

The DL Advocate: Playing the devil's advocate with hidden systematic uncertainties - Poster

Thursday 1 February 2024 16:25 (5 minutes)

We propose a new method based on machine learning to play the devil's advocate and investigate the impact of unknown systematic effects in a quantitative way. This method proceeds by reversing the measurement process and using the physics results to interpret systematic effects under the Standard Model hypothesis. We explore this idea with two alternative approaches, one relies on a combination of gradient descent and optimisation techniques, the other employs reinforcement learning. We illustrate the potentiality of the presented method by considering two examples, firstly the case of a branching fraction measurement of the decay of a b-hadron, secondly the determination of the P_5' angular observable in $B^0 \rightarrow \mu^+ \mu^-$ decays. Based on <https://arxiv.org/abs/2303.15956>

Would you like to be considered for an oral presentation?

Authors: INIUKHIN, Aleksandr (National Research University Higher School of Economics (RU)); MAURI, Andrea (Imperial College (GB)); GOLUTVIN, Andrei (Imperial College London); USTYUZHANIN, Andrey (Yandex School of Data Analysis (RU)); HIJANO MENDIZABAL, Guillermo (University of Zurich (CH)); SERRA, Nicola (University of Zurich (CH)); OWEN, Patrick Haworth (University of Zurich (CH))

Presenter: HIJANO MENDIZABAL, Guillermo (University of Zurich (CH))

Session Classification: Poster Session

Track Classification: 2 ML for analysis : event classification, statistical analysis and inference, including anomaly detection
