

Workshop summary: Heavy flavour aspects in EFT - semileptonic decays -

Biljana Mitreska
TU Dortmund

6th General Meeting of the LHC EFT working group
17.11.2023

① LHC EFT workshop: SL decays

② $b \rightarrow u$ transitions

③ $b \rightarrow c$ transitions

1 LHC EFT WG Area 6: Heavy flavour aspects in EFT | 2

- ▶ Dedicated meeting on **Heavy flavour aspects in EFT in semileptonic decays** on 24.04.2023 : [▶ indico](#)
- ▶ Theory and experimental(LHCb) contributions on $b \rightarrow u\ell\nu$ and $b \rightarrow c\ell\nu$ transitions
- ▶ Discussion on current/ongoing measurements and prospects

LHC EFT WG Area 6 meeting: Heavy flavour aspects in EFT

Monday 24 Apr 2023, 14:00 → 18:00 Europe/Zurich
6/2-024 - BE Auditorium Meyrin (CERN)
Admir Grejlo (Universität Bern (CH)), Christoph Michael Langenbruch (Heidelberg University (DE)), Gregory Max Ciezarek (CERN)

Videoconference LHC EFT WG Area 6 meeting: Heavy flavour aspects in EFT

14:00 → 14:30 **V_{cb} determination at LHCb** ⌚ 30m
Speaker: Michel De Cian (Heidelberg University (DE))
[eft.pdf](#)

14:40 → 15:10 **$b \rightarrow u\ell\bar{\nu}_\ell$ in WEFT** ⌚ 30m
Speaker: Meril Reboud
[Reboud_240423.pdf](#)

15:20 → 15:40 **Coffee break** ⌚ 20m

15:40 → 16:10 **$b \rightarrow c\ell\bar{\nu}_\ell$ at LHCb** ⌚ 30m 
Speaker: Biljana Mitreska (Technische Universität Dortmund (DE))
[LHC_EFT_2023_ML...](#)

16:20 → 16:50 **$b \rightarrow c\ell\bar{\nu}_\ell$ distributions from theory** ⌚ 30m
Speaker: Dean Robinson (Lawrence Berkeley National Laboratory (LBL))
[bc_theory.pdf](#)

- ① LHC EFT workshop: SL decays
- ② $b \rightarrow u$ transitions
- ③ $b \rightarrow c$ transitions

- ▶ V_{ub} measurements at LHCb: [talk by Michel de Cian](#)
- ▶ Two main ways to measure $|V_{ub}|$
- ▶ **Exclusive:** using $B^+ \rightarrow \pi^+ \mu^- \bar{\nu}_\mu$, possibly small signal yields
- ▶ **Inclusive:** $B^{0/+} \rightarrow X_u \mu^{+/-} \bar{\nu}_\mu$, large background contamination
- ▶ Different form factor uncertainties in every $b \rightarrow u$ transition

2 V_{ub} from Λ_b^0 at LHCb

| 5

- ▶ V_{ub} probed using $\Lambda_b^0 \rightarrow p\mu^-\bar{\nu}_\mu$ ($q^2 > 15\text{GeV}^2$)

$$|V_{ub}| = R_{FF} \frac{B(\Lambda_b^0 \rightarrow p\mu^-\bar{\nu}_\mu)}{B(\Lambda_b^0 \rightarrow \Lambda_c^+\mu^-\bar{\nu}_\mu)} |V_{cb}|$$

- ▶ Exclusive $|V_{cb}|$ world average used as input, R_{FF} from [PRD 92\(2015\)034503](#)
- ▶ Main systematic uncertainties coming from the choice of normalisation channel

Source	Relative uncertainty (%)
$B(\Lambda_c^+ \rightarrow pK^+\pi^-)$	+4.7
Trigger	-5.3
Tracking	3.2
Λ_c^+ selection efficiency	3.0
$\Lambda_b^0 \rightarrow N^*\mu^-\bar{\nu}_\mu$ shapes	2.3
Λ_b^0 lifetime	1.5
Isolation	1.4
Form factor	1.0
Λ_b^0 kinematics	0.5
q^2 migration	0.4
PID	0.2
Total	+7.8
	-8.2

- ▶ Possibility of using non semileptonic decay ($\Lambda_b \rightarrow p\pi$), depending on external measurements on BFs

2 V_{ub} from B mesons

| 6

- ▶ Measure $\frac{V_{ub}}{V_{cb}}$ from $B_S^0 \rightarrow K^- \mu^+ \nu_\mu$ with $B_S^0 \rightarrow D_S^- \mu^+ \nu_\mu$ as normalisation

- ▶ Two values of V_{ub} measured depending on the FF predictions: for low q^2 (LCSR) and high q^2 (LQCD)
- ▶ Need to perform differential measurements to understand shape better
- ▶ Ongoing work on V_{ub} with $B^+ \rightarrow \rho^0 \mu^+ \nu$ and $B^+ \rightarrow D^0 \mu \nu$: same final state for signal and normalisation

2 V_{ub} from B mesons

| 7

- ▶ Determine consistency of exclusive data and quality of V_{ub} extraction:

▶ talk by M ril Reboud

Data set	Goodness of fit			$ V_{ub} \times 10^3$
	χ^2	d.o.f.	p value [%]	
$\bar{B} \rightarrow \pi \ell \nu$	27.83	31	62.98	$3.79^{+0.15}_{-0.15}$
$\bar{B} \rightarrow \rho \ell \nu$	5.08	10	88.60	$2.63^{+0.25}_{-0.22}$
$\bar{B} \rightarrow \omega \ell \nu$	3.19	4	52.66	$2.74^{+0.33}_{-0.28}$
all data	52.31	47	27.53	$3.50^{+0.13}_{-0.12}$

- State-of-the-art determinations:

- Inclusive [HFLAV, PDG, ... '22]
 $|V_{ub}| = 4.13(12)(13)(18) 10^{-3}$
- Exclusive [HFLAV, PDG, ... '20]
 $|V_{ub}| = 3.70(10)(12) 10^{-3}$

- ▶ Discussion between theory and experiment on how to exchange the non-gaussian likelihoods, observables and hadronic inputs from these measurements

- ▶ Tension present in the inclusive vs exclusive V_{ub} extraction
- ▶ Floating Wilson coefficients in the fit yields better $b \rightarrow u \ell \nu$ fit (from Bayesian model comparison)
- ▶ Performing full angular analysis with floating New Physics operators will bring more insights

- ① LHC EFT workshop: SL decays
- ② $b \rightarrow u$ transitions
- ③ $b \rightarrow c$ transitions

- ▶ Overview of differential measurements at LHCb [▶ talk by Biljana Mitreska](#)
- ▶ LHCb has an ongoing effort in angular analyses in each channels measuring: angular coefficients, CP observables, Wilson coefficients and form factor parameters (BGL, BLPR, CLN)

- ▶ Theory community welcomes the range of differential measurements at LHCb (particularly direct measurement of angular coefficients and Wilson coefficients)
- ▶ Need to find a common solution with theorists on publishing the data together with the results ($B \rightarrow D^* \mu(\tau)\nu$)

3 $b \rightarrow c\ell\nu$: comments on using BGL

SM fit with BGL

- Belle and BaBar measure 5 BGL parameters
- Current LHCb analysis aims for 9 BGL parameters

• PRD 100, 052007 (2019)

• PRD 103, 079901 (2019)

• CERN-THESIS-2022-105

Parameters	Stat. uncertainty LHCb Run I
a_0	6.0e-05
a_1	5.0e-03
a_2	9.0e-02
b_1	6.0e-04
b_2	1.5e-02
c_1	8.0e-05
c_2	1.2e-03
d_0	1.4e-02
d_1	2.5e-01

- ▶ Evaluate uncertainty due to series truncation in BGL
- ▶ Evaluate if the fitted coefficients saturate unitarity bounds
- ▶ When measuring New Physics contributions BGL is preferred over BLPR and CLN (model dependent)

3 $b \rightarrow c\ell\nu$: discussion on New Physics

- ▶ LFU interpretation in $b \rightarrow c\ell\nu$ ▶ talk by Dean Robinson

$$\begin{aligned}
 H_{eff} &= \frac{4G_F}{\sqrt{2}} V_{cb} \sum_i C_i O_i \\
 &= \frac{4G_F}{\sqrt{2}} V_{cb} [(1 + C_{VLL}) O_{C_{VLL}} + C_{VRL} O_{C_{VRL}} \\
 &\quad + C_{VLR} O_{C_{VLR}} + C_{VRR} O_{C_{VRR}} + C_{SLL} O_{C_{SLL}} \\
 &\quad + C_{SRL} O_{C_{SRL}} + C_{SLR} O_{C_{SLR}} + C_{SRR} O_{C_{SRR}} \\
 &\quad + C_{TLL} O_{C_{TLL}} + C_{TRR} O_{C_{TRR}}] + h.c.,
 \end{aligned}$$

- ▶ 5 complex WCs to consider (assuming left-handed neutrino)
- ▶ Simplified models with a single heavy mediators

EW doublet (H_2)

S_L, S_R

W'

V_L

Scalar/Vector LQ ($U_{1,3}, S_{1,3}, R_2, V_2$)

$V_L, S_R, S_L \pm 4T$

- ▶ Standard analysis workflow

3 $b \rightarrow c\ell\nu$: discussion on New Physics

- ▶ Mismatch in WC subspace

Fit each NP Template to SM truth:
Closure with zero
NP as expected!

Fit each NP Template to 2HDM
 $S_{qLR} = -2$.
Mismatched templates might obfuscate or wrongly identify NP!

- ▶ SM null test could be limited by possible NP biases
- ▶ Suggestion to 'redo' the measurements using NP templates to account the NP model
- ▶ Impractical to have 20 dimensional space of NP Wilson coefficients
- ▶ Quantify the fit templates biases with a fixed NP model
- ▶ To be discussed with theorists which is the optimal model to use

3 Summary

- ▶ Inclusive vs exclusive determination of V_{ub} and V_{cb} subject to constraints if New Physics is accounted in the fit
- ▶ Clear effect of the choice on the normalisation channel (in systematic uncertainties)
- ▶ When fitting for LFU observables estimate biases due to New Physics in the fit templates
- ▶ Need to decide on a common solution between theory and experiment on how to publish the data + results of the many analyses in $b \rightarrow c\ell\nu$ transitions

Thank you!
