\mathcal{H} = 2^{320}$

Wave number dependence

Hadronic picture

If hadron interactions are repulsive

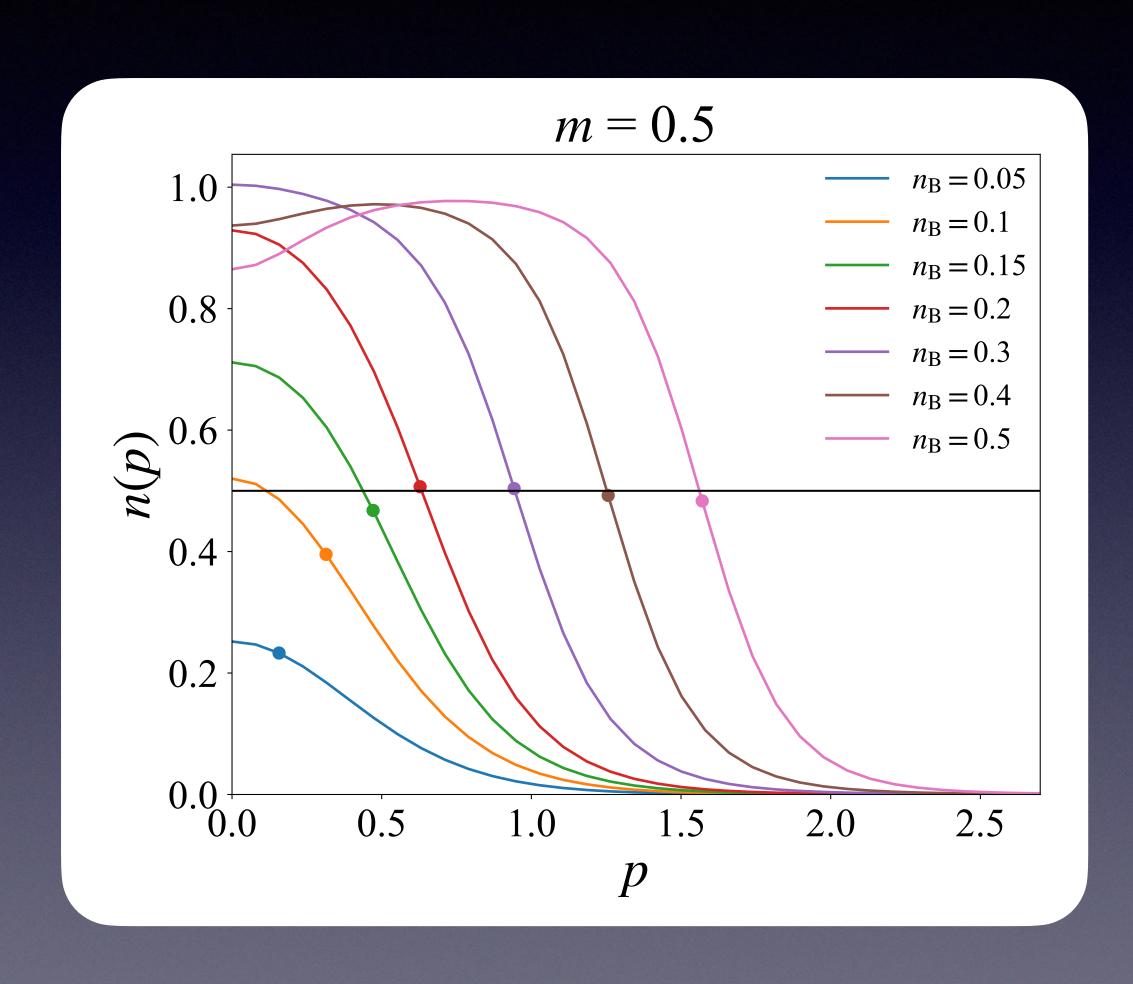

Quark picture

If interactions between quarks Fermi surface is unstable

$$\Rightarrow$$
density wave $k = 2p_{\rm F} = 2\pi n_{\rm B}$

Quark distribution function

$$J = 1/8 \ w = 2 \ V = 60 \ \dim \mathcal{H} = 2^{480}$$

- Low density
 No Fermi sea
- High density
 Fermi-sea
 +BCS like pairing
 (density wave)

baryon quark transition around $n_B \sim 0.2$

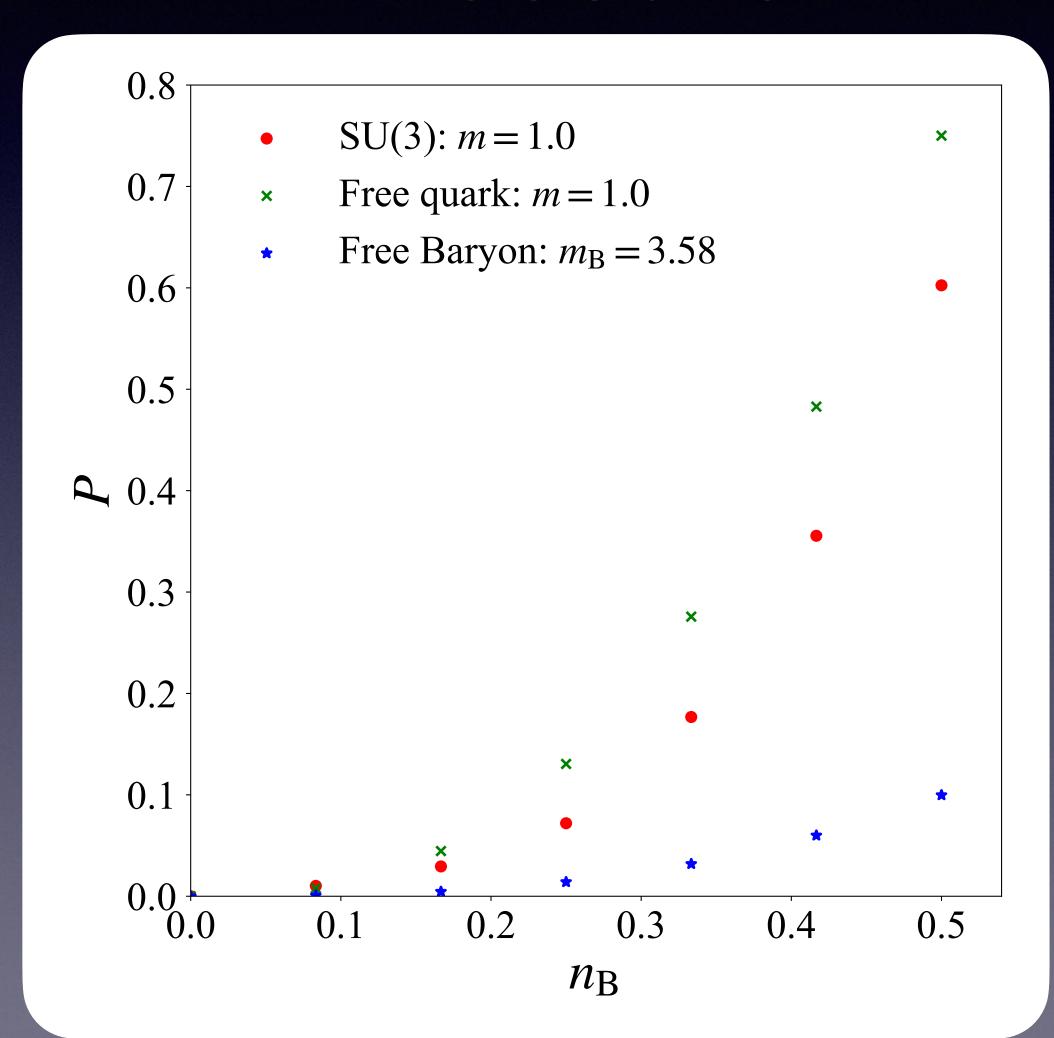

SU(3) QCD with $N_f = 1$

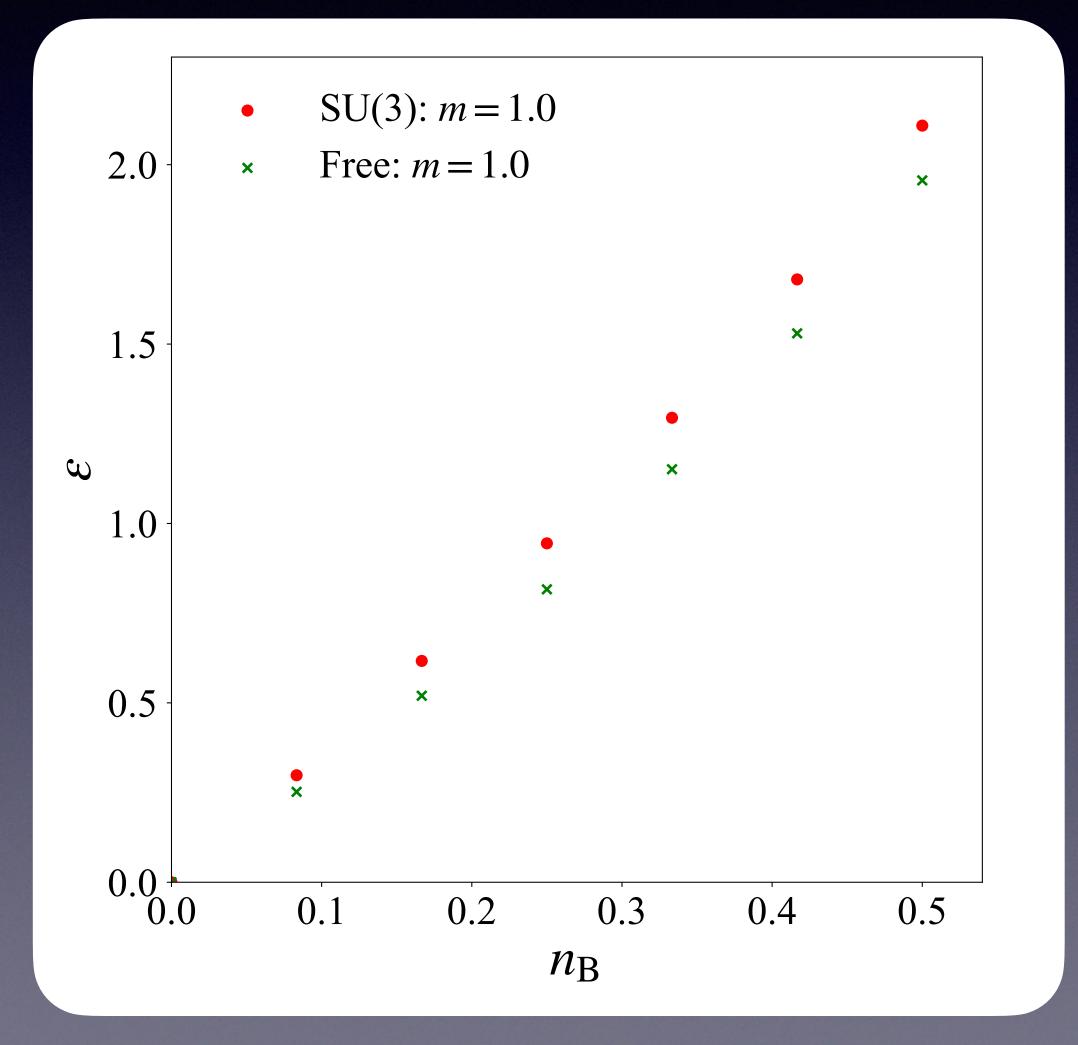

Color SU(3), 1 flavor

J = 1/8 w = 2 V = 12 dim $\mathcal{H} = 2^{144}$

Pressure

Energy density

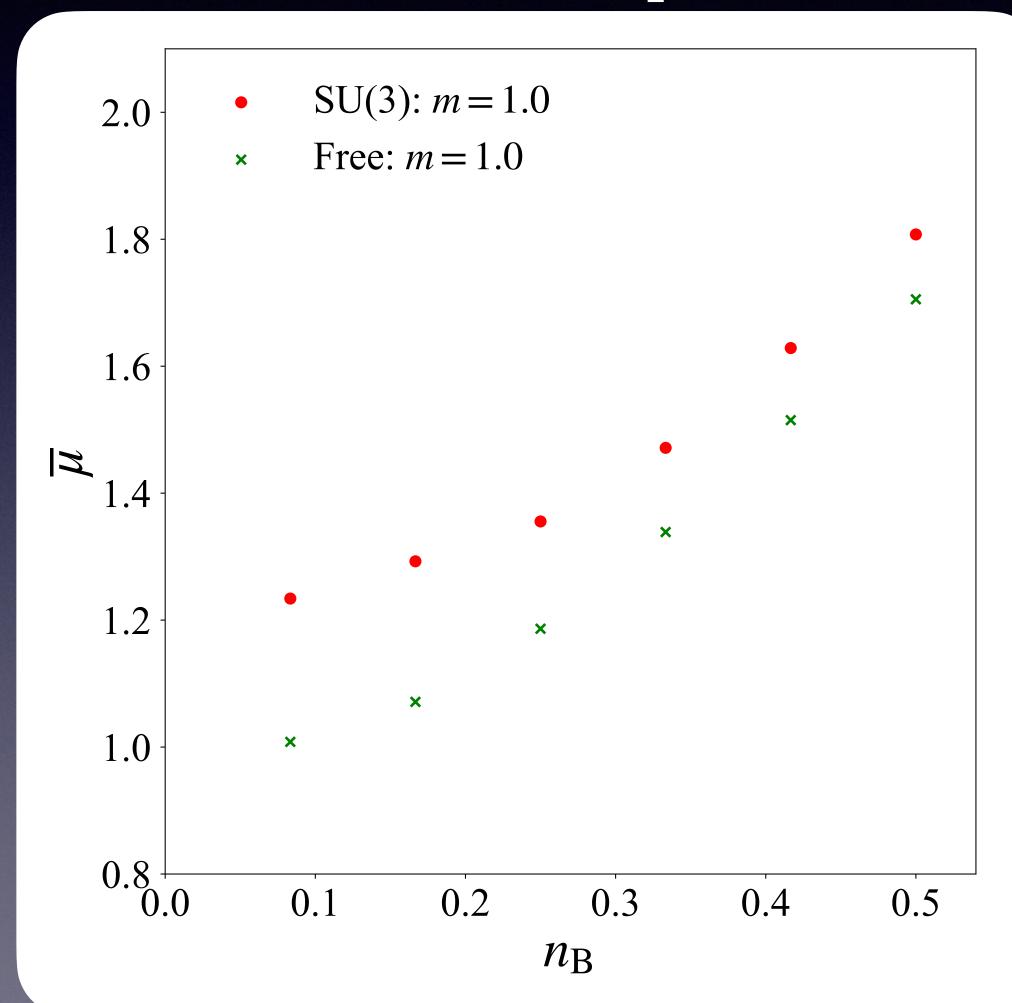

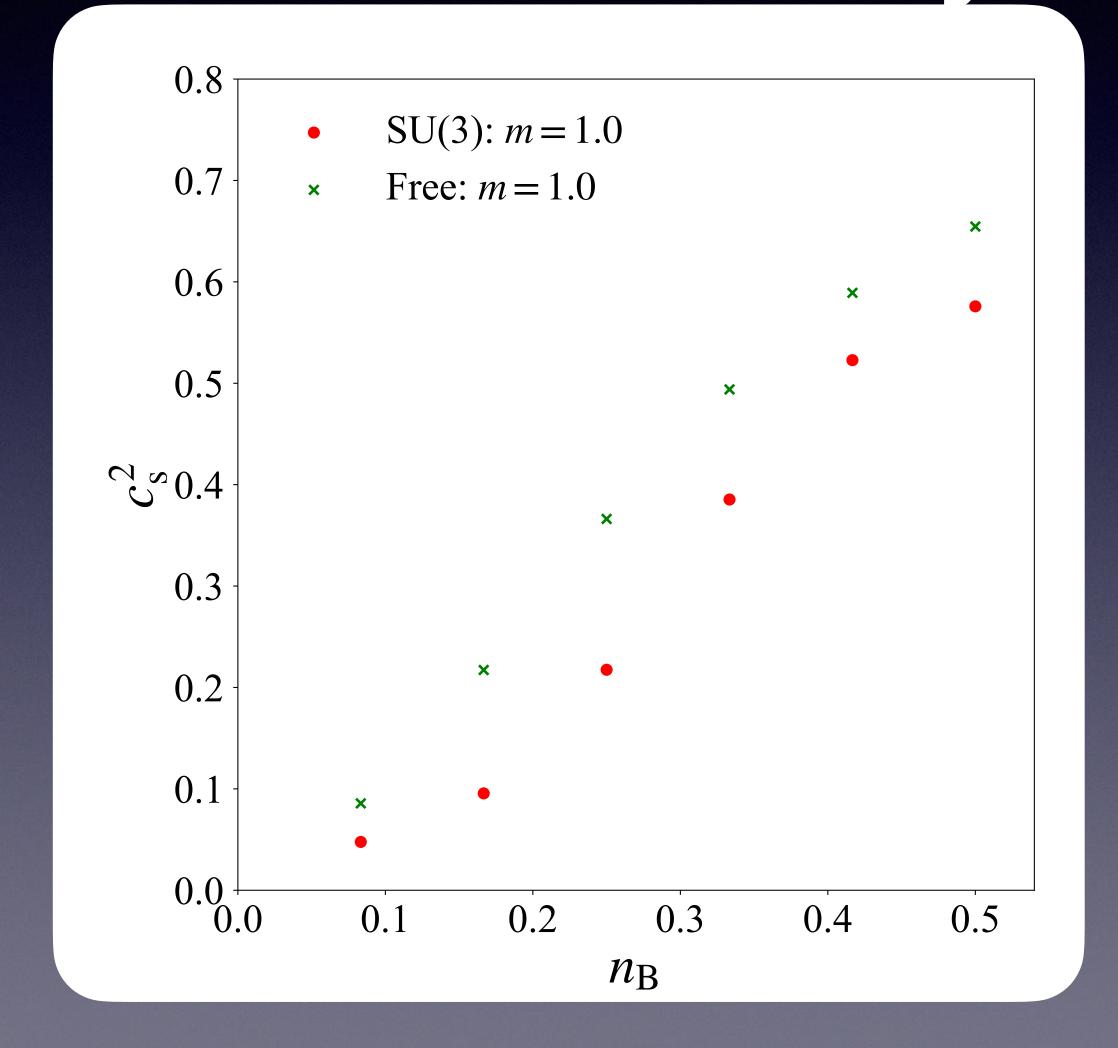

Color SU(3), 1 flavor, vacuum

J = 1/8 w = 2 V = 12 dim $\mathcal{H} = 2^{144}$

Chemical potential Sound velocity

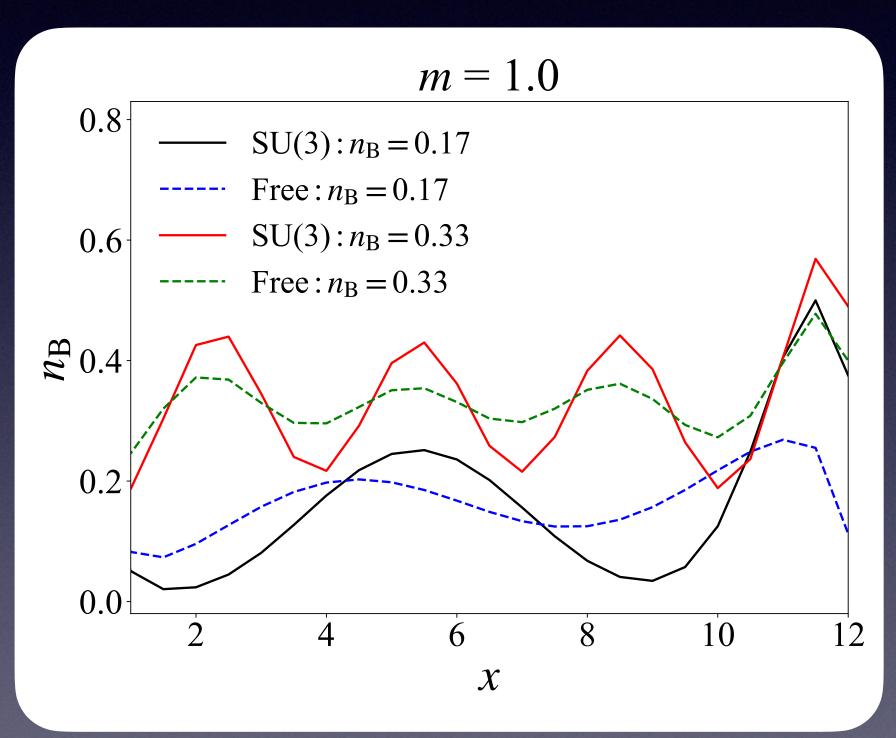

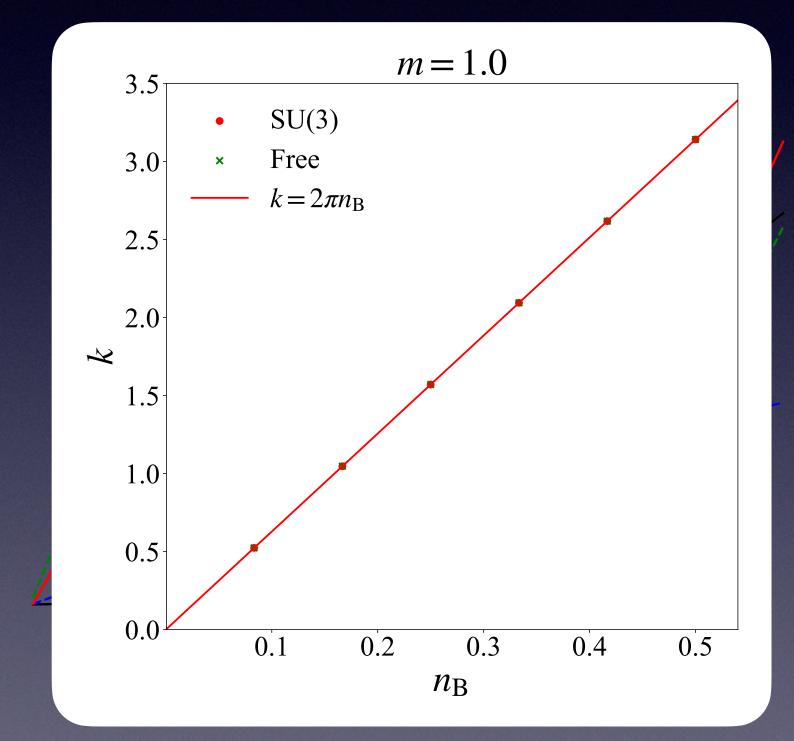

Color SU(3), 1 flavor

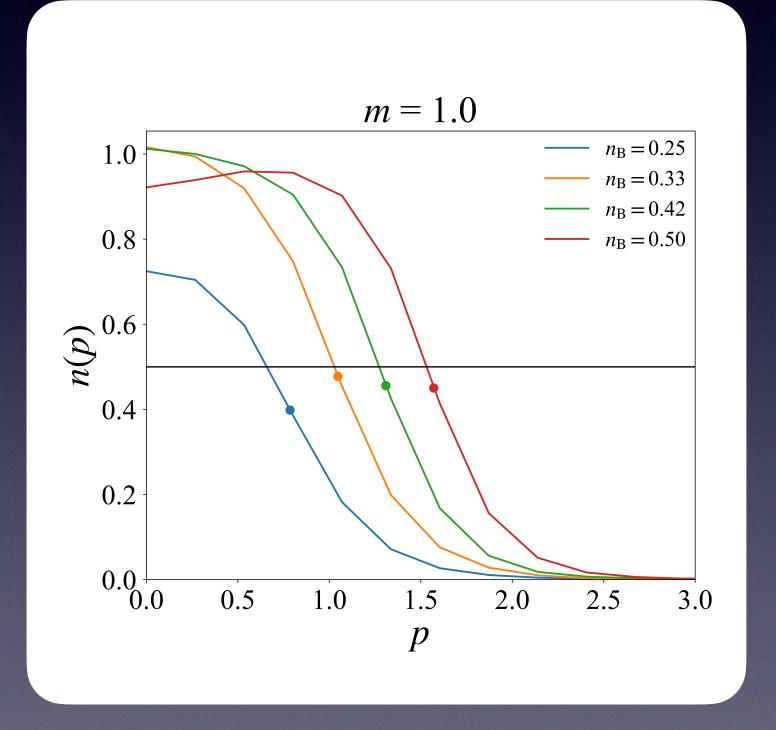

$$J = 1/8$$
 $w = 2$ $V = 12$ dim $\mathcal{H} = 2^{144}$

density wave

Wave number dependence Quark distribution

Baryon quark transition around $n_R = 0.3$?

Summary

- We study QCD_2 at finite density with one flavor for two and three colors.
- We employ Hamiltonian formalism
 and density matrix renormalization group techniques
- We find inhomogeneous phases both two and three colors.
