A. Blondelle

Demonstrator of the metal-insulated REBCO high field magnet coils

CEA-CERN HFM collaboration agreement on HTS developments (KE5647)

Thibault Lécresse (CEA)

Amalia Ballarino (CERN)

+ Technical support and DACM experts

Overview

1. Program roadmap

Development main phases

Why Metal Insulated (MI) windings ?

Detail on Phase 1 program (2023-2025)

2. Activities Overview

Modelling

Characterization

Winding

Coil model conception

1. Program roadmap

1. Program roadmap: Development main phases

Phase 3 :
MI
16 T+ dipole
magnet

Phase 2 :
MI 16 T+ dipole field
« EuCARD1 V2 »

Phase 1 2023-2025:
Racetrack MI

KE5647

Start: 01/04/2023

End: 31/03/2025

1. Program roadmap : Why Metal Insulated (MI) windings ?

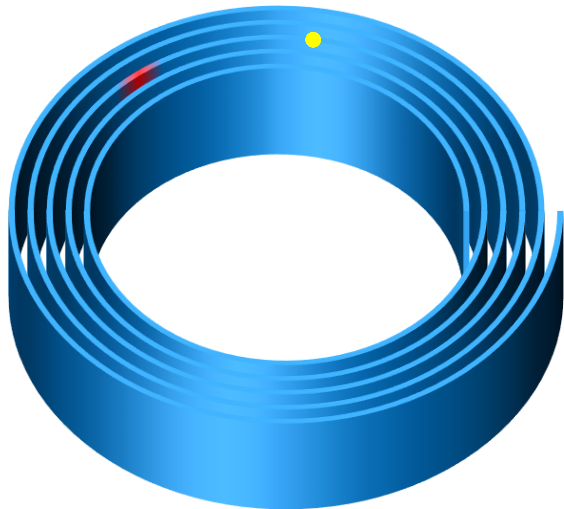

What is MI winding ? Why to use it for those magnets ?

Insulated HTS coil

Quench : ↗ local temperature

- Thermal risk during quench
- Design limits evaluation
- High current density
- Higher mechanics

NI or MI

Quench : ↗ local temperature limited

- Radial currents effects ?
- Working for bigger coils ?
- High stored Energy ?
- What suitable R_{ct} value ?

MI NOUGAT insert

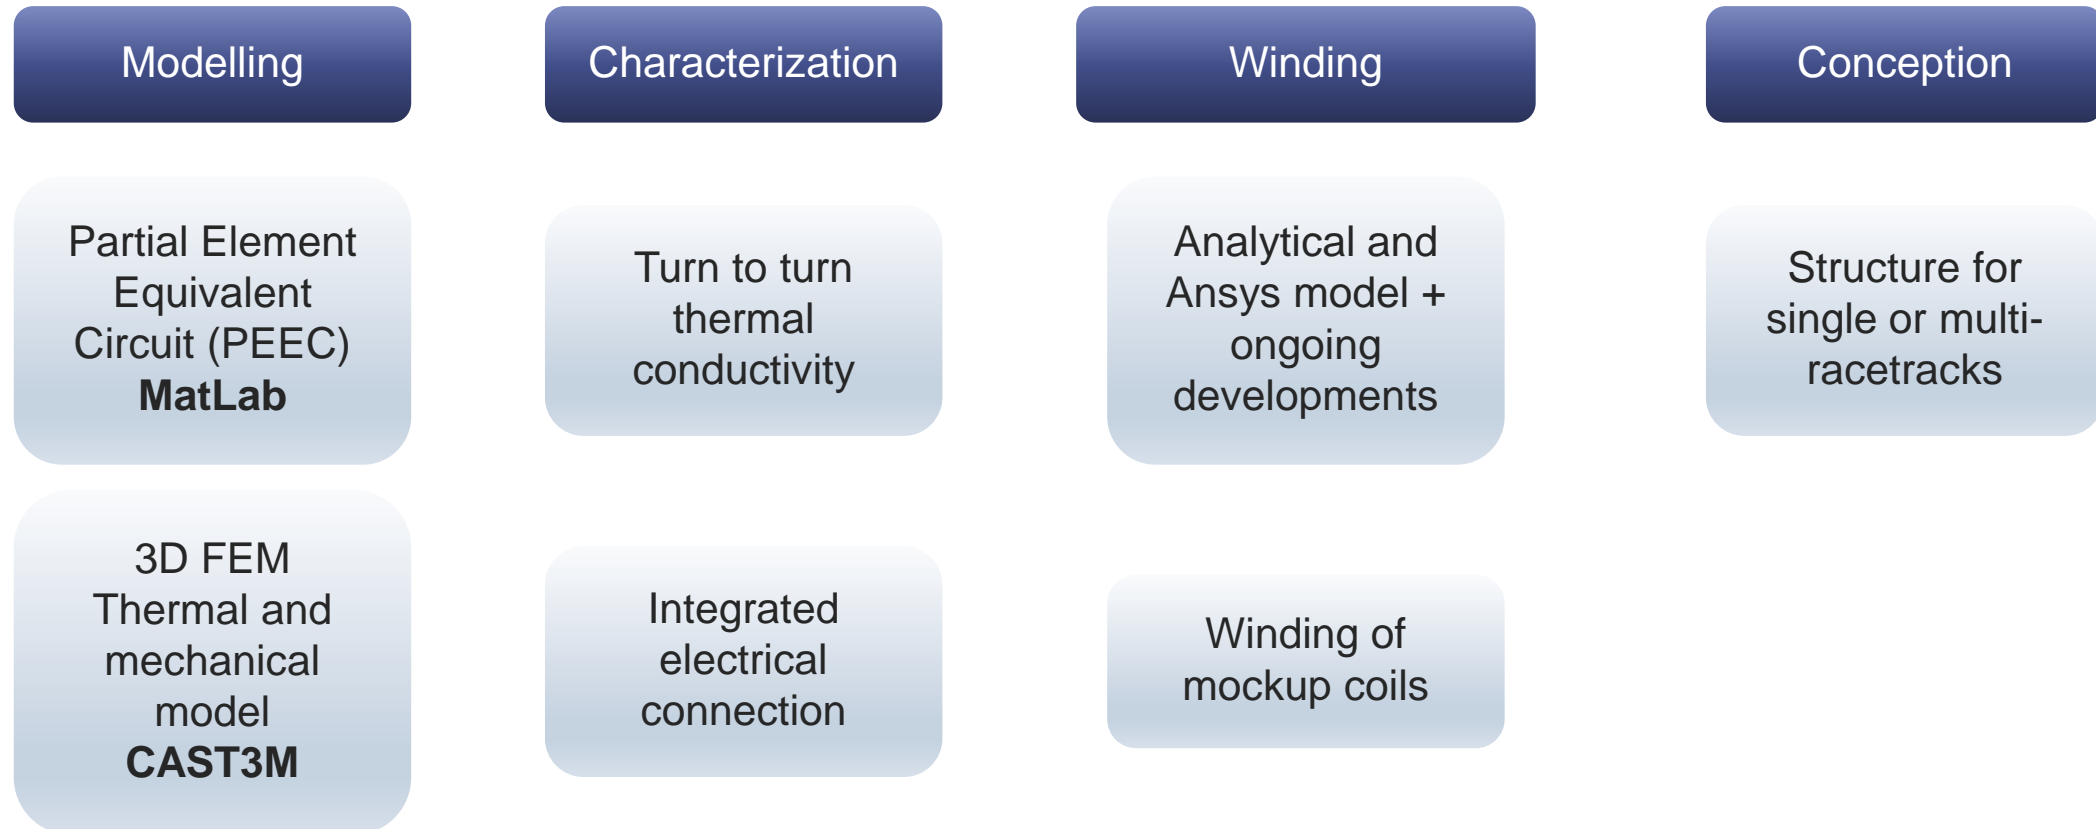

- Quench at 32.5 T (18 + 14.5)
- Still working
- Good training magnet
- Feedback on key issues

1. Program roadmap : Detail on Phase 1 program (2 years, 2023-2025)

How to answer to the questions ?

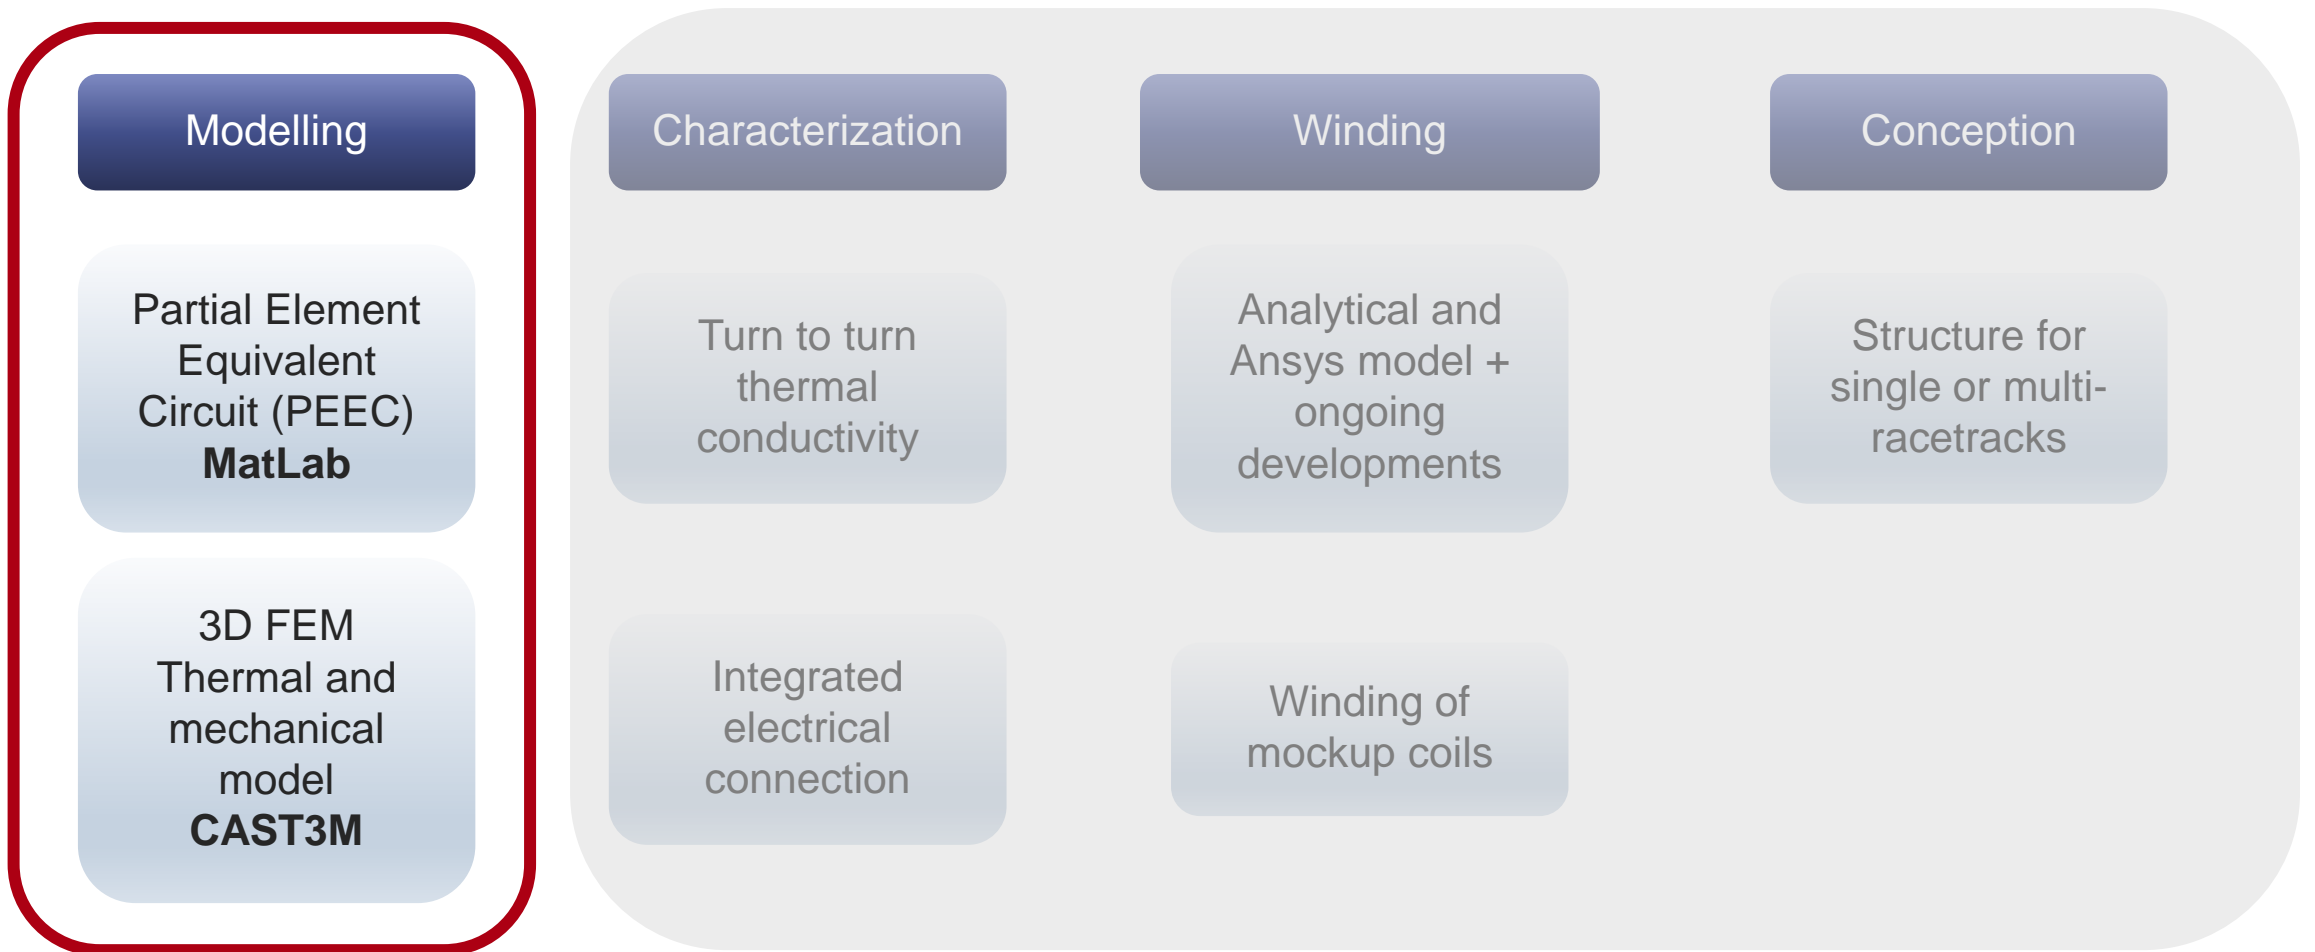

4 axes

2 ■ Activities Overview

2. Activities overview

2. Activities overview : Partial Element Equivalent Circuit model

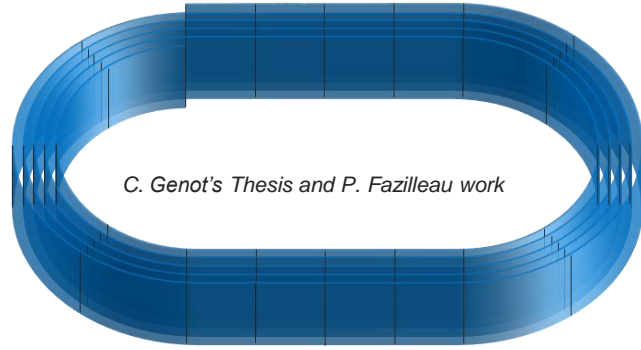

A. Blondelle

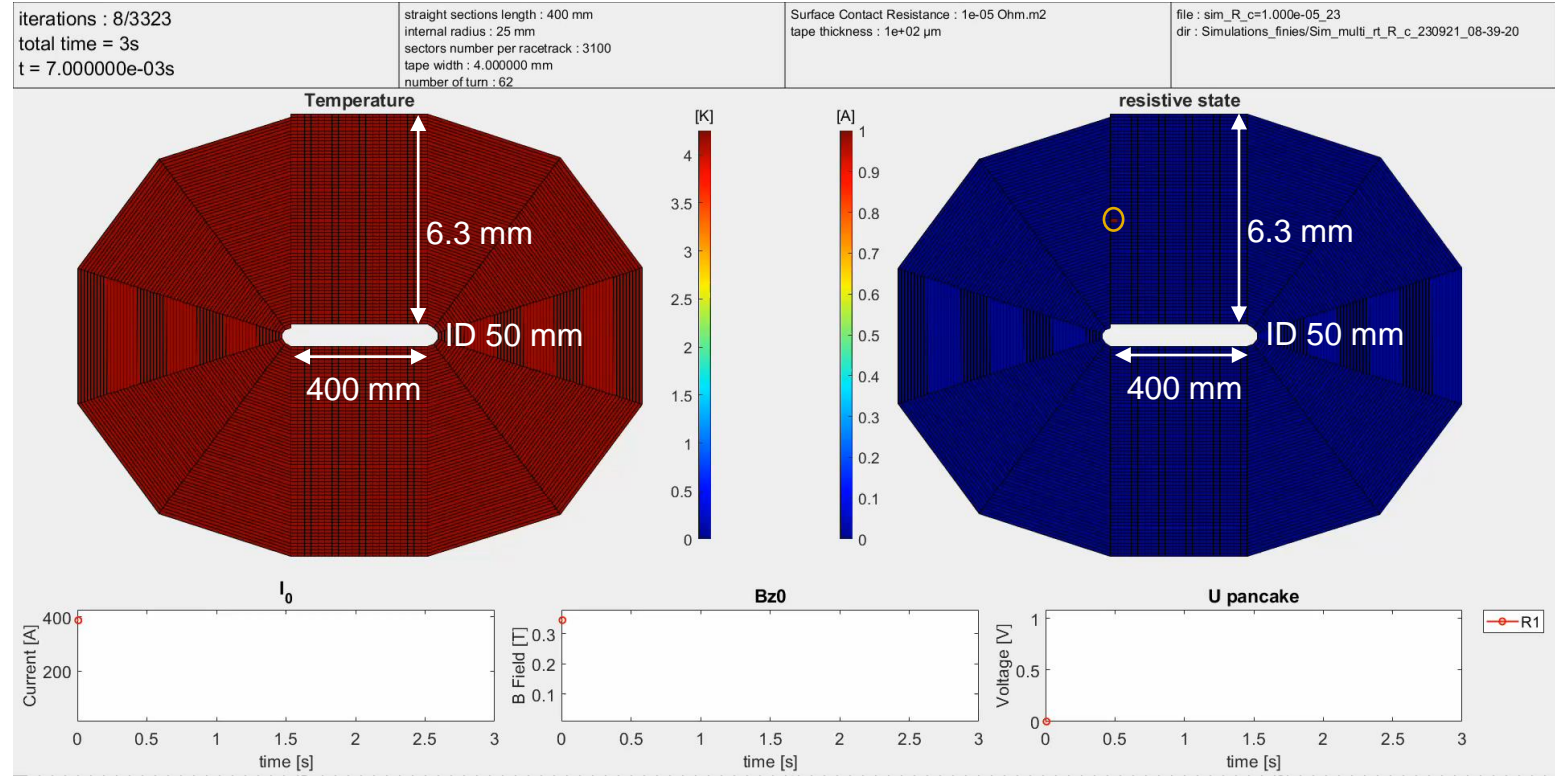

C. Genot

P. Fazilleau

C. Genot's Thesis and P. Fazilleau work

62 turns / 60 m of tape / ID = 50 mm / $L_d = 400$ mm

3D electromagnetic
2D finite difference thermal

Implemented in MatLab

[MT 28 Poster](#)

2. Activities overview : Partial Element Equivalent Circuit model

A. Blondelle

C. Genot

P. Fazilleau

Racetrack model

Optimization

Features

Cases implementation

Benchmark / validation

Integration in multi-physics model

Code simplification

Parametrization
Geometrical (size / sectors)
Material (elect. And Thermal properties)

Over current

Single Racetrack Parametrical study

Coupling with 3D thermal and mechanical models (see dedicated part)

Model Homogenization

Ramp up or down

Multi Racetrack Parametrical study

Model Simplification

Quench by Local heat deposition

Choice racetrack geometries and cases/signal

Time dependent heat sources / current distribution extraction

GPU / FMM

Multi-racetracks model

Quench by Local degradation

Magnetization / AC losses (feasibility under evaluation)

Voltage limitation

Done

Ongoing

Not started

2. Activities overview

2. Activities overview : Turn to turn thermal conductivity

- Turn to turn thermal conductivity study → to be tested inside Mectix(*) facility

All part of the system have been **received**

Bolts are being **calibrated**, **pressure homogeneity** on the stack need to be evaluate before the first measurement

E. Benoist

B. Maloeuvre

S. Somson

Simulated compressive stress on the stack

[MT28 poster](#)

(*) isoperibolic cell developed for Nb3Sn stack conductivity measurements

2. Activities overview : Integrated electrical connection

➤ Integrated electrical connections

HTS strips

Avoid such leads out

Integrated electrical connection

Rings tests on NI and MI

Connections material and design

- Rings / Blocs
- Manufacturing process
- Composition and surface

Test plan

- Parameters and aimed values for the final object (pressures, temperature, current, cycles, etc.)
- Samples definition

Test apparatus & station

- Setup design
- Integration in existing test stations
- Interfaces number & modularity
- Instrumentation

Hall Building 392

Control bay

- Coil up to 1 m in diameter, 500 mm in high
- Up to 6 co-wound tapes (later 10)
- Tension up to 230 N per tape (individually controlled)
- All winding parameters recorded for analysis

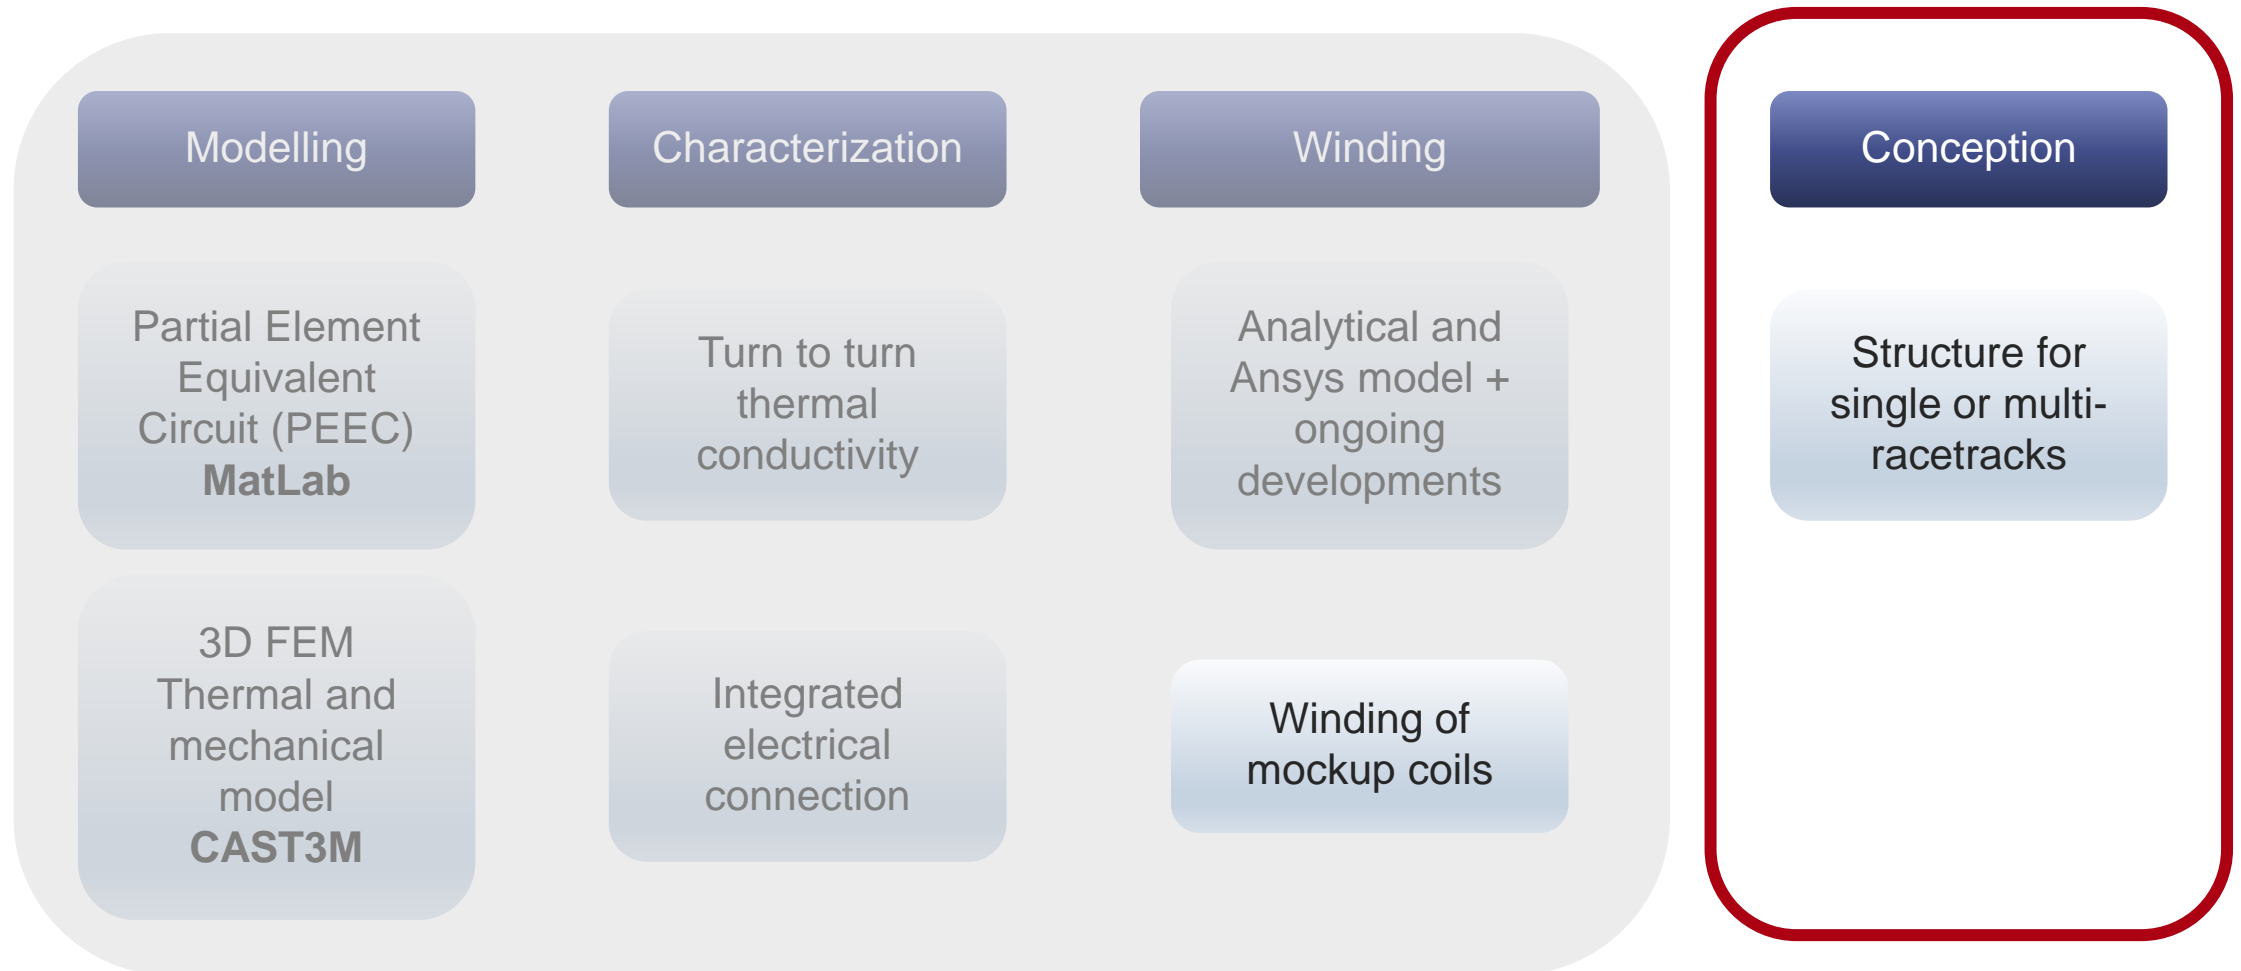

Winding part

Tape spools
tension
management

2. Activities overview

2. Activities overview : Coil model conception

➤ Ongoing pre-design of racetrack mechanical structure

- For one or multi pancakes
- Include current leads
- Include conduction cooling

...
