

# EPOL Summary

**Jacqueline Keintzel, Eric Torrence and Guy Wilkinson**

On behalf of the  
FCC-ee EPOL working group

[jacqueline.keintzel@cern.ch](mailto:jacqueline.keintzel@cern.ch)

[guy.wilkinson@cern.ch](mailto:guy.wilkinson@cern.ch)

**FCC Week 2024**  
San Francisco, California, USA  
14 June 2024

**FCCIS – The Future Circular Collider Innovation Study.**  
This INFRADEV Research and Innovation Action project receives funding from the European Union's H2020 Framework Programme under grant agreement no. 951754.

# FCC-ee Overview

## Particle Physics:

- Higgs and electro-weak factory
- 4 baseline beam energies and diverse particle physics program
  - 45.6 GeV: Z-pole
  - 80 GeV: W-pair-threshold
  - 120 GeV: ZH-production
  - 182.5 GeV: top-pair-threshold
- High number of statistics

## Accelerator Physics:

- 4-fold super-symmetric layout
  - Up to 4 Interaction Points (IPs)
  - 1 RF-section per beam
  - 1 collimation section
  - 1 section for injection and dump
- Nanometer beam size at IPs
- Strong synchrotron radiation

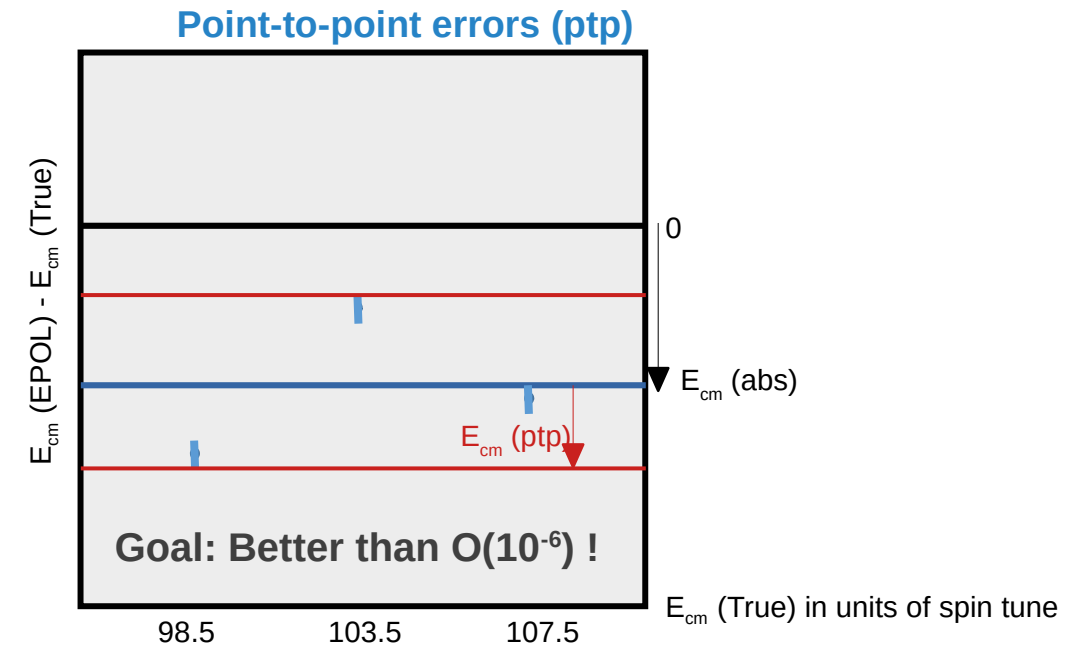

Precision particle physics experiments ↔ Center-of-mass energy determination

# Center-of-mass Energy Uncertainty

Error between measured and true  $E_{cm}$

- Large effect on mass measurement
- Stems from systematic errors

Fluctuation between measurements

- Large effect on resonance width measurements
- Stems from variability of measurement conditions

Courtesy: A. Blondel

# Expected Precision

Quantity	statistics	$\Delta E_{CMabs}$ 100 keV	$\Delta E_{CMSyst-ptp}$ <b>40 keV</b>	calib. stats. $200 \text{ keV} / \sqrt{(N^i)}$	$\sigma E_{CM}$ (84) $\pm$ <b>0.05</b> MeV
$m_Z$ (keV)	<b>4</b>	100	<b>28</b>	1	–
$\Gamma_Z$ (keV)	<b>4</b>	2.5	<b>22</b>	1	<b>10</b>
$\sin^2 \theta_W^{\text{eff}} \times 10^6$ from $A_{FB}^{\mu\mu}$	<b>2</b>	–	<b>2.4</b>	0.1	–
$\frac{\Delta \alpha_{QED}(M_Z)}{\alpha_{QED}(M_Z)} \times 10^5$	<b>3</b>	0.1	<b>0.9</b>	–	<b>0.05</b>

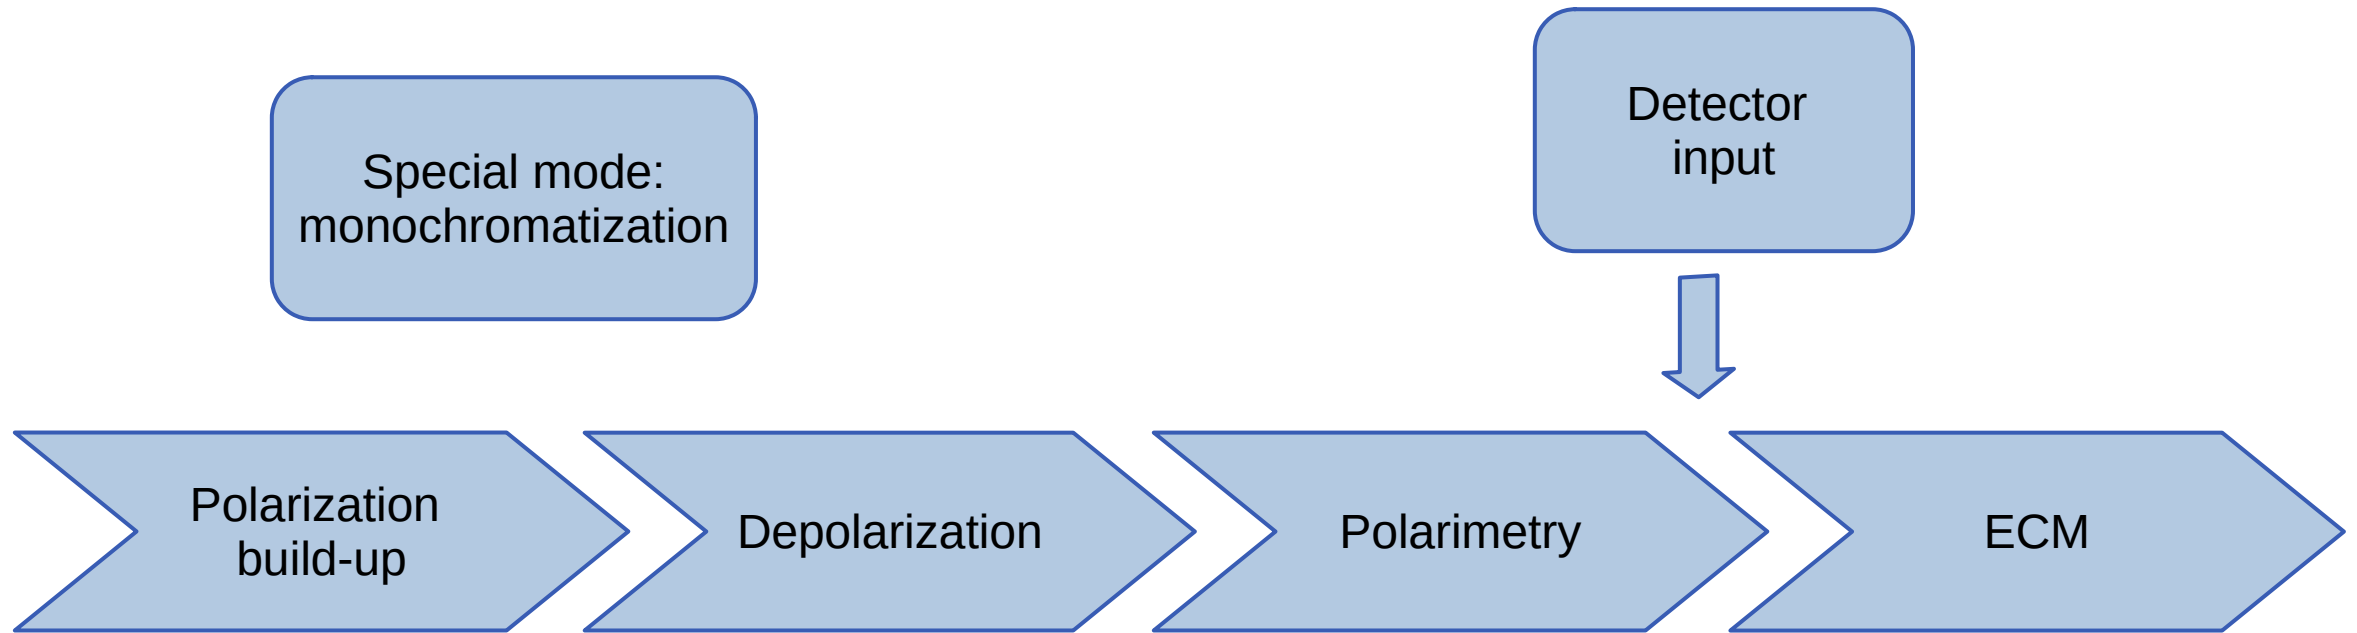

Huge statistics → small statistical error of a **few keV for Z and W-boson**

Aim to achieve same order of magnitude for systematic (**ptp**) errors → Scope of the **EPOL working group**

EPOL: Energy calibration, polarization and monochromatization

arXiv:1909.12245

# How to?

- Resonances
- Wigglers
- Beam tests

- Resonant depolarization
- Free spin precession

- Polarimeter incl. laser, Si-detectors
- e.g. EIC experience

- Systematic errors
- Statistical errors
- Accurate models

# Sessions Overview

**Thursday 13:30 – 15:00**

Introduction and overview  
Speaker: Guy Wilkinson

Polarized positron production  
Speaker: Joseph Grames

Experiments at existing facilities  
Speaker: Jacqueline Keintzel

The EIC polarimeter and lessons for the FCC  
Speaker: Dave Gaskell

**Thursday 15:30 – 17:00**

Simulation polarization studies at the FCC  
Speaker: Yi Wu

Polarized electrons at the EIC, lessons for the FCC  
Speaker: Georg Hoffstaetter

The FCC polarimeter  
Speaker: Robert Kieffer

First thoughts on the FCC depolarizer  
Speaker: Wolfgang Höfle

Lessons from LEP and final steps towards the final report of the FS, Speaker: Eric Torrence

# Polarization Build-Up

More likely  
(by factor ~25)

Less likely

- Statistically every  $10^{10\text{th}}$  emitted synchrotron photon flips the spin
- Probability depends on the initial spin orientation
- Leads to a natural **polarization build-up** over time
- Orientation is **anti-parallel** to the guiding magnetic field
- Maximum theoretical polarization of **92.4 %**
- Spin precesses through the lattice → Spin tune

$$\nu = a * \gamma_{\text{Rel}}$$

$a$  ... gyro-magnetic anomaly  
 $\gamma_{\text{Rel}}$  ... Lorentz-factor

# Tasks for Remainder of FS

Introduction and Overview  
Speaker: Guy Wilkinson

- Ensure sufficient polarisation in optics, including HSM studies at Z & WW
- Procedure, systematics and ultimate precision on RDP & FSP measurements
- Inform studies through series of measurements at KARA (and other accelerators)
- Arrive at full conceptual design of polarimeter, including infrastructure
- Full costing of EPOL related items
- Wigglers vs polarisation ring (injecting polarised  $e^-/e^+$  increasingly attractive possibility – is it feasible ?)
- Requirements on depolariser and agreement on depolarisation procedure for pilot and physics bunches
- Deepen understanding of IP-specific corrections, in particular dispersion and offset effects
- Improve understanding of input from experiments, e.g. effect of higher-order corrections and detector resolutions *etc.* in  $e^+e^- \rightarrow f\bar{f}(\gamma)$  studies
- Establish feasibility and expected performance of monochromatisation scheme for electron Yukawa run

# Tasks for Remainder of FS

Introduction and Overview  
Speaker: Guy Wilkinson

Courtesy: J. Heron

Injection of polarized beams could increase integrated luminosity by up to ~35%

• W wigglers vs polarisation ring (injecting polarised  $e^-/e^+$  increasingly attractive possibility – is it feasible ?)

monochromatisation in optics, especially at Z & WW  
 optics and ultimate FSP measurements  
 long series of ARA (accelerator related items)  
 physical design including infrastructure

- Requirements on depolariser and agreement on depolarisation procedure for pilot and physics bunches
- Deepen understanding of IP-specific corrections, in particular dispersion and offset effects
- Improve understanding of input from experiments, e.g. effect of higher-order corrections and detector resolutions *etc.* in  $e^+e^- \rightarrow f\bar{f}(\gamma)$  studies
- Establish feasibility and expected performance of monochromatisation scheme for electron Yukawa run

# Monochromatization

Tuesday, 11 June, 10:30 – 12:00

Monochromatization optics for FCC-ee  
Speaker: Angeles Faus-Golfe

- 62.5 GeV beam energy → peak of Higgs-production
- For minimization of collision energy spread → monochromatization
- Trade-off between collision energy spread and luminosity production

## Introducing dispersion

$e^+$  Same sign dispersion at the interaction point leads to change of  $E_{CM}$

$e^+$  Opposite sign (horizontal) dispersion helps reducing  $E_{CM}$  spread

4 MeV spread ↔  $18 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$ , possible optimization

# Polarized Positron Source

- Polarized Electrons for Polarized Positrons (PEPPo)
- Designed for CEBAF
- Polarized electrons based on GaAs
- Polarized positrons from polarized electrons

Parameter	CEBAF 12 GeV Electron Beam	Proposed 12 GeV Positron Beam
Experiment Intensity	10 nA - 170 $\mu$ A	> 50 nA (pol) > 1 $\mu$ A (unpol)
Duty Factor	100% (cw)	same
Bunch Frequency	249.5/499 MHz	same
Spin Polarization	>85%	>60%
Rapid Spin Reversal	30 – 2000 Hz (Pockels cell)	same

Polarized positron production  
Speaker: Josef Grames

$$\vec{e}^- \rightarrow \gamma \rightarrow \vec{e}^+ (+ \vec{e}^-)$$

*When a longitudinally polarized  $e^-$  beam strikes matter,  $e^+$  produced in the shower carrying >50% of the  $e^-$  beam energy are significantly longitudinally spin polarized...*

# Experience at KARA

- RDP measurement campaign at KARA
- Findings consistent with simulations for FCC
- Low measurement fit error of a few keV

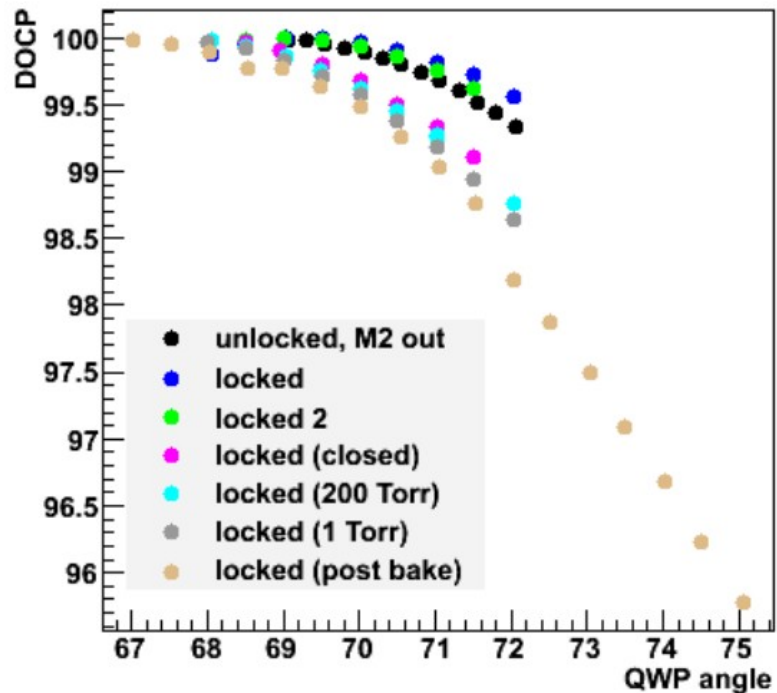

Courtesy: S. Nikitin, I. Koop

Experiments at existing facilities  
Speaker: Jacqueline Keintzel

# EIC and FCC Polarimeters

The EIC polarimeter and lessons for the FCC  
Speaker: Dave Gaskell

- Common issues:
  - Beam structure: short times between bunches
  - Synchrotron radiation issues
  - Laser diagnostics

# Polarization and Misalignments

- Element misalignments increase vertical orbit and decrease theoretical achievable polarization
- Large fluctuations between various error seeds

Orbit correction and polarization studies  
Speaker: Yi Wu

- 100 / 10  $\mu\text{m}$  in arcs / IRs  $\rightarrow 70 \pm 25 \%$  polarization

# Polarization Lessons from EIC

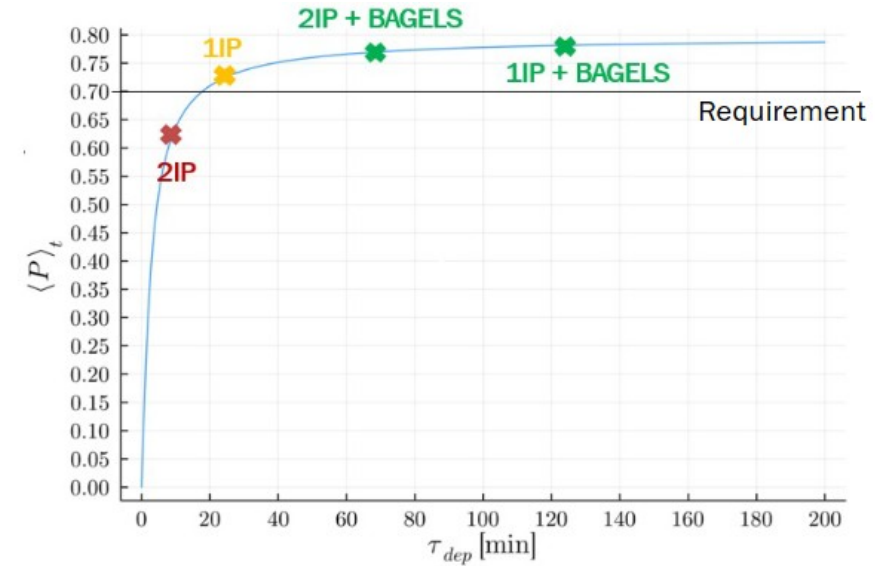

Polarized electrons at the EIC, lessons for the FCC  
Speaker: Georg Hoffstaetter

- Better polarization with errors observed
- → **Best Adjustment Groups for E**lectron **S**pin (BAGELS)

$$\begin{pmatrix} \partial \hat{n} / \partial \delta_1 \\ \vdots \\ \partial \hat{n} / \partial \delta_n \end{pmatrix}_f = \begin{pmatrix} \partial \hat{n} / \partial \delta_1 \\ \vdots \\ \partial \hat{n} / \partial \delta_n \end{pmatrix}_0 + \begin{pmatrix} \frac{\partial(\partial \hat{n} / \partial \delta)_1}{\partial \theta_1} & \dots & \frac{\partial(\partial \hat{n} / \partial \delta)_1}{\partial \theta_m} \\ \vdots & \ddots & \vdots \\ \frac{\partial(\partial \hat{n} / \partial \delta)_n}{\partial \theta_1} & \dots & \frac{\partial(\partial \hat{n} / \partial \delta)_n}{\partial \theta_m} \end{pmatrix} \begin{pmatrix} \theta_1 \\ \vdots \\ \theta_m \end{pmatrix} + \dots$$

n bends
m unit bumps

- “Eigenvectors” with **largest** “eigenvalues” have **maximum** impact on  $\partial \hat{n} / \partial \delta$
- “Eigenvectors” with **smallest** “eigenvalues” have **minimum** impact on  $\partial \hat{n} / \partial \delta$

## Polarization studies have changed many important features of today’s ESR

- 10 GeV Lattice Correction of 1IP/2IP **Operating Energies**
- ESR v5.3: Nonlinear Resonance Identified, **Tunes Changed**
- ESR v5.6: Partial Longitudinal Spin Match by **solenoid polarity change**

# FCC Polarimeter

- Laser should be accessed at all times
- Baseline would require additional CE
- Separation chamber length optimized
- Extraction window optimization:

Angle and material thickness

The FCC polarimeter  
Speaker: Robert Kieffer

## Base line: a single polarimeter per beam (2 total)

- Instrument location: both ends of LSS on each experimental IP A.
- Laser room should have a **24/7 access to insure availability.**
- **Needs dedicated laser hutch and access tunnels.**
- Energy at IPs is inferred from one measurement point.
- Energy loss (Tapering), along the ring **induce systematic errors** on the energy inferred at each IP.

# Depolarizer

First thoughts on the FCC depolarizer  
Speaker: Wolfgang Höfle

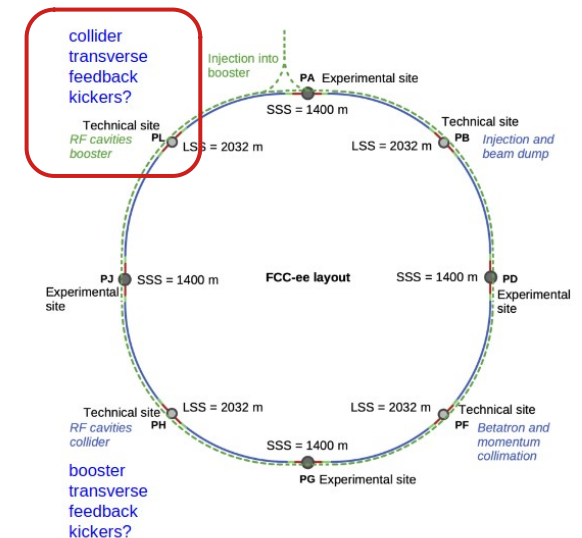

Magnetic field field (horizontal) D. Sittard

D. Sittard

- First detailed thoughts on depolarizer design have started
- Combined with transverse feedback system
- Minimum 3 location required to generate closed orbit bumps
- Optimum location to be found
- 10  $\mu$ rad kick at 45.6 GeV required
  - → challenging
  - → Closer to the beam
  - → Multiple depolarizers
  - → Best locations?

# From LEP to the End of the FS

Lessons from LEP and final steps towards the final Speaker: Eric Torrence

- Redundancy for beam energy measurements
- Especially at higher energies when RDP is more challenging
- RDP, physics measurements, free spin precession
  - LEP2 used 3 separate methods to extrapolate RDP

Flux loop

Synchrotron tune vs  $V_{RF}$

In-line spectrometer

Agreement lead us to believe  $dE_b/E_b = 10$  MeV uncertainty

# Outlook

- Presently aimed to achieve *a few keV* systematic (ptp) uncertainty at the *Z- / W- modes* → *EPOL*
- Important questions aimed to be investigated in the future, for example:
  - Could/should we aim to inject already polarized bunches?
  - What are the best locations for the depolarizer and the polarimeter?
  - ...

## Regular EPOL meetings:

[indico.cern.ch/category/8678/](https://indico.cern.ch/category/8678/)

Typically every third Thursday 16:30-18:30

## Mailing list:

[fcc-ee-PolarizationAndEnergyCalibration@cern.ch](mailto:fcc-ee-PolarizationAndEnergyCalibration@cern.ch)

## Self-subscription from:

# CEPC Polarization Scheme

Courtesy: Zhe Duan

- Injection of polarized electrons and positrons in collider rings at Z and W
- Longitudinal polarization for physics bunches
- Transverse polarization for pilot bunches
- More time for physics
- Possibly also polarized beams at H
