

Food for thoughts

Where shall we go for FedID in the scientific community?

- Converging towards what? Or for multiple solutions in parallel?
- Is the “academic way” OK? Or look what Facebook and Google do?
- How could the IT industry help us?

Security is inherently complex

- Does the level of security required justify effort needed?
- Can we overcome legal requirements? Privacy? Data Protection?

Remember who are the stakeholders

- Users: will they ever understand SSO?! (did they for X.509?)
- Deployers: can organisations easily join and deploy?
- Developers:
How to avoid development for the purpose of development?

(with input from Philip Kershaw)
