MSSM Higgs boson production

- Cover the 3 neutral Higgs $\phi = (h, H, A)$
 - charged Higgs results covered in other talk
- Large $\tan \beta$ is preferred, leads to enhanced coupling to down type quarks and leptons
- Production/decay mechanism
 - $\phi b \rightarrow bbb$
 - $\phi b \rightarrow \tau\tau b$
 - $\phi \rightarrow \tau\tau$
- Branching Ratios
 - $BR(\phi \rightarrow bb) \sim 90\%$
 - $BR(\phi \rightarrow \tau\tau) \sim 10\%$

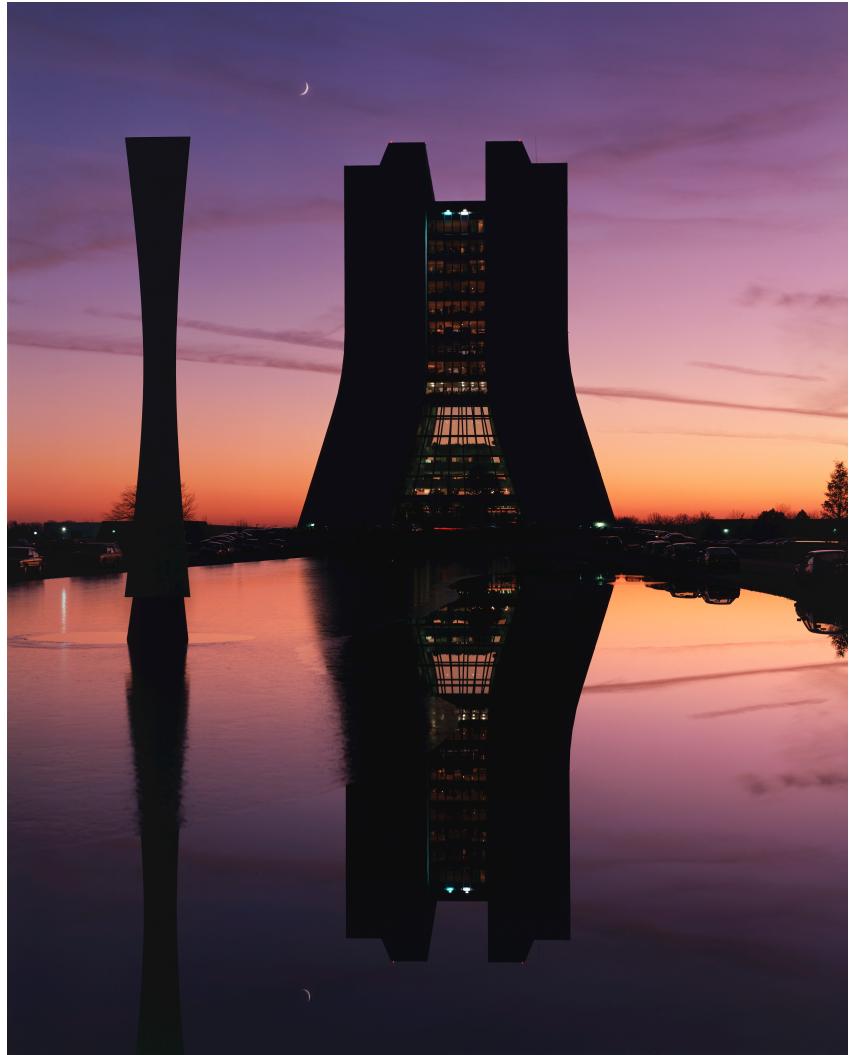

SUSY Parameters

- Tree level MSSM Higgs sector described by two parameters
 1. M_A
 2. $\tan \beta = \langle H_u \rangle / \langle H_d \rangle$
- Radiative corrections introduce dependence on other parameters
- Limits set in model independent case
- Excluded in $M_A, \tan \beta$ for two scenarios:

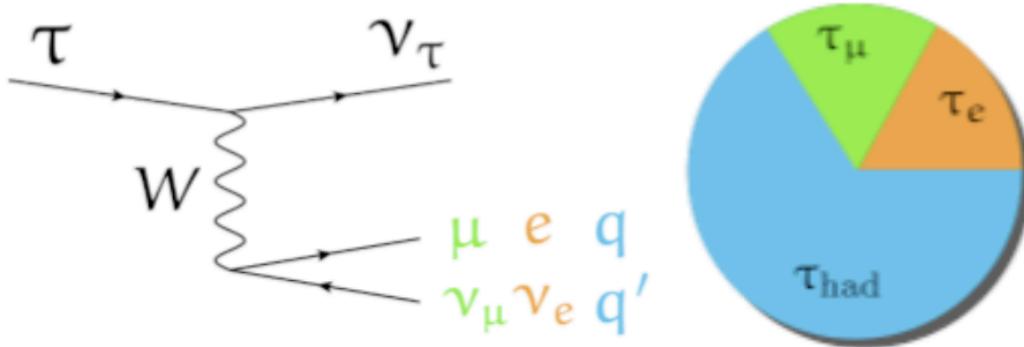

Parameter	m_h -max	no-mixing
μ	200 GeV	200 GeV
M_{SUSY}	1000 GeV	2000 GeV
X_t	2000 GeV	0 GeV
M_2	200 GeV	200 GeV
M_3	800 GeV	1600 GeV

Object Identification: Taus

- Different tools for leptonic and hadronic tau decay

- μ, e use standard leptonic identification tools
- hadronic tau decay --- large jet background

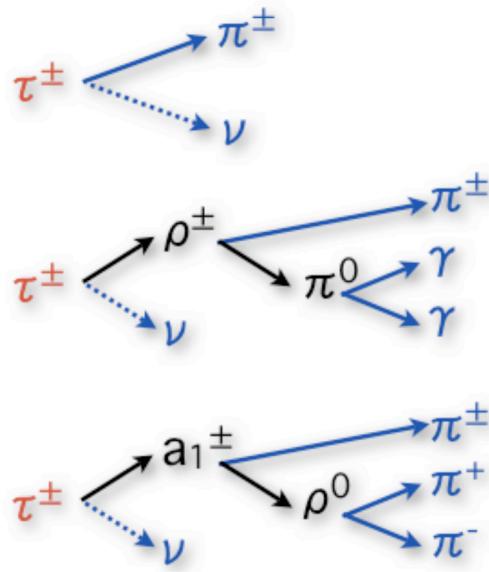

- D0 and CDF have specific identification tools

Object Identification: Taus

- Define 3 types due to decay products

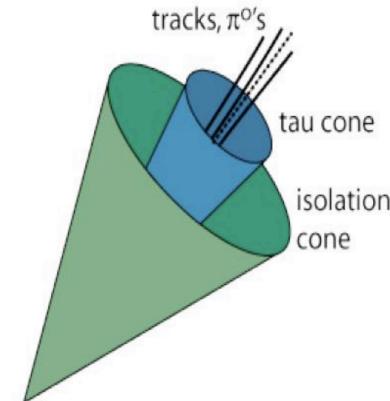

1 Track
Calorimeter cluster

1 Track
Calorimeter cluster
> 0 EM sub-cluster

> 1 Track
Calorimeter cluster
> 0 EM sub-cluster

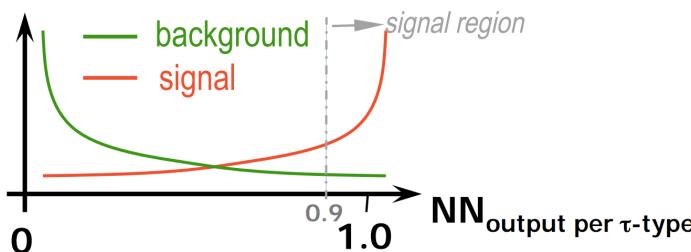

- Isolation cone

- Select 1 or 3 tracks in variable size and cone.

- Remove background with NN

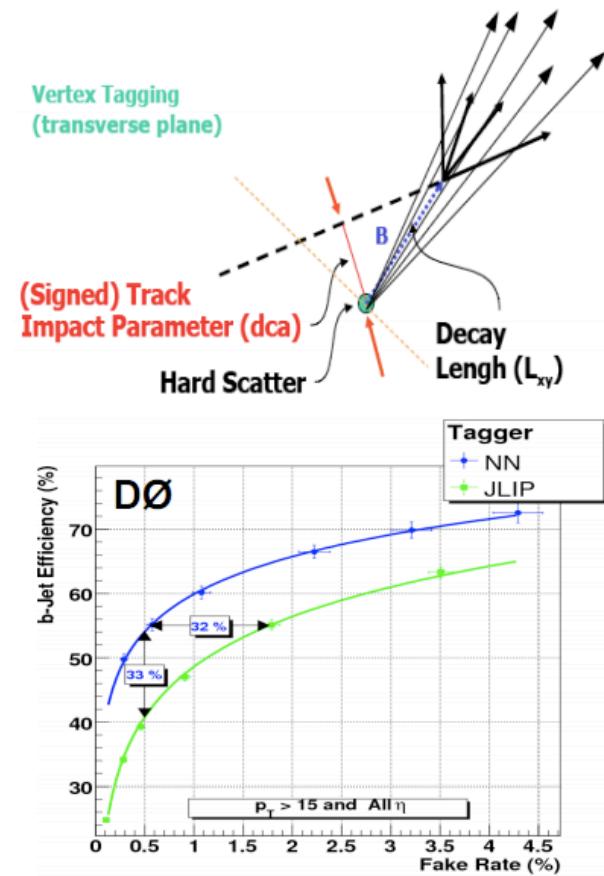

Efficiency = 65%	Fake rate = 2.5%
Efficiency = 50%	Fake rate < 1%

Object Identification: b-jets

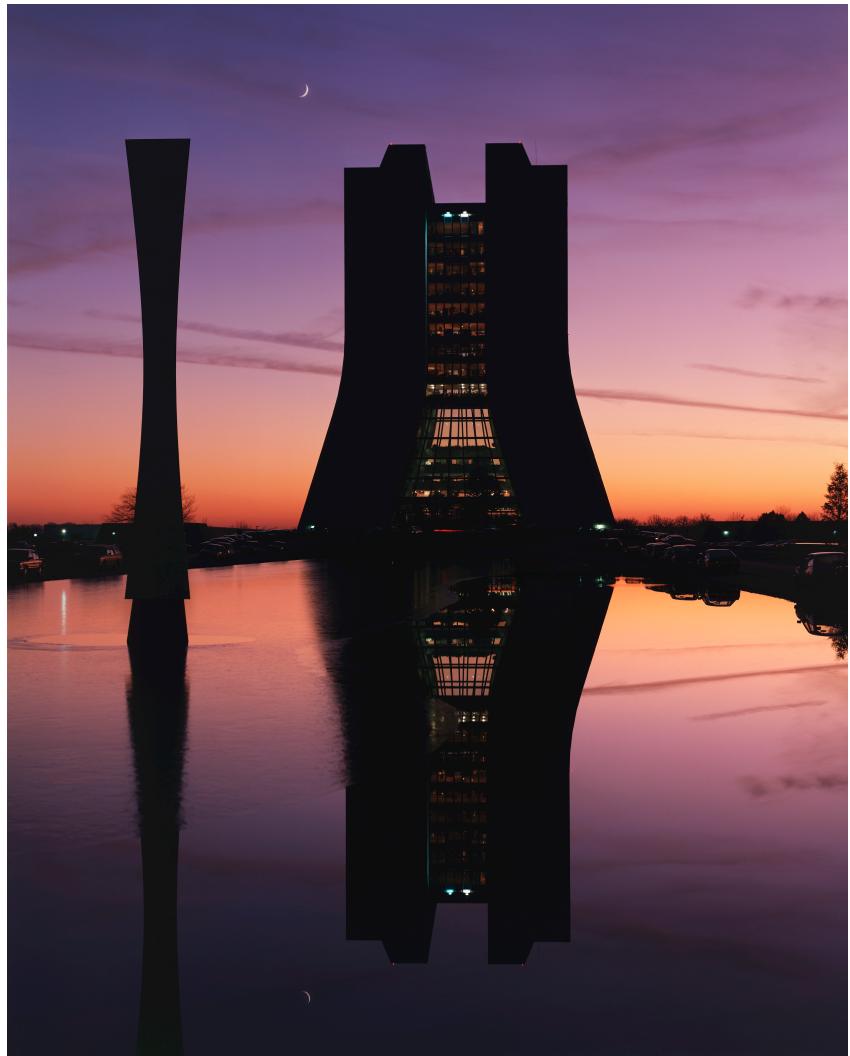

Use lifetime information – corrected for data MC differences

CDF: Secondary vertex reconstruction
NN increase purity
40% efficiency, 0.5% mis-tag

DØ: NN tagger
Secondary vertex and dca based inputs derived from basic b-tagging tools
High efficiency and purity
50% efficiency., 0.5% mis-tag

DØ and CDF Combination Inputs

- Last updated in 2009
- Using up to 2.2 fb^{-1} integrated luminosity
- Using just $\phi \rightarrow \tau\tau$ decays
- DØ: $\phi \rightarrow \tau_\mu \tau_{\text{had}}$
 - 2.2 fb^{-1} integrated luminosity
 - Released in 2008
 - combined with a DØ 1 fb^{-1} covering $\phi \rightarrow \tau_e \tau_\mu, \tau_e \tau_{\text{had}}, \tau_\mu \tau_{\text{had}}$
- CDF: $\phi \rightarrow \tau_e \tau_\mu, \tau_e \tau_{\text{had}}, \tau_\mu \tau_{\text{had}}$,
 - 1.8 fb^{-1} integrated luminosity
 - Released in 2009

DØ and CDF Combination Inputs

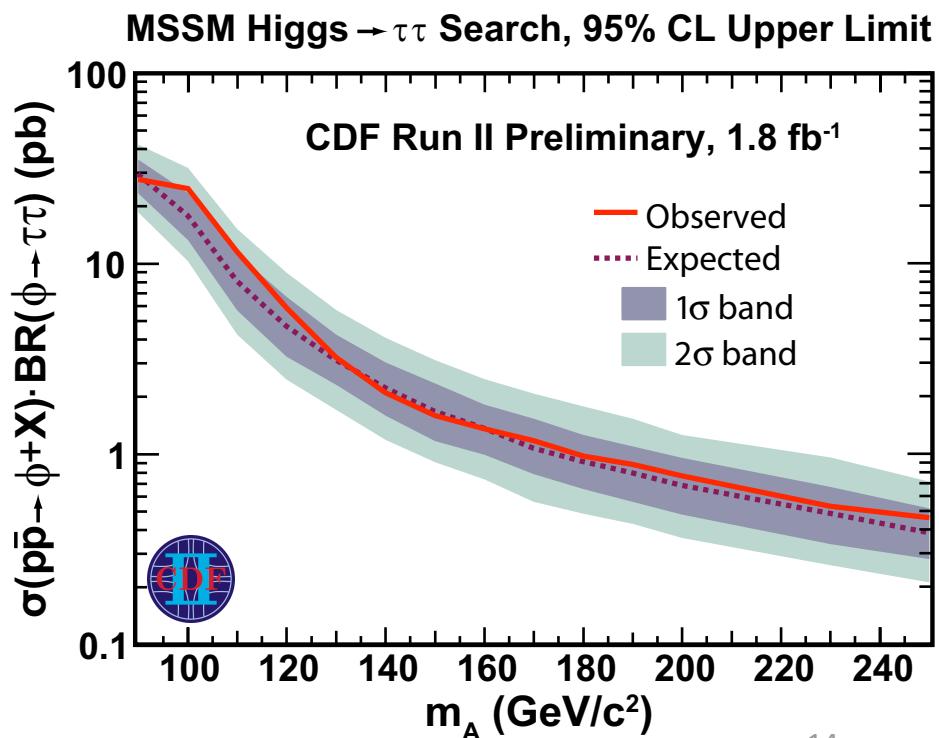

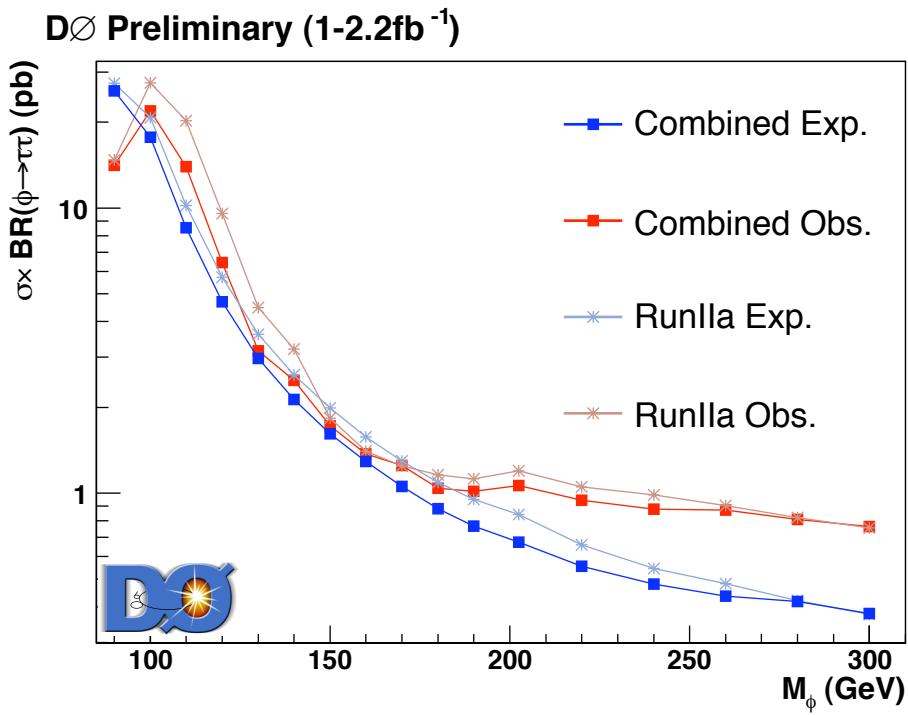

- Select two high P_t isolated leptons of opposite sign
- look for excess in

$$M_{vis} = \sqrt{(P_{\tau_1} + P_{\tau_2} + \cancel{P}_T)^2}$$

New 5.4 fb⁻¹ DØ result now out

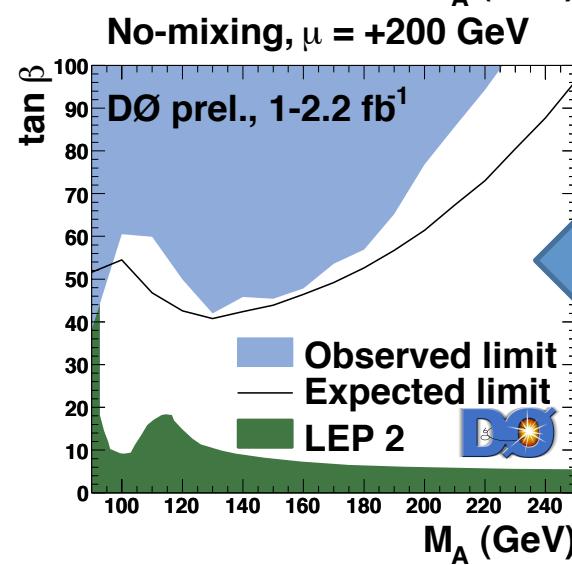

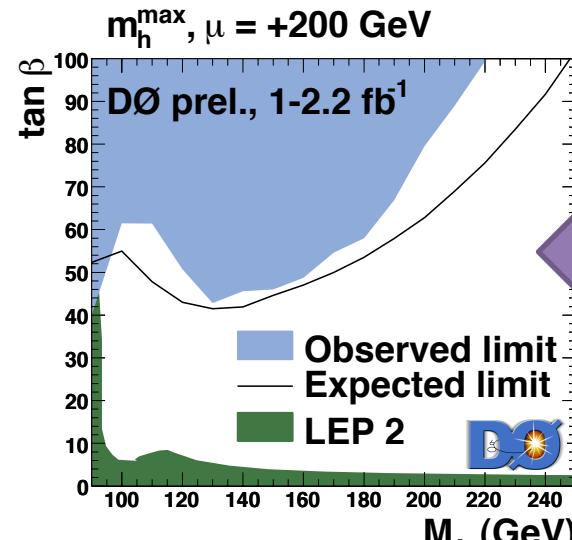

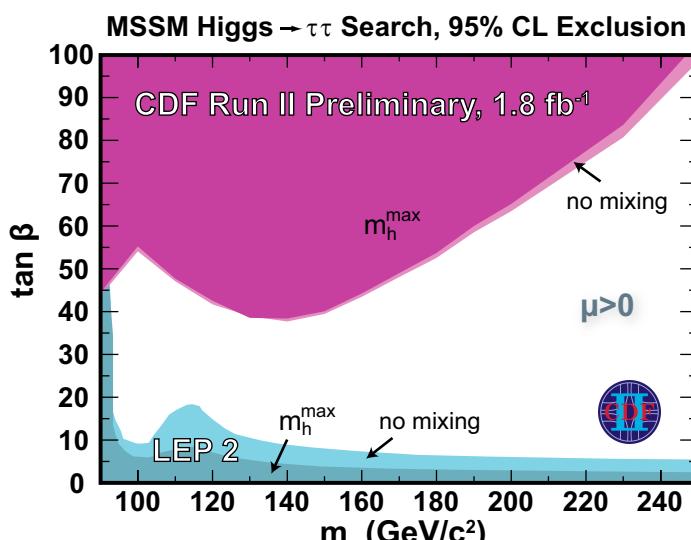

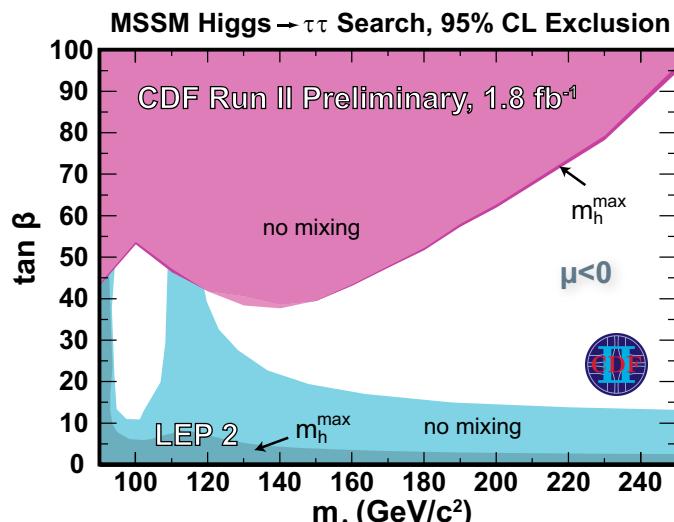

DØ and CDF Combination Inputs

- Model Independent Limits
 - $\sigma \times \text{BR}(\phi \rightarrow \tau\tau)$ at 95% CL level

DØ and CDF Combination Inputs

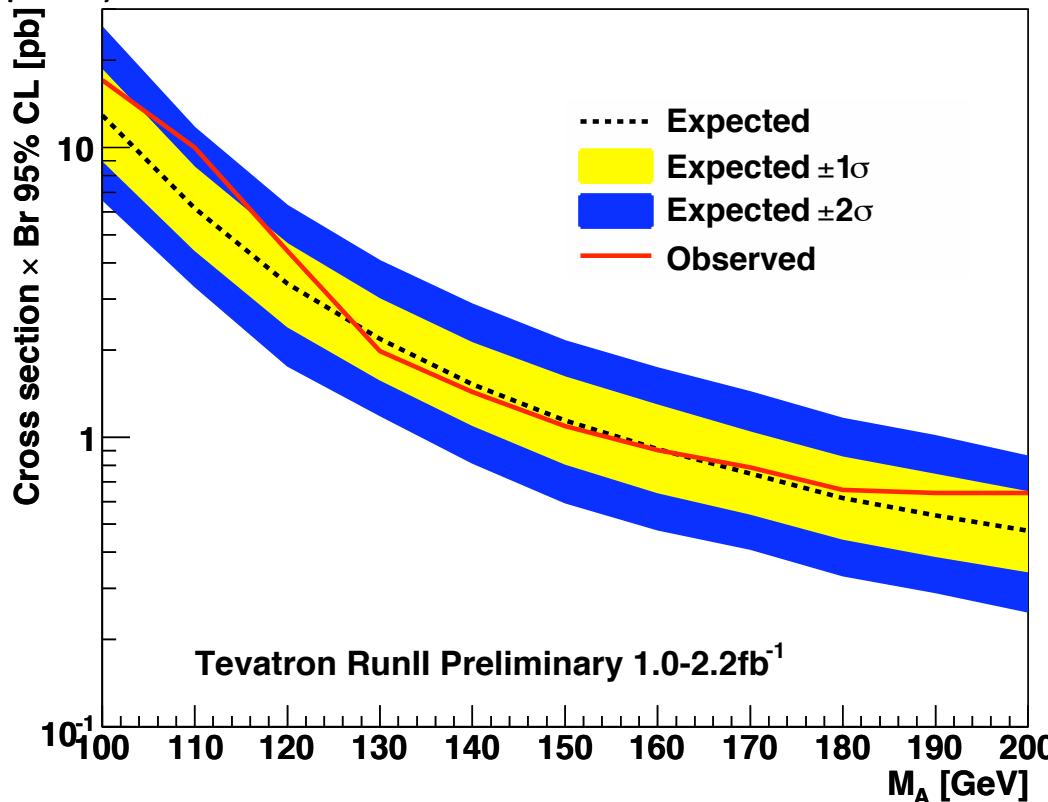

MSSM
exclusions
in M_A , $\tan \beta$
plane

DØ and CDF Combination Limits

- Model Independent Limits

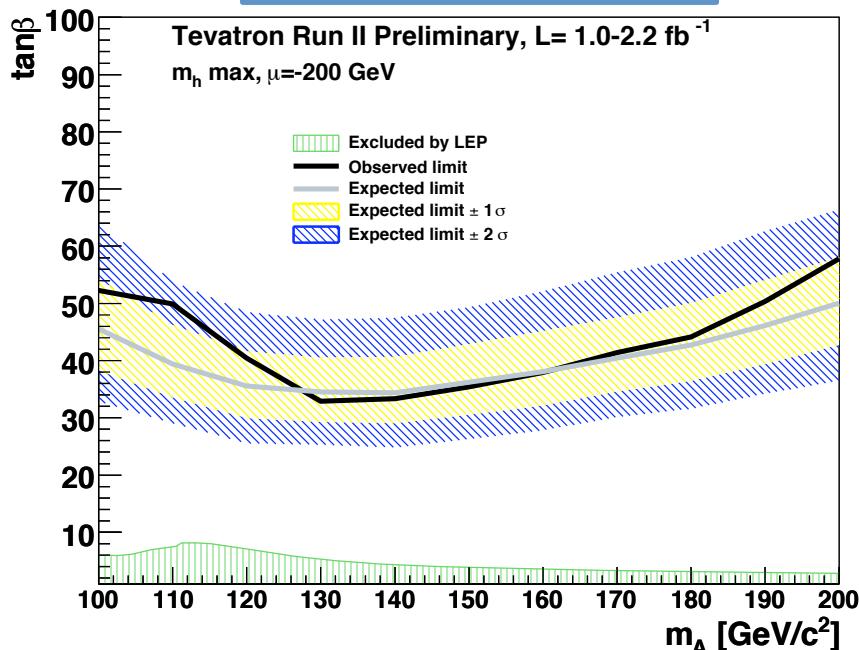

- $\sigma \times \text{BR}(\phi \rightarrow \tau\tau)$ at 95% CL level

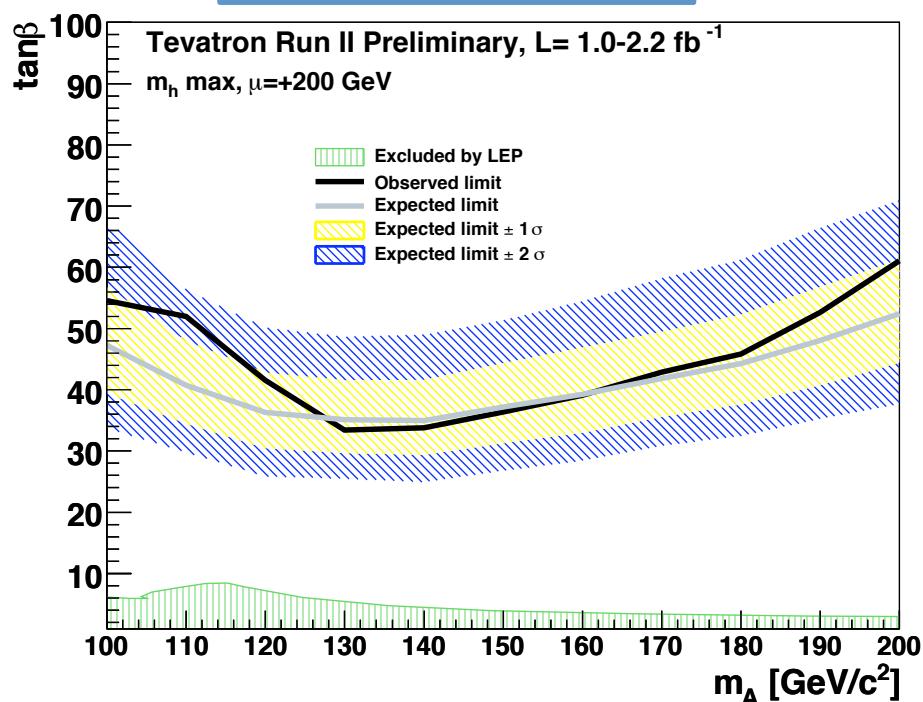

Limits in good agreement with expected, no significant excess seen.
Correlation of systematics between experiments taken into account.

DØ and CDF Combination Limits

$m_h \text{ max}$

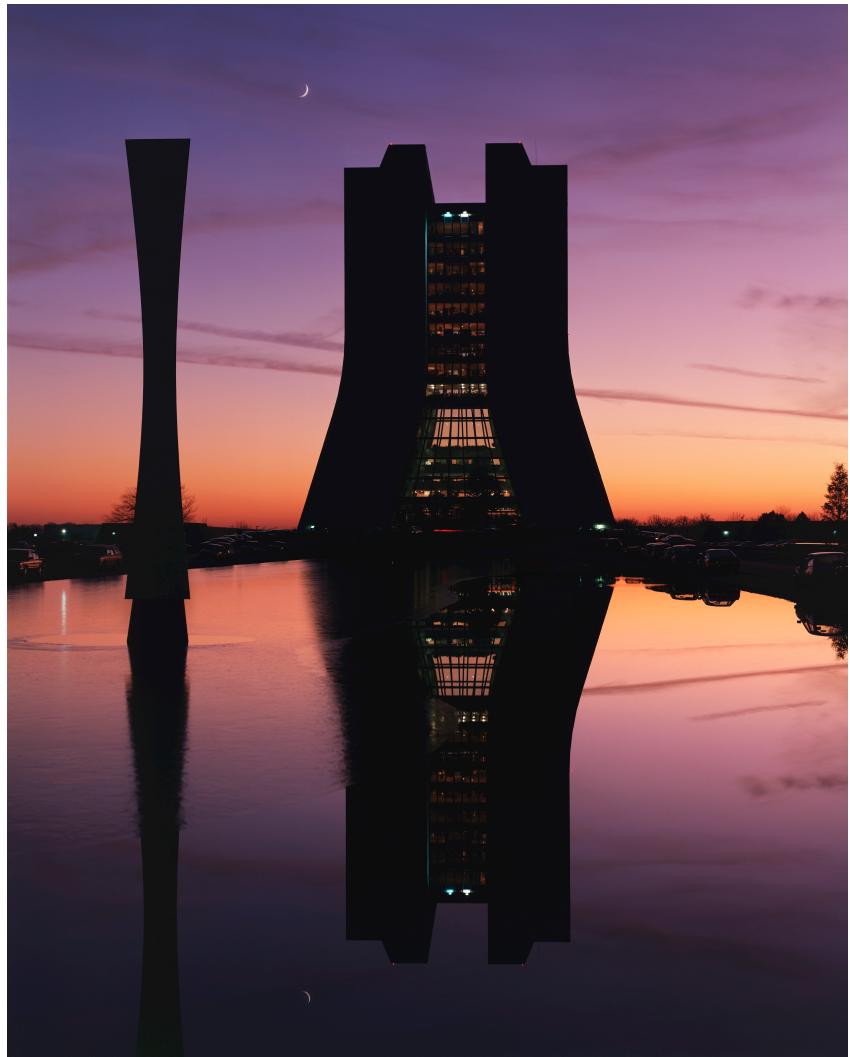

no mixing

Tan β width effects not expected to have large effect in this region

New combination out soon!

DØ Combination

Limits set on production cross section of Higgs boson in association with one or more b quark

Combine two channels:

$b\phi \rightarrow bbb$: 5.4 fb^{-1} integrated luminosity

$b\phi \rightarrow b\pi\pi$: 7.3 fb^{-1} integrated luminosity

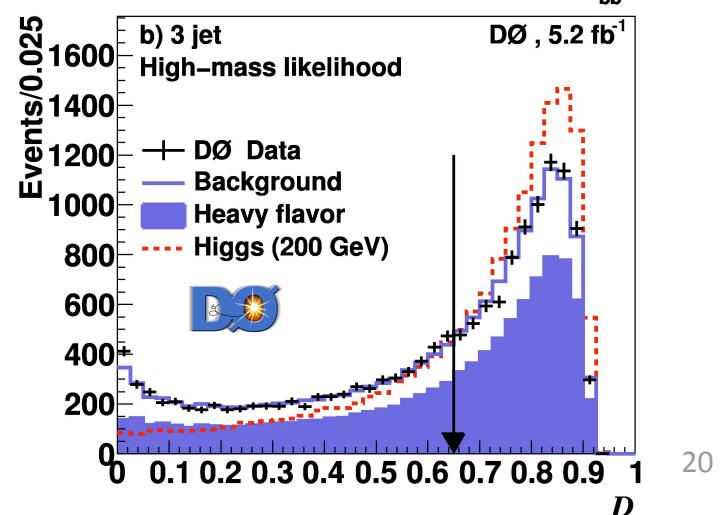

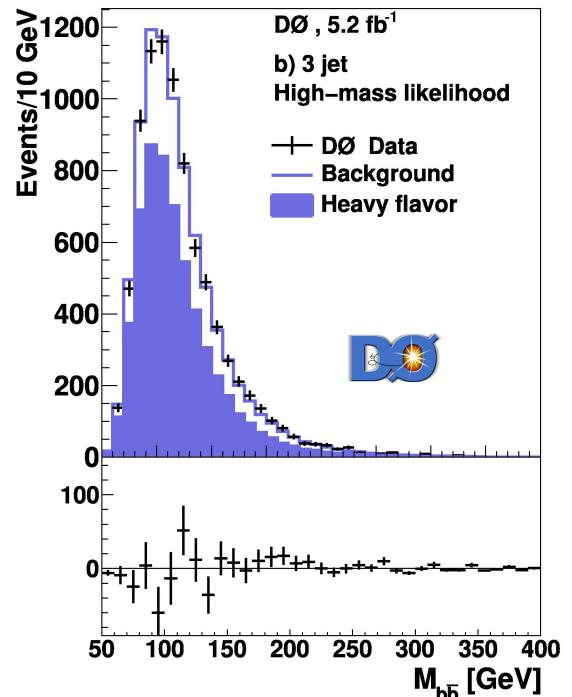

D \emptyset Combination Inputs

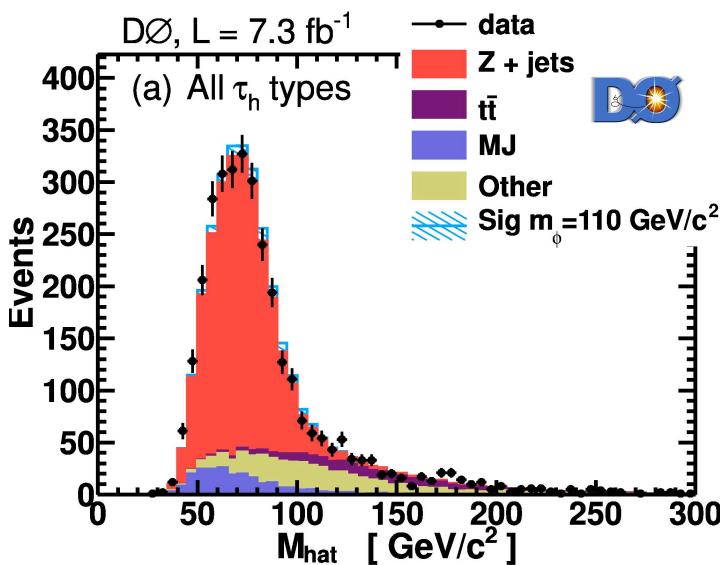

b $\phi \rightarrow bbb$

- Select 3 b-tagged jets
 - 3b jets greatly reduces background
- Background dominated multijet events
 - Predicted from data/MC
- Train discriminant to further separate signal
- Limits set using di-jet invariant mass

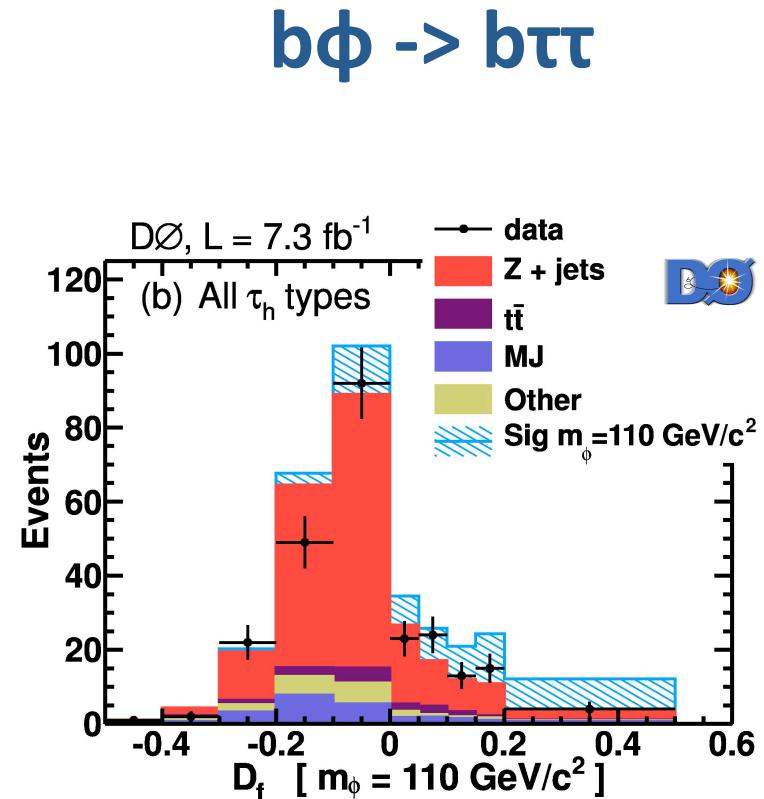

5.2 fb $^{-1}$ integrated luminosity

DØ Combination Inputs

- Assume one tau decays hadronically and one to a muon
- 7.3fb⁻¹ integrated luminosity
- Builds on previous 2.7fb⁻¹ result
 - Improved systematic uncertainties
 - Improved trigger approach
- Combines discriminants D_{MJ} , D_{tt} , $M_{\hat{h}}$, NN_{bb} into likelihood

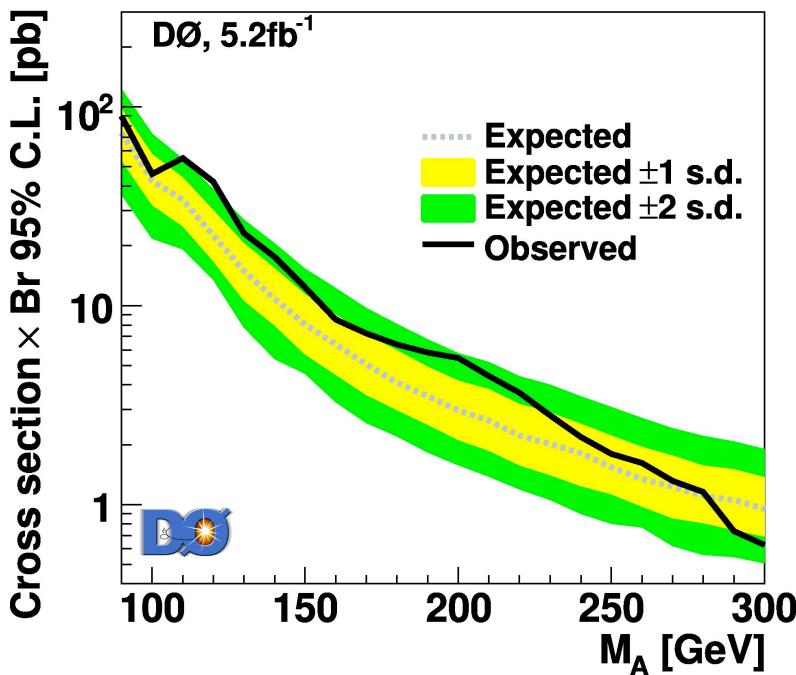

$$M_{\hat{h}} = \sqrt{(E^{\tau_\mu \tau_{had}} - p_z^{\tau_\mu \tau_{had}} + \not{P}_T)^2 + |\vec{p}_T^{\tau_{had}} + \vec{p}_T^{\tau_\mu} + \not{E}_T|^2}$$

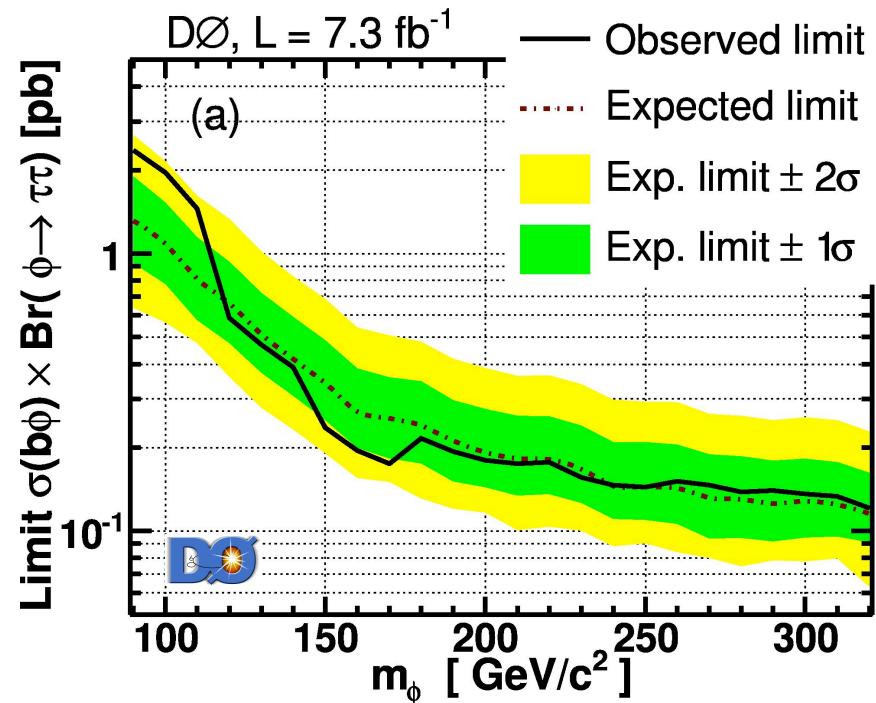

DØ Combination Inputs

- Model Independent Limits
 - $\sigma \times \text{BR}(\phi \rightarrow b\bar{b})$ or $\sigma \times \text{BR}(\phi \rightarrow \tau\bar{\tau})$ at 95% CL level

$b\phi \rightarrow b\bar{b}$

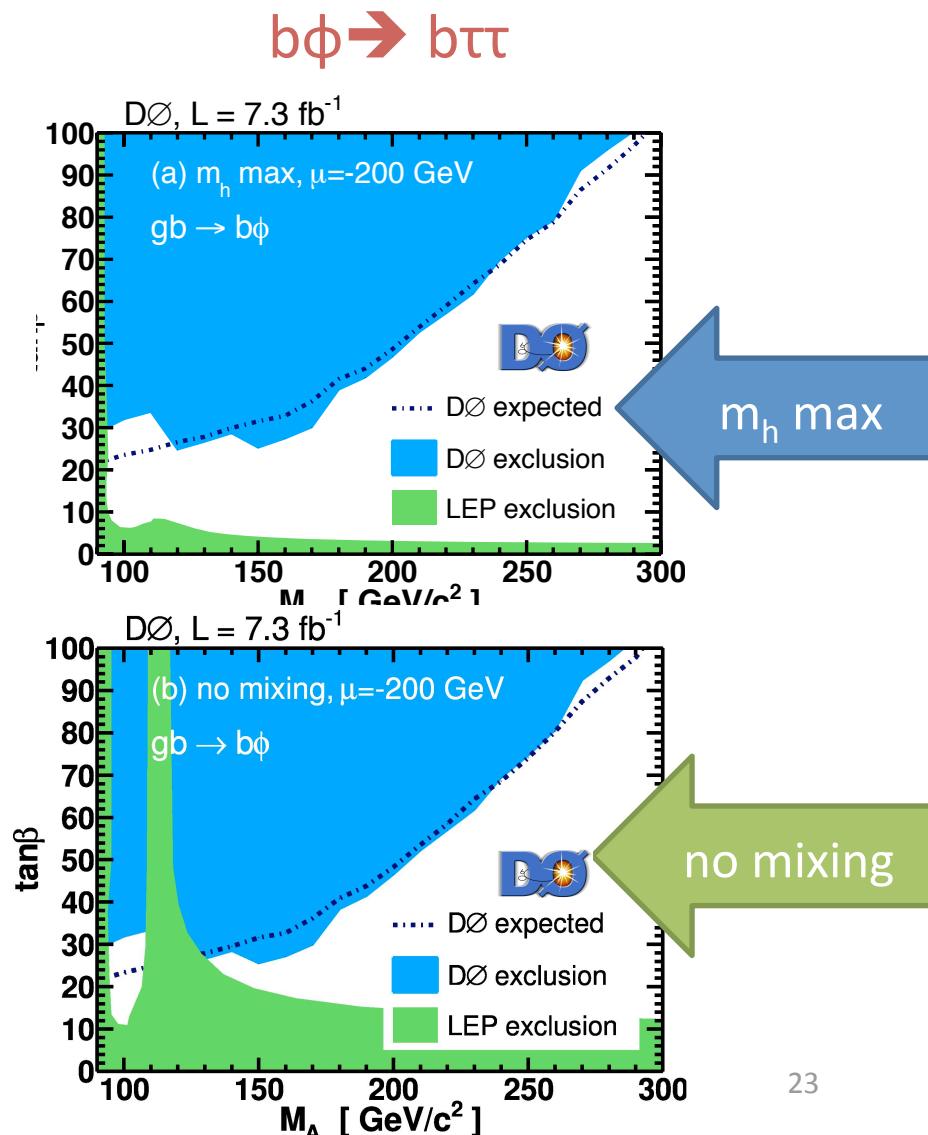

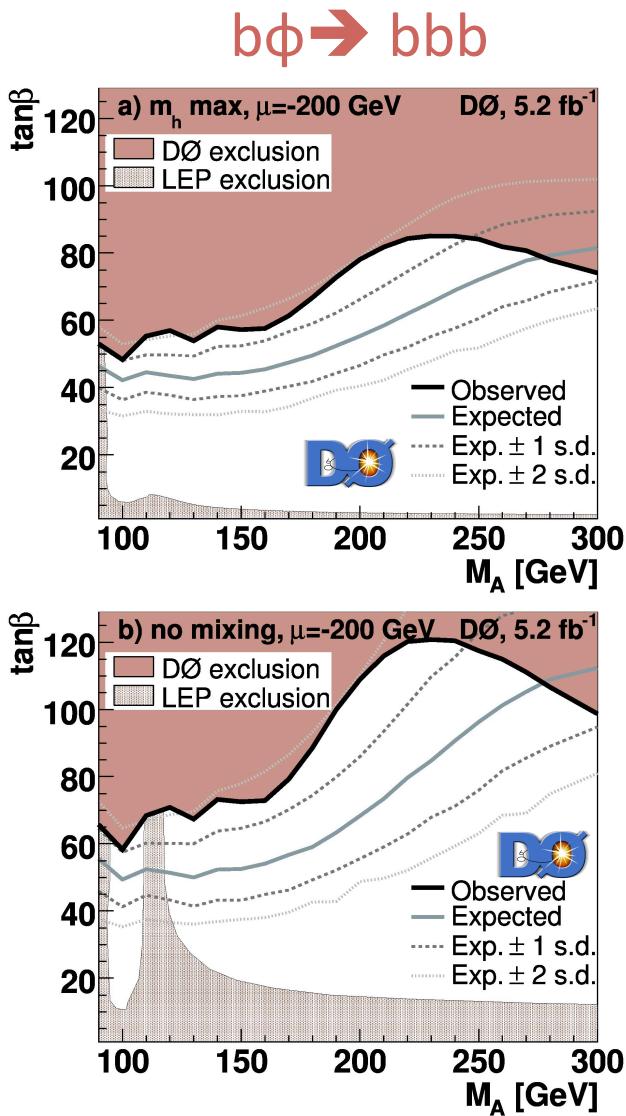

$b\phi \rightarrow b\tau\bar{\tau}$

2.5 s.d. significance excess at 120 GeV in $b\phi \rightarrow b\bar{b}$

DØ Combination Inputs

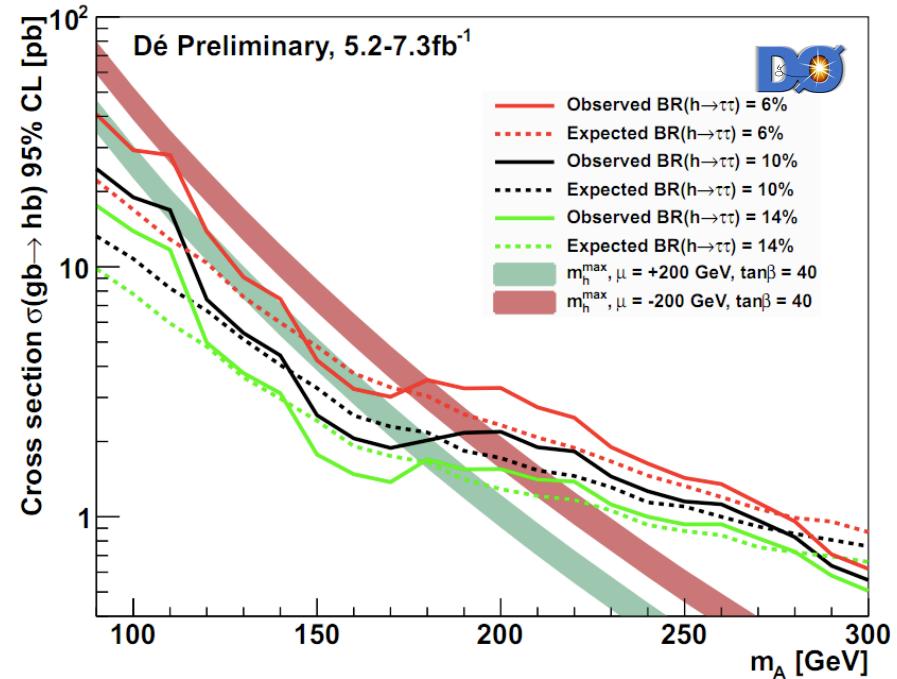

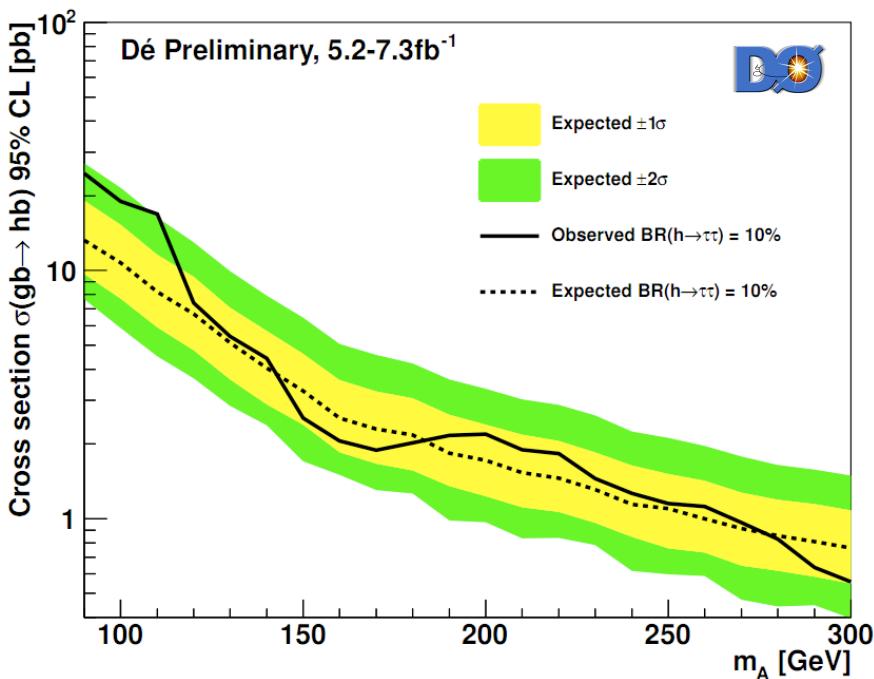

MSSM
exclusions
in M_A , $\tan \beta$
plane

DØ Combination Limits

Model Independent Limits

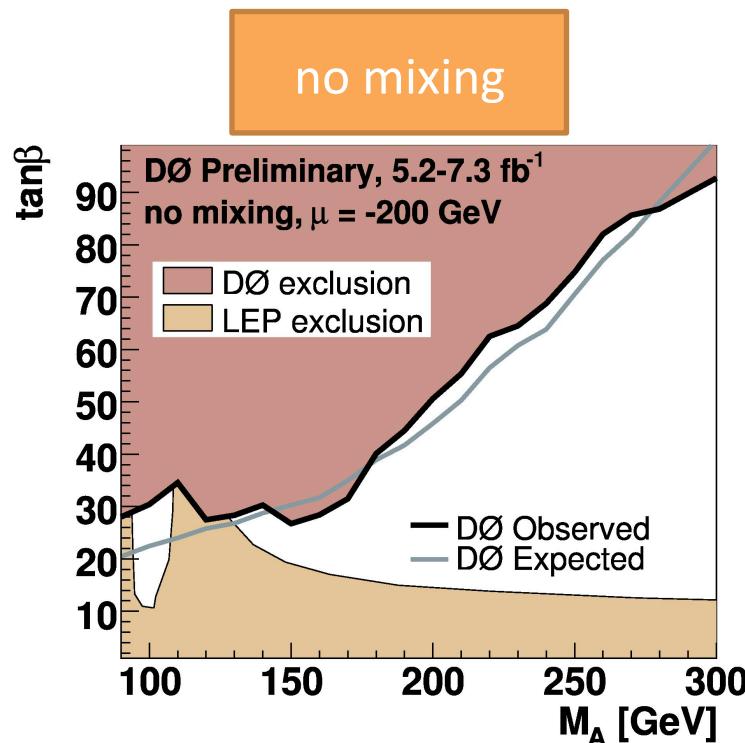

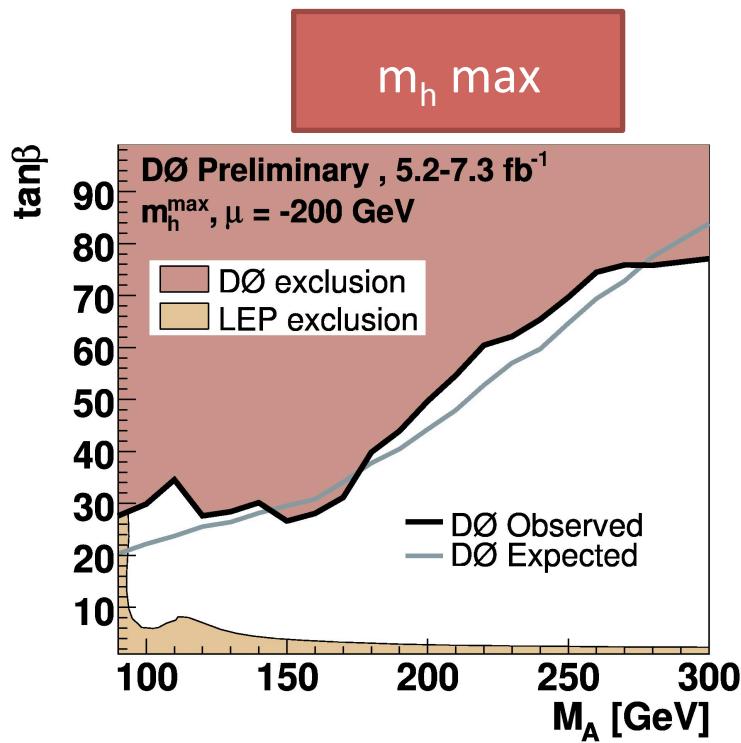

- Range 90 – 300 GeV
- $\text{BR}(\phi \rightarrow \tau\tau) + \text{BR}(\phi \rightarrow bb) = 1$
 - set for 3 values of $\text{BR}(\phi \rightarrow \tau\tau) = 6\%, 10\%, 14\%$

Best limits from the Tevatron on a SUSY Higgs

DØ Combination Limits

Interpreted in two MSSM scenarios

bbb channel remains the exclusive domain of Tevatron experiments

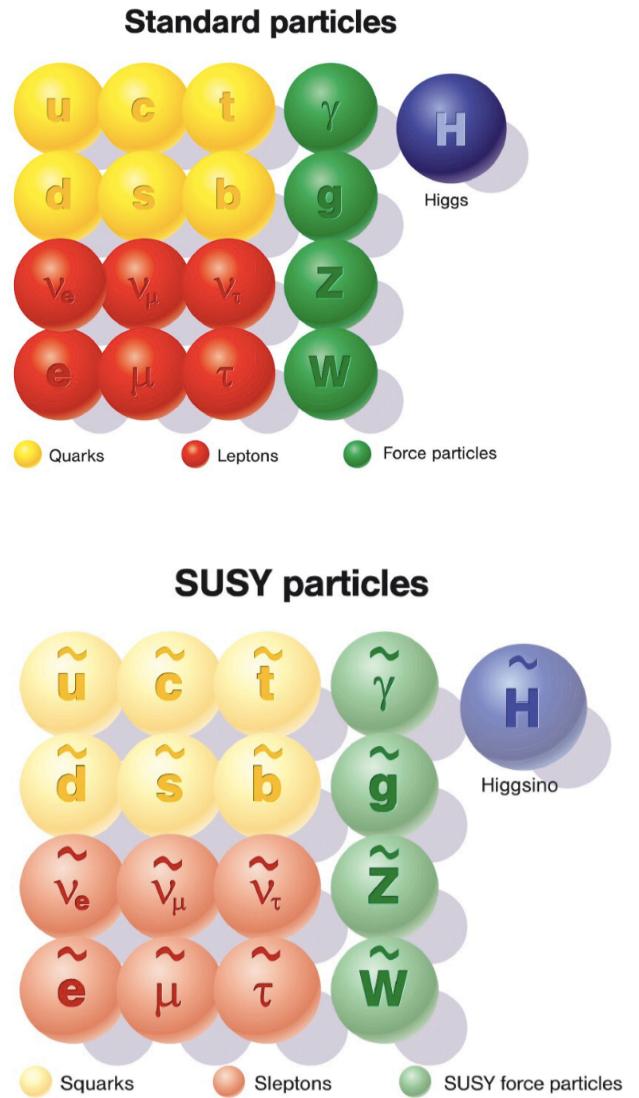

Conclusions

- Exciting new results out of the Tevatron
 - new results in
 - $\phi \rightarrow \pi\pi$
 - $b\phi \rightarrow bbb$
 - $b\phi \rightarrow b\tau\tau$
 - cover a wide range of channels using up to 7.3fb^{-1}
- DØ combination probing theoretically interesting regions.
- New DØ and CDF combination out soon!

Back Up

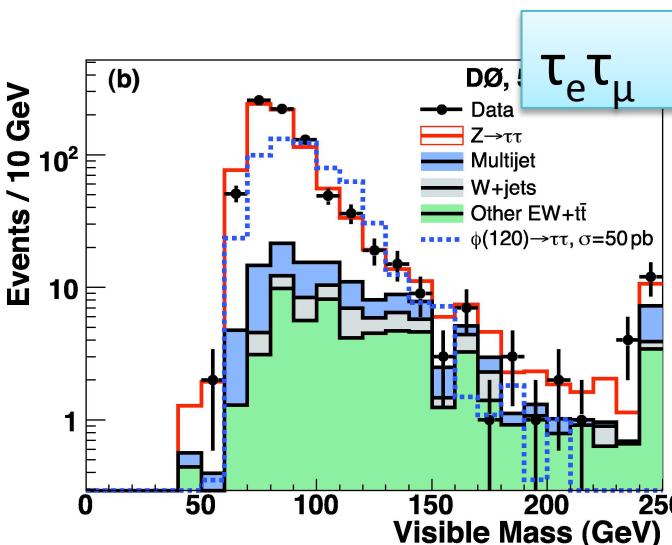

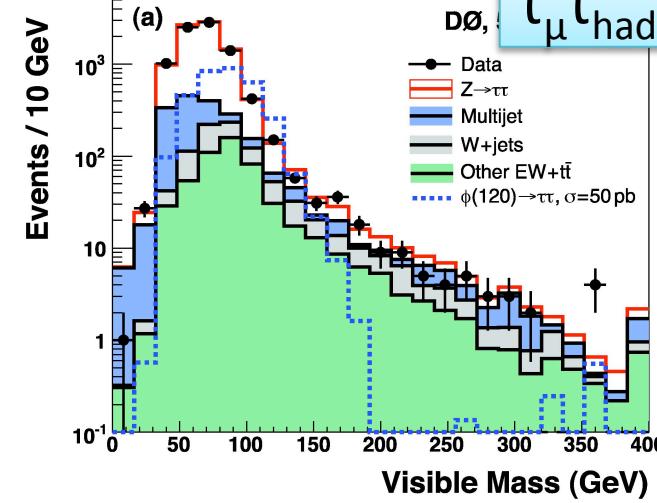

SUSY

- Introduce symmetry between bosons and fermions
 - Solution to hierarchy problem
 - Dark matter candidate
 - GUT scale unification
- Simplest form: MSSM
 - Two Higgs doublets: H_u, H_d
 - After EW symmetry breaking:
5 Higgs Bosons h, H, A, H^\pm

$\phi \rightarrow \tau\tau$

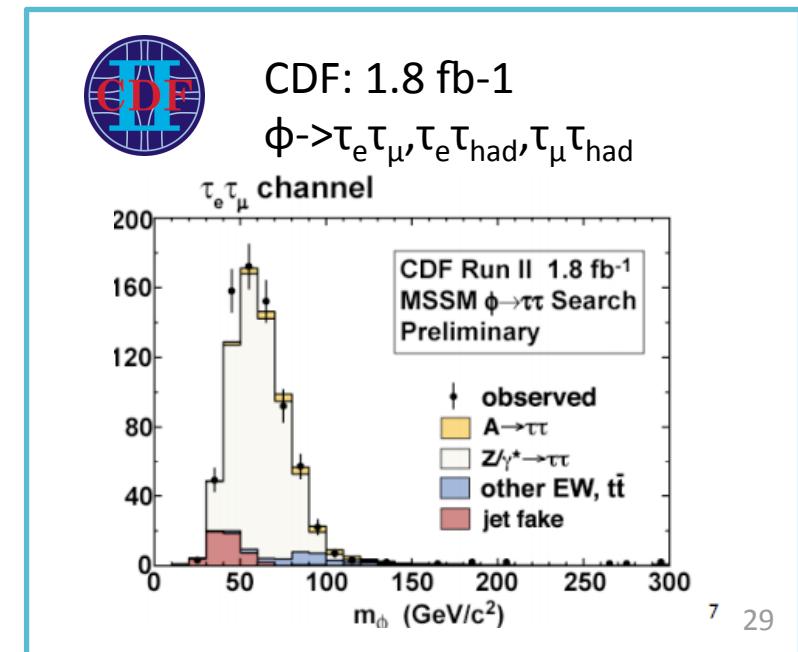

New Result!

- Select two high P_T isolated leptons of opposite sign
- look for excess in

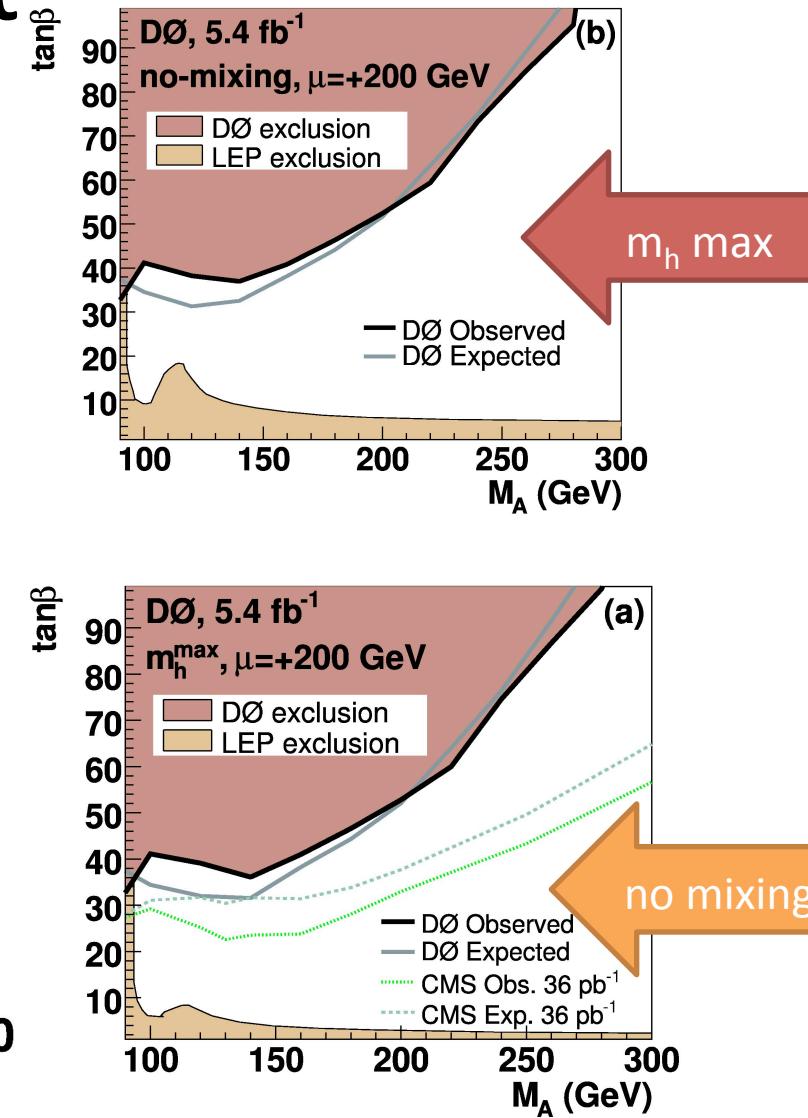

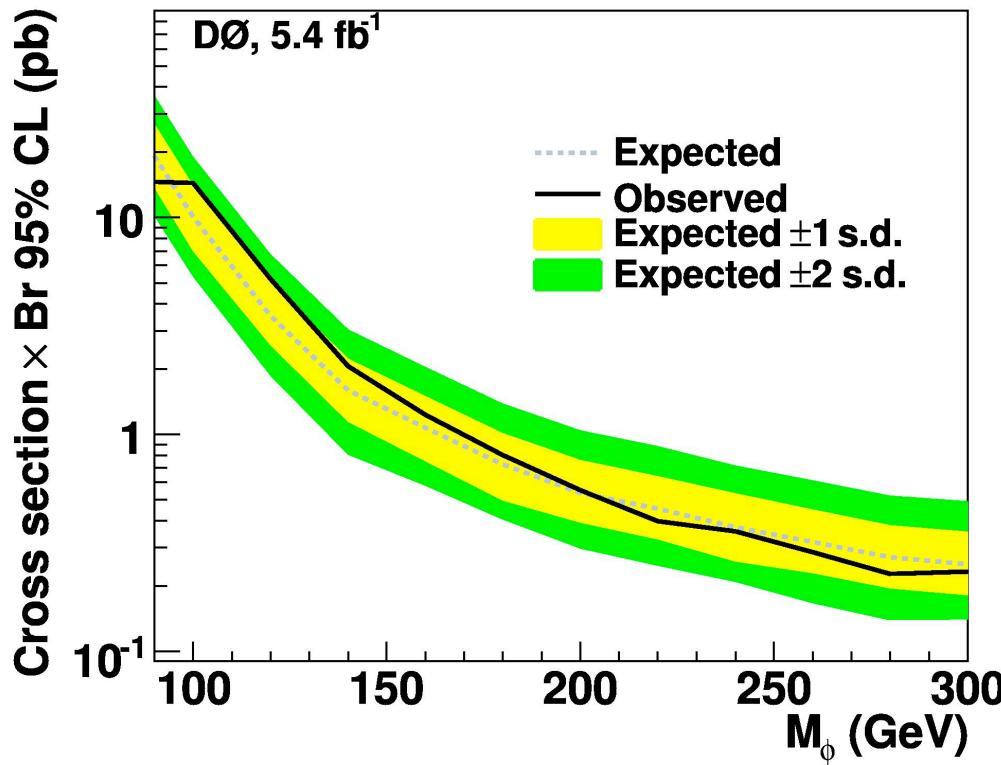

$$M_{vis} = \sqrt{(p_{\tau_h} + p_\mu + P_T)^2}$$

5.4 fb^{-1} integrated luminosity

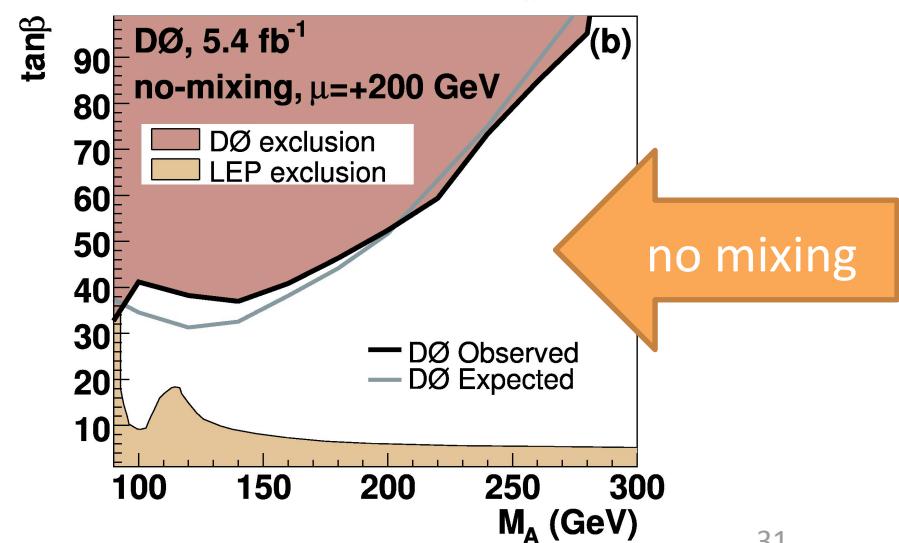

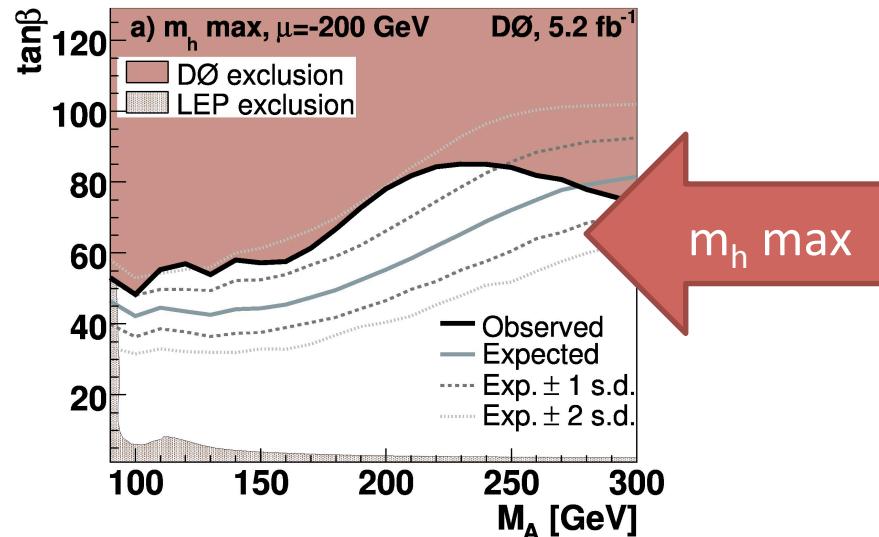

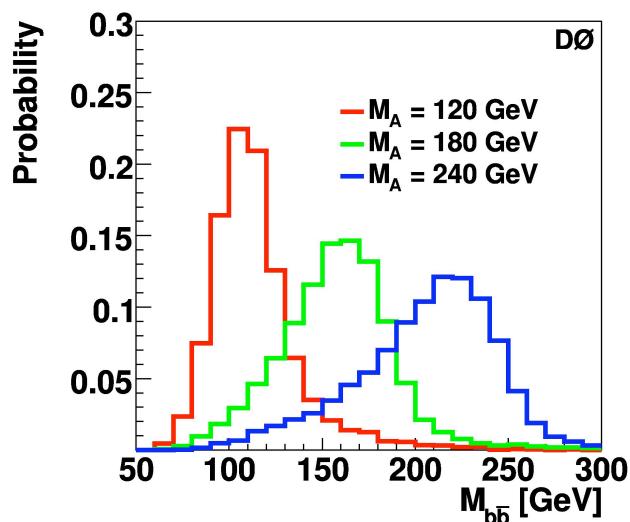

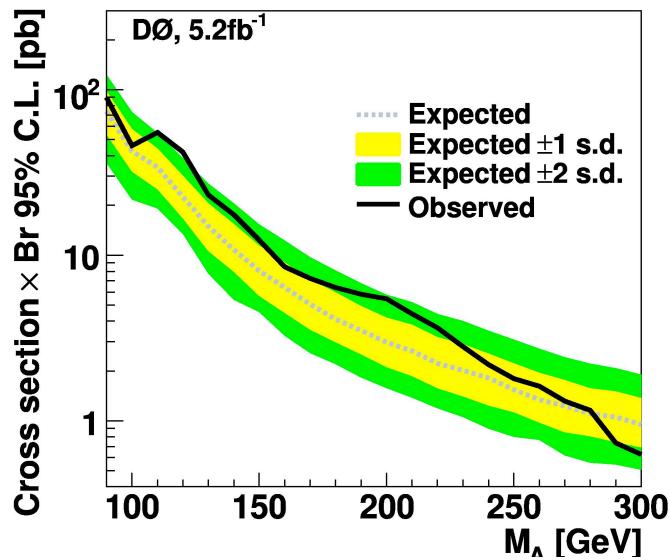

$\phi \rightarrow \tau\tau$

- Model Independent Limits
 - $\sigma \times \text{BR}(\phi \rightarrow \tau\tau)$ at 95% CL level
 - $M_a = 90 - 300 \text{ GeV}$

$bh \rightarrow bbb$

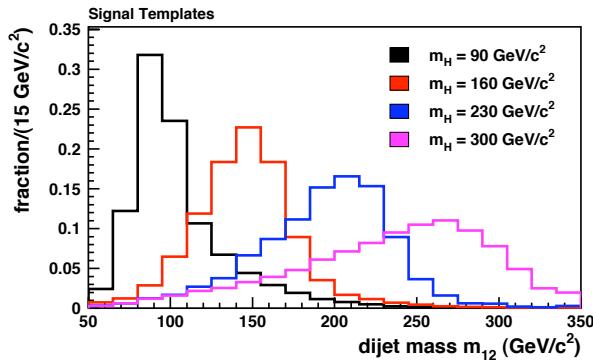

$b\phi \rightarrow bbb$

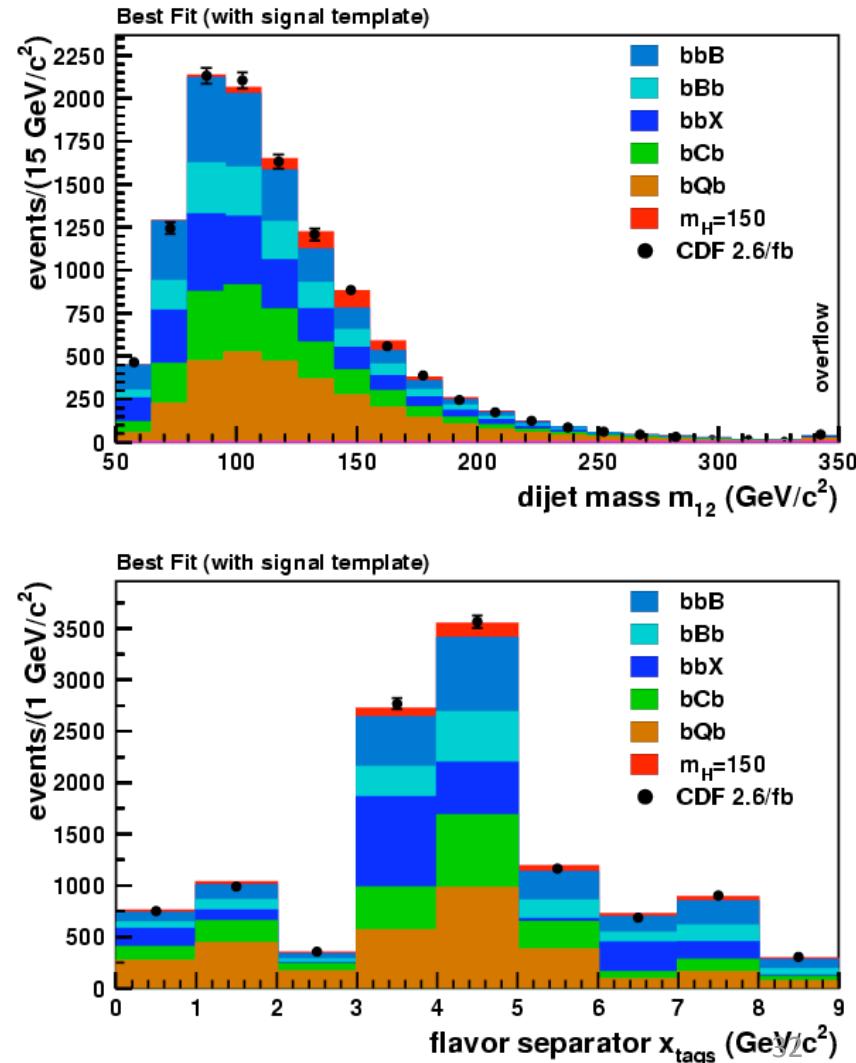

New Result!

- Look in di-jet mass spectrum
- Select events 3 or more b-tagged jets

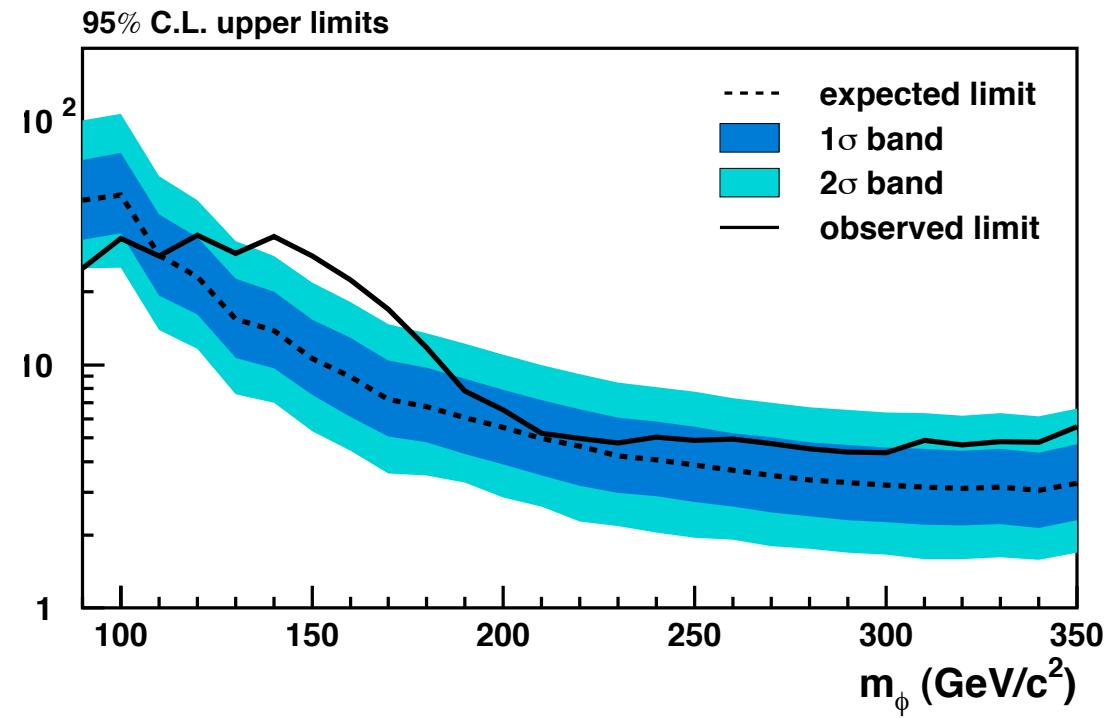

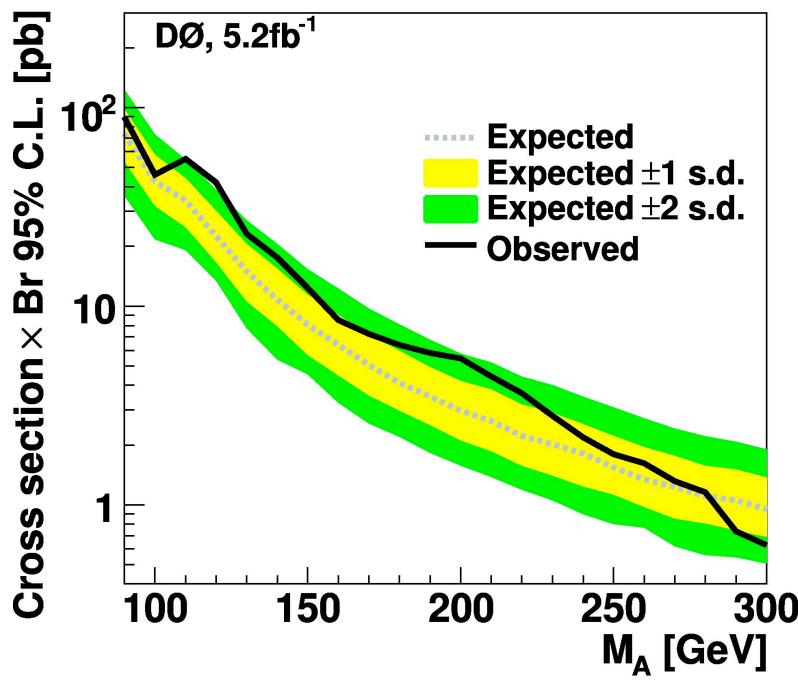

- background modeled data driven tech in double tagged events
- separate background and signal using 2D fit

2.6 fb^{-1} integrated luminosity

$b\phi \rightarrow bbb$

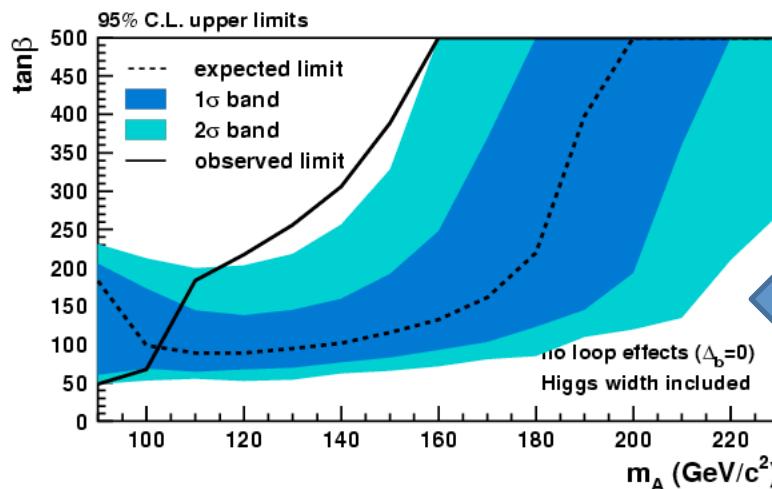

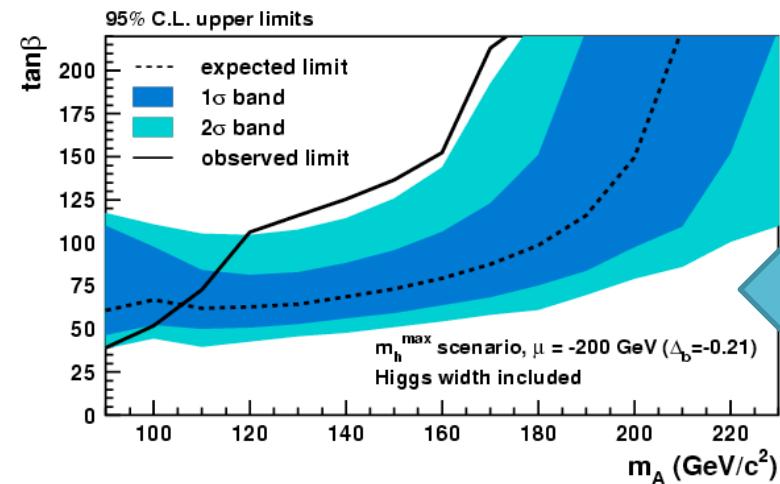

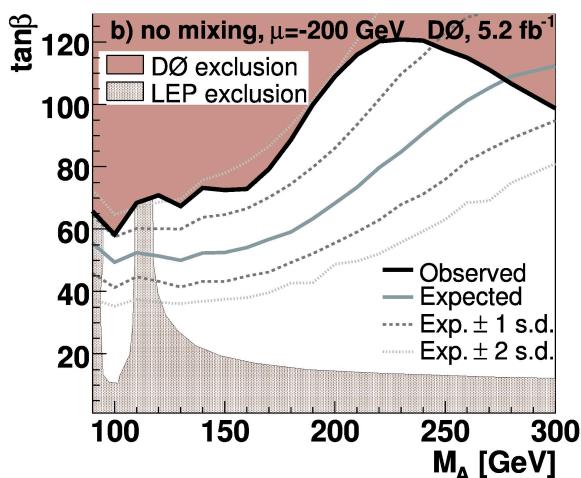

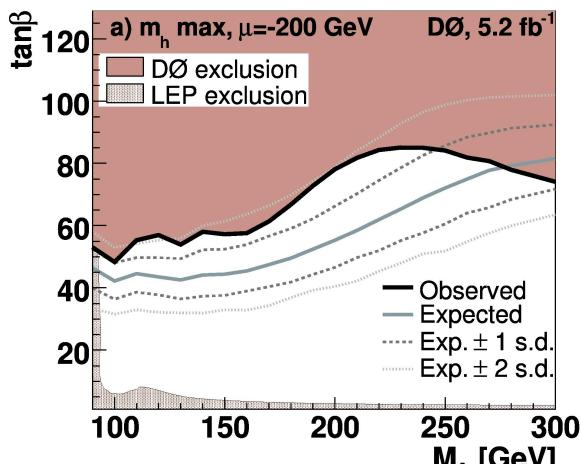

- Model Independent Limits
 - $\sigma \times \text{BR}(\phi \rightarrow bb)$ at 95% CL level
 - $M_a = 90 - 300 \text{ GeV}$

DØ: 2.5 s.d. significance excess at 120 GeV
 CDF: > 2 sigma discrepancy 130-150 GeV

$b\phi \rightarrow bbb$

MSSM exclusions in M_A , $\tan\beta$ plane

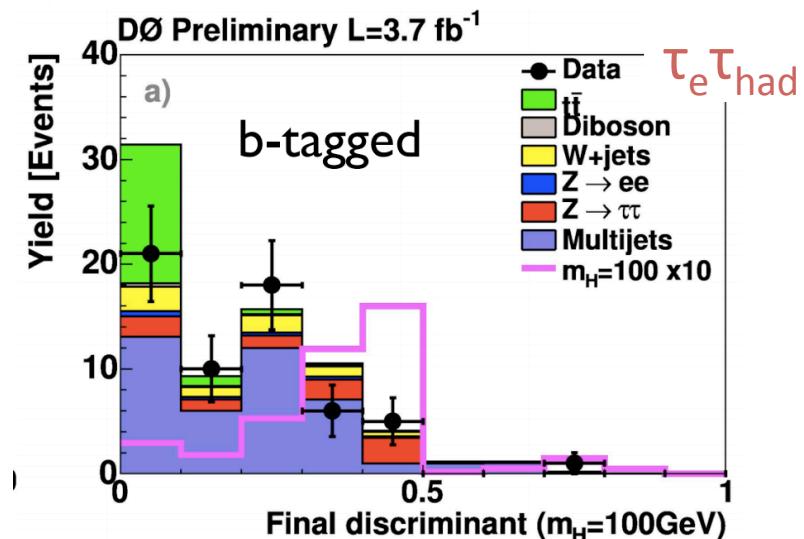

b ϕ \rightarrow b $\tau\tau$

New Result!

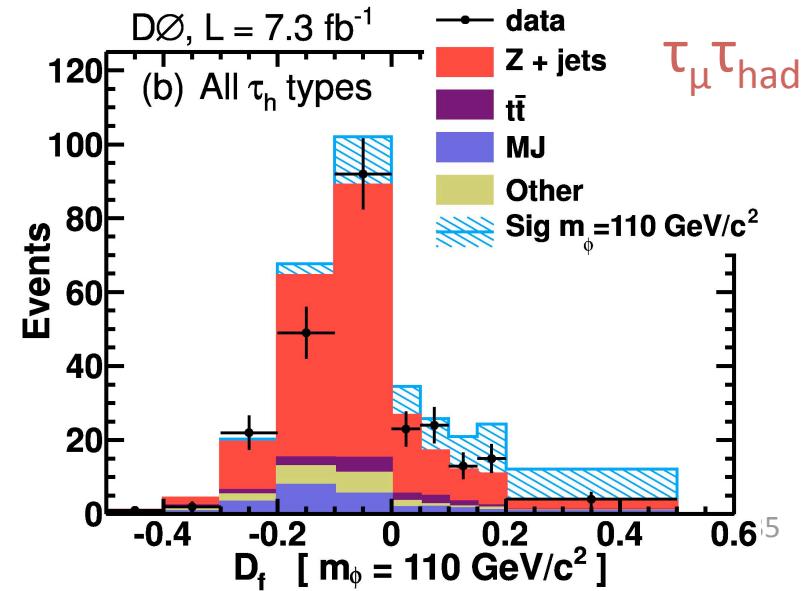

$$\text{BR}(\phi \rightarrow \tau\tau) \sim 10\%$$

- h- $\rightarrow \tau_e \tau_{\text{had}}$: 3.7 fb $^{-1}$ integrated luminosity
 - Specific discriminants for main backgrounds D_{MJ}, D_{tt}

Even Newer Result!

- h- $\rightarrow \tau_\mu \tau_{\text{had}}$: 7.3 fb $^{-1}$ integrated luminosity
 - Improved systematic uncertainties
 - Improved trigger approach
 - Combined D_{MJ}, D_{tt}, M_{hat}, N_{bb} into likelihood

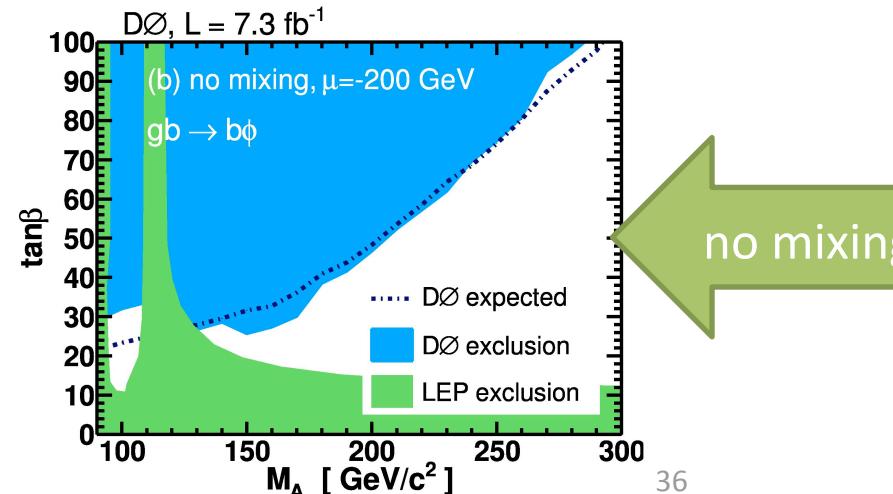

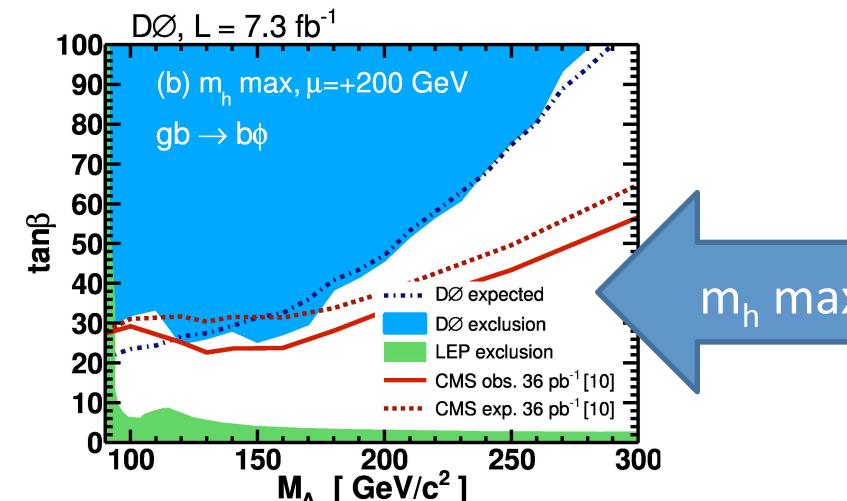

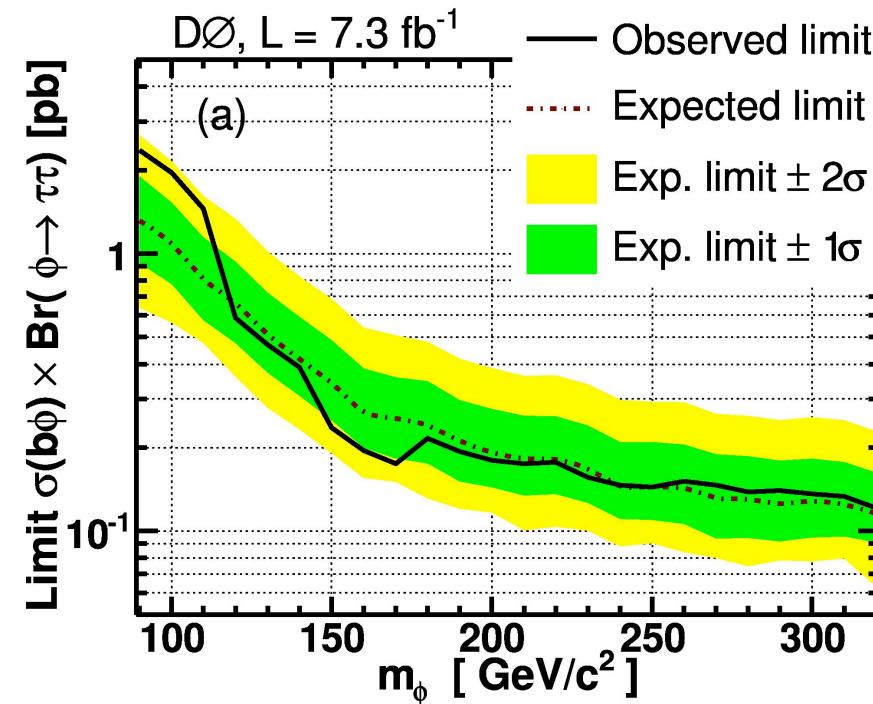

b ϕ → b $\tau\tau$

New Result!

- Model Independant Limits
 - $\sigma \times \text{BR}(\phi \rightarrow \tau\tau)$ at 95% CL level
 - $M_a = 90 - 300 \text{ GeV}$

DØ and CDF Combination Systematics

Dominant effects

- DØ – object Id, Trigger, luminosity, signal acceptance
- CDF – object Id, luminosity, signal acceptance
- Correlated systematics
 - luminosity, $t\bar{t}$ and diboson production cross sections
- Uncorrelated systematics
 - multijet determination
 - calibration of fake rate, unvetoed $\rightarrow ee$ conversions, b-tagging efficiency, mistag rates.
