# **US-AUP RFD Testing**

A. Castilla, N. Huque, P. Owen – Jefferson Lab
S. De Silva, J Delayen - ODU
P. Berrutti, M. Narduzzi, C. Narug, L. Ristori - FNAL

13th HL-LHC Collaboration Meeting. - Sep. 25th-28th 2022

![](_page_0_Picture_4.jpeg)

![](_page_0_Picture_5.jpeg)

# Prototypes (NRFDP001 & 2)

- 2 prototypes manufactured by ZRI in 2020.
- Rotational BCP at ANL/FNAL facility (ave. removal 130+40 um).
- 600 C for 10 h heat treatment performed at FNAL.
- 1<sup>st</sup> HPR+Assy.+test at FNAL.

![](_page_1_Picture_5.jpeg)

Jefferson Lab A. Castilla et al

13th HL-LHC Collaboration Meeting. - Sep. 25th-28th 2022

# **NRFDP001 Bare Cavity Test Results**

![](_page_2_Figure_1.jpeg)

- $Q_0 = 8.2E9 V_t = 4.18 MV$  at quench, Low field  $Q_0 = 1.5E10$ ,  $B_{ext} = 0.6 mG$ .
- No FE detected: effective HPR and clean assembly

US HL-ĨHC

- OST indicates quench spot between corner and end-cap weld and optical inspection showed defect in the quench area (final weld).
- This cavity was sent to ZRI for complete re-processing in order to validate their procedures and improve the cavity performance.

# Latest NRFDP001 VT: Inconclusive

A. Netepenko & L. Ristori (FNAL)

![](_page_3_Figure_2.jpeg)

- A recent test at FNAL after re-processing at ZRI, proved inconclusive due to an early FE onset and suspected multipacting.
- The cavity will be sent to Jefferson Lab to:
  - Test as is.
  - Open and inspect.
    - HPR and re-test.

US HL-LHC AUP

Jefferson Lab A. Castilla et

A. Castilla et al 13th HL-LHC Collaboration Meeting. – Sep. 25<sup>th</sup>–28<sup>th</sup> 2022

# **NRFDP002 Bare Cavity Test Results**

- Excellent results: hard quench at 5.8 MV, no detectable FE during the test.
- Low field <u>Q<sub>0</sub> exceeding 1.3E10, Q<sub>0</sub>(@4.1MV)=1E10</u>
- E<sub>peak</sub>= 59.7 MV/m B<sub>peak</sub>= 94 mT @ 5.8 MV (quench)

![](_page_4_Figure_4.jpeg)

# **Bare cavity (prototype 2) + HOMs Testing**

- Several iterations to our hardware/procedure to seal the cavity.
- Mixing hardware with US EU [and CERN] standard has not made it easier (full "hardware kits" to be provided by CERN for the series).
- Assembly prioritized seal over cleanliness.
- Full cycle sequence is well understood.

![](_page_5_Picture_5.jpeg)

### NRFDP002 1<sup>st</sup> test w/HOMs

### @2K:

- Low field  $Q_0 \approx 4.6E9$ .
- $Q_0(@4.1MV) \approx 3E9.$
- Max  $E_{peak}$ = 51 MV/m.
- Max  $B_{peak}$ = 80 mT.
- Power limited (150 W, no Quench).
- $R_{res} \approx 20 \text{ n}\Omega.$

![](_page_6_Figure_8.jpeg)

![](_page_6_Figure_9.jpeg)

- Early FE onset (~2.5 MV/m) consistent with assembly trade-offs.
- Indications extra losses:
  - Bad RF-gasket contact (dejavu?)

13th HL-LHC Collaboration Meeting. - Sep. 25th-28th 2022

# NRFDP002 2<sup>nd</sup> test w/HOMs

#### @2.15K:

- Low field  $Q_0 \approx 6E8$ .
- Max  $E_{peak} \approx 21$  MV/m.
- Max  $B_{peak} \approx 33$  mT.
- No change in Q between 4 K and 2 K
- $R_{sur} \approx 175 \text{ n}\Omega.$
- Early FE onset = dirty assy.

Jefferson Lab

![](_page_7_Figure_8.jpeg)

- A superfluid leak (~5E-5 torr) limited the FWD power (25 W) at 2 K.
- Vacuum conditions were stable at 2.15K but we were still power starved at 2 MV due to large reflections (~85 W FWD).
- At this point is more than sure that the poor RF shielding on the HHOM RF gasket is the culprit of our high losses (learned from LARP).

### **NRFDP002 test w/HOMs**

Amongst the different problems to solve we had:

- Improvement on the cleaning and assembly procedure needed to reduce FE onset.
- Understanding on the Qext for the VHOM is necessary.
- Poor RF contact on the HHOM RF gasket:
  - Needed new hardware to sustain higher torques.
  - Needed a new procedure to ensure full compression of the RF gasket.

![](_page_8_Figure_7.jpeg)

-LHC

# Flange Connection Measurements (1)

- Nominal values in the table.
- When the flange gap reaches zero, the lips would be compressed by 0.2mm and desirable RF contact can be achieved.

![](_page_9_Picture_3.jpeg)

Quantity	Value (mm)
Cavity Flange Thickness	19.7
HHOM Flange Thickness	15.01
Total	<u>34.71</u>
Nominal Nb Gap	2.4
Seal Lip Height (+/-0.1)	2.6

![](_page_9_Picture_5.jpeg)

13th HL-LHC Collaboration Meeting. – Sep. 25th–28th 2022

# Flange Connection Measurements (2)

- Dry assy. tested w/pressure sensitive paper on the RF lips.
- At appropriate torque, the paper showed contact and a uniform crush.
- The maximum thickness of the paper (4 plies in total: 2x top + 2x bottom) is 0.22 mm. The effective thickness will be less due to compression.
- After disassembly, the gasket lips were measured and found to be 2.41mm (originally 2.6 mm), indicating that they were definitely crushed enough to plastically deform the lips.
- Successfully repeated dry assy. using A286 SS socket bolts and Ag-coated nuts to reach higher torques and smaller gap.
- This configuration was adopted as baseline for subsequent VT's.

Quantity	Nominal	Measured
Flange Thickness	34.71	34.82
Flange Gap	0	0.11
Nb Gap	2.76	2.51
RF Seal gap		
(calculated)		-0.09

![](_page_10_Picture_10.jpeg)

### NRFDP002 3rd test w/HOMs

- The unfortunate coupling of the VHOM introduces a huge uncertainty to the Q-measurement. ( $Q_0 \approx 2.6E10+/-1.1E10$ )
- At least there is no obvious performance reduction from the bare cavity.
- $Q_0(4.1 MV) \approx 2.7E10 + /-1.7E10$  and max  $V_T \approx 6.37 + /-0.31$  MV.
- Total fundamental power leakage from both couplers remains below the 12.5 W threshold at 4.1 MV (~10 W).

![](_page_11_Figure_5.jpeg)

# VHOM Coupler Waveguide Stub Geometry Tolerance On Power Leakage

![](_page_12_Figure_1.jpeg)

Not sensitive to stub horizontal shift Stub vertical tilt need be < 1 mm to limit power leakage to under 10 W

![](_page_12_Picture_3.jpeg)

**Output Port** 

Network Analyzer Port 1 Port 2

### **RF Box measurements:**

- Two RF test boxes designed and fabricated by ODU
- Both test box cans and test probes were qualified with detailed CMM data and no effect on fabrication offsets
- 2 HHOM dampers sets were measured and qualified with the CERN mask
  - Prototype set 1: HHOM3+FT2 was used in RFD2 VTA cold test
- Prototype 1 (HHOM3+FT2): FT2 were trimmed to lower the notch → To reduce fundamental power
- FTs will not be modified for pre-series and series sets

![](_page_14_Figure_9.jpeg)

# NRFDP002 2 K HOMs meas.

- Good fundamental rejection and trans. of HOMs of interest (e.g. '750 MHz').
- $Q_L$  calculated from  $S_{21}$  at 2 K using test input and HHOM coupler.

13th HL-LHC Collaboration Meeting. – Sep. 25th–28th 2022

# Summary

- LARP experience extremely valuable!
- Mixing hardware & standards made for a bumpy start.
- Hardware (for the prototypes) and procedures are finetuned.
- Hardware ("kits") for production to be provided by CERN.
- A set of HHOM and VHOM prototypes validated by warm and cold measurements.
- No evident reduction in performance or field reach observed on the cavity (prototype 2) from the HOM couplers.
- Next: Jacketed cavity! (prototype 2).
- Prototype 1 waiting for validation.
