Chiral Belle: e^- Beam Polarization Upgrade for SuperKEKB

J. Michael Roney

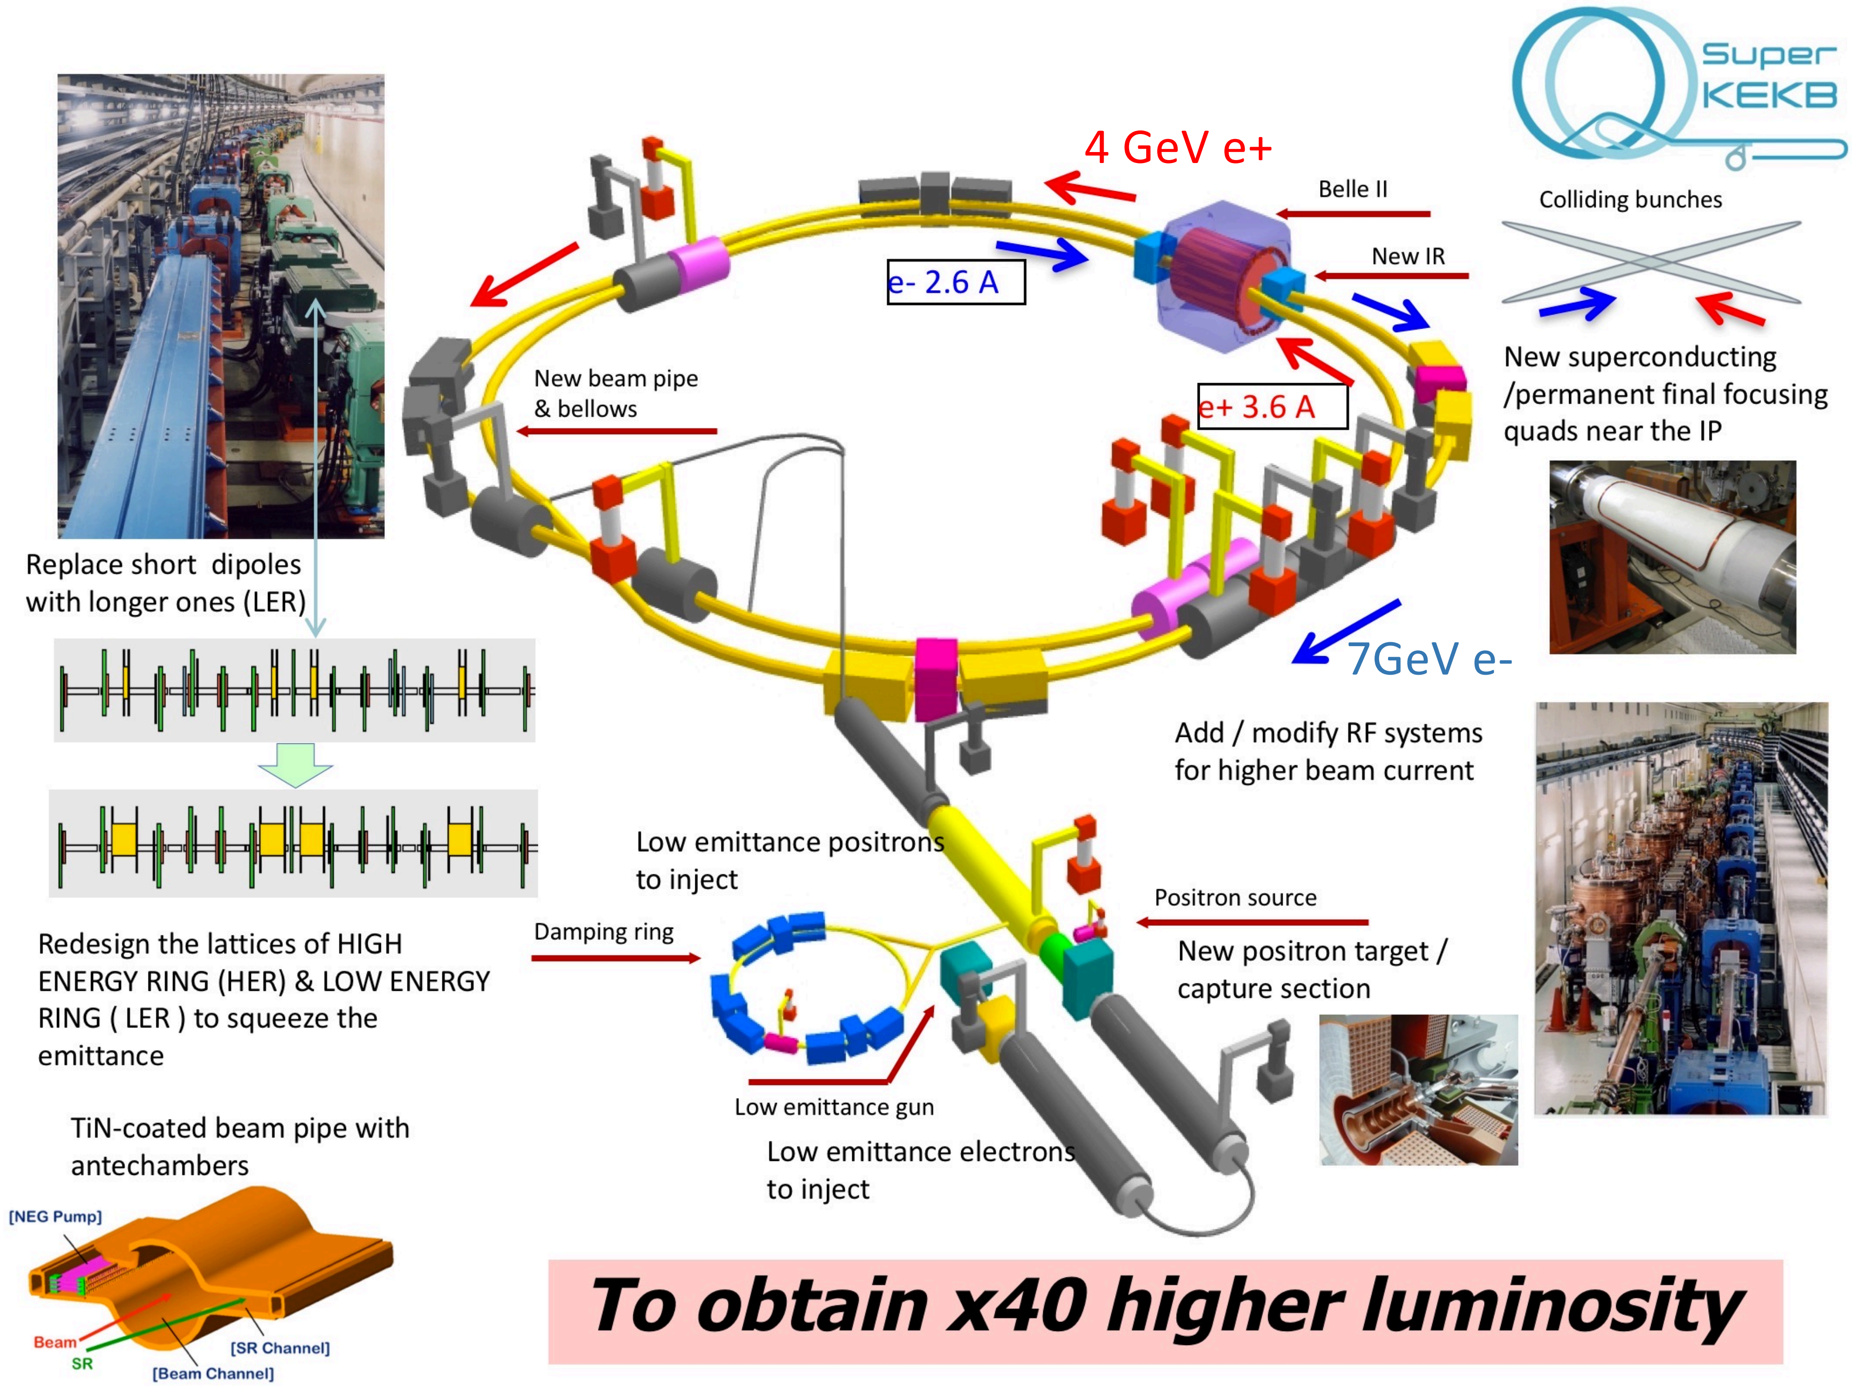
University of Victoria

8 December 2023

On behalf of the

Belle II/SuperKEKB e- Polarization Upgrade Working Group

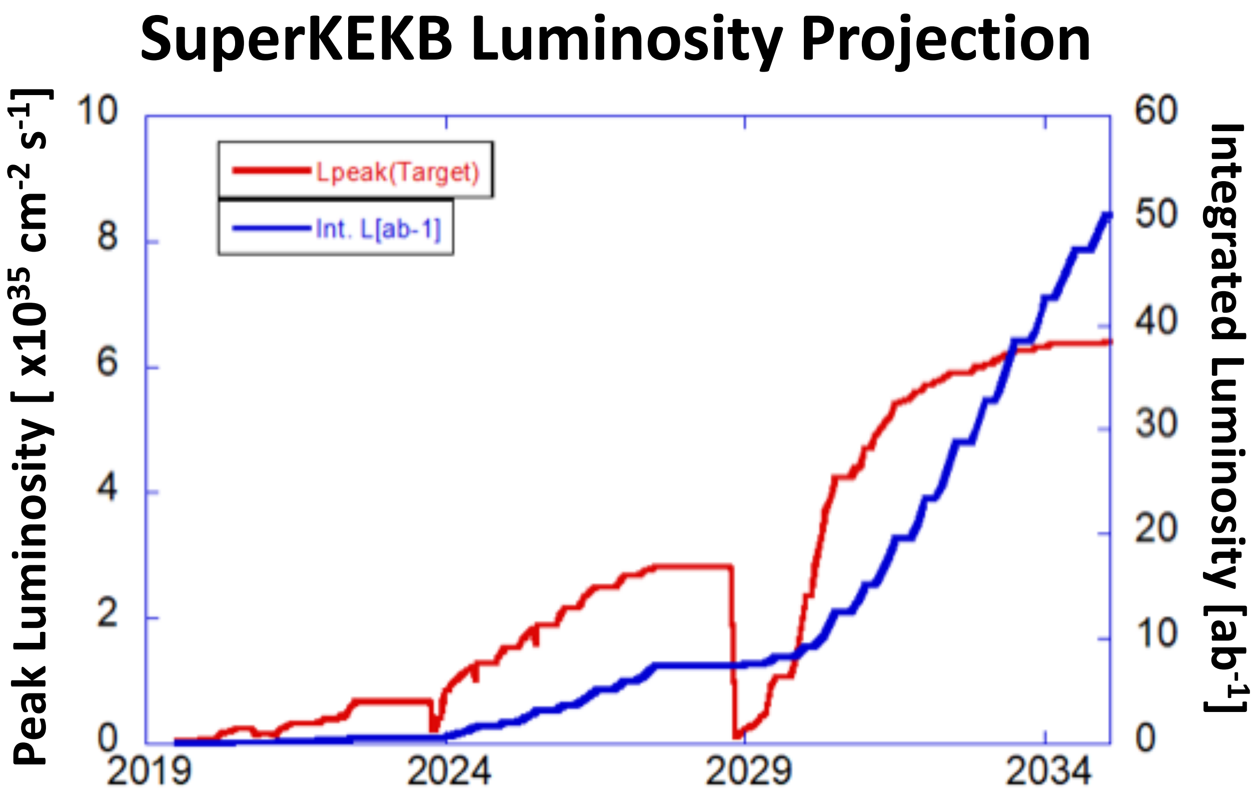
University of Victoria



Super KEKB
4 GeV e+
Belle II
Colliding bunches
e- 2.6 A
New IR
New beam pipe
& bellows
e+ 3.6 A
New superconducting
/permanent final focusing
quads near the IP
Replace short dipoles
with longer ones (LER)
7GeV e-
Add / modify RF systems
for higher beam current
Low emittance positrons
to inject
Positron source
Damping ring
New positron target /
capture section
Redesign the lattices of HIGH
ENERGY RING (HER) & LOW ENERGY
RING (LER) to squeeze the
emittance
Low emittance gun
TiN-coated beam pipe with
antechambers
Low emittance electrons
to inject
[NEG Pump]
Beam
SR
[SR Channel]
[Beam Channel]
To obtain x40 higher luminosity

SuperKEKB's HIGH LUMINOSITY drives the rich research program of Belle II and

getting to the design luminosity is our highest priority



SuperKEKB's HIGH LUMINOSITY drives the rich research program of Belle II and

getting to the design luminosity is our highest priority

FORTUITOUSLY, SuperKEKB's HIGH LUMINOSITY also enables an

entirely new, rich and unique physics program when we POLARIZE THE ELECTRONS BEAM

SuperKEKB's HIGH LUMINOSITY drives the rich research program of Belle II and

getting to the design luminosity is our highest priority

FORTUITOUSLY, SuperKEKB's HIGH LUMINOSITY also enables an

entirely new, rich and unique physics program when we POLARIZE THE ELECTRONS BEAM

Data with polarized e^- beam to be collected by Belle II and used simultaneously for conventional non-polarized beam physics program: no negative impact on the existing program

Upgrading SuperKEKB with polarized electrons

Opens New Windows for Discovery with Belle II

- **Extremely rich and unique high precision electroweak program**
- **Probe of Dark Sector**
- **Tau Lepton Magnetic Form factor $F_2(10GeV) \rightarrow \tau$ g-2**
- **Polarized Beam also provides:**
  - **Improved precision measurements of τ Michel Parameters, electric dipole moment (EDM)**
  - **Reduces backgrounds in $\tau \rightarrow \mu\gamma$ and $\tau \rightarrow e\gamma$ leading to significantly improved sensitivities**
- **hadronic studies**

A New Path for Discovery in a Precision Neutral Current Electroweak Program

- **Left-Right Asymmetries** (A_{LR}) yield high precision measurements of the neutral current vector couplings (g_V) to each of five fermion flavours, f :
  - beauty (D-type)
  - charm (U-type)
  - tau
  - muon
  - electron

$$\text{Recall: } g_V^f \text{ gives } \theta_W \text{ in SM} \begin{cases} g_A^f = T_3^f \\ g_V^f = T_3^f - 2Q_f \sin^2\theta_W \end{cases}$$

as well as light quarks

T_3 = -0.5 for charged leptons and D-type quarks
+05 for neutrinos and U-type quarks

‘Chiral Belle’ → Left-Right Asymmetries

- Measure difference between cross-sections with left-handed beam electrons and right-handed beam electrons
- Same technique as SLD A_{LR} measurement at the Z-pole giving single most precise measurement of :

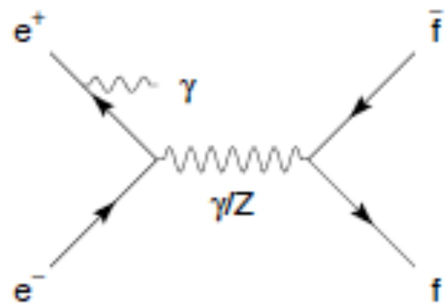
$$\sin^2\theta_{eff}^{lepton} = 0.23098 \pm 0.00026$$

At 10.58 GeV, polarized e^- beam yields product of the neutral current axial-vector coupling of the electron & vector coupling of the final-state fermion via Z-γ interference:

for s-channel Born:

$$A_{LR} = \frac{\sigma_L - \sigma_R}{\sigma_L + \sigma_R} = \frac{4}{\sqrt{2}}\left(\frac{G_F s}{4\pi\alpha Q_f}\right) g_A^e g_V^f \langle Pol \rangle$$

$$\propto T_3^f - 2Q_f \sin^2\theta_W$$



'Chiral Belle' → Left-Right Asymmetries

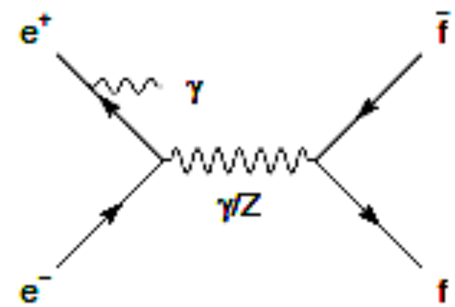
Electron helicity would be chosen for different bunch trains by controlling the circular polarization of the source laser illuminating a GaAs photocathode.

$$A_{LR} = \frac{\sigma_L - \sigma_R}{\sigma_L + \sigma_R} = \frac{4}{\sqrt{2}}\left(\frac{G_F s}{4\pi\alpha Q_f}\right) g_A^e g_V^f \langle Pol \rangle$$

$$\propto T_3^f - 2Q_f \sin^2\theta_W$$

$$\langle Pol \rangle = 0.5\left\{\left(\frac{N_R^{e-} - N_L^{e-}}{N_R^{e-} + N_L^{e-}}\right)_R - \left(\frac{N_R^{e-} - N_L^{e-}}{N_R^{e-} + N_L^{e-}}\right)_L\right\}$$

(for s-channel Born)



Source generates mainly right-handed electrons

Source generates mainly left-handed electrons

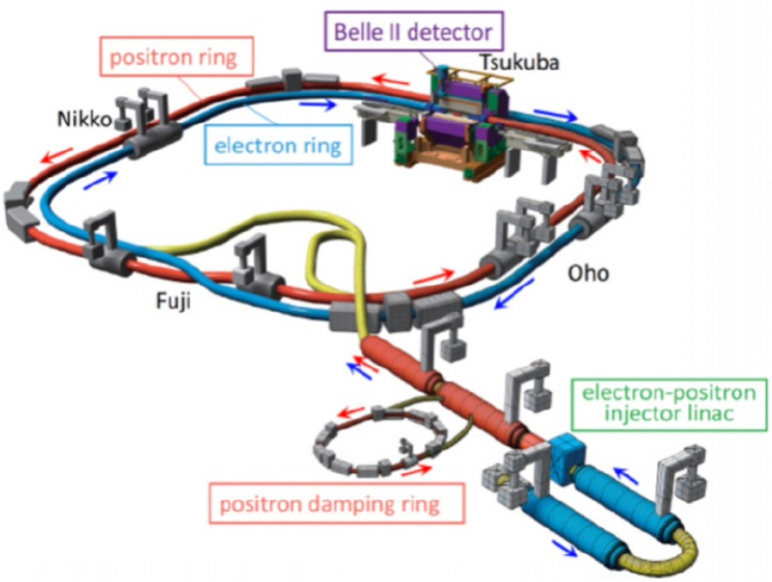
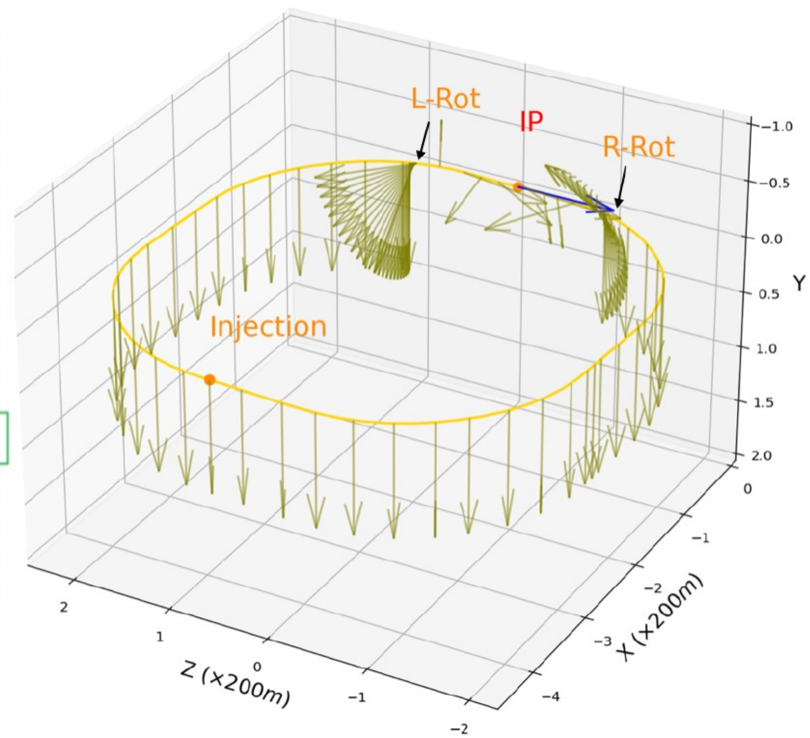
- **Detector level systematics cancels in asymmetries between left (right) beams.**
- **Precision $\simeq \mathcal{O}(10^{-5})$ or better expected with 50 ab^{-1} of data with polarized beam.**
- **1000 x more precise than current limits**
- **Approaches the precision regime in tau that starts to be sensitive to Minimal Flavour Violation equivalent of muon g-2 anomaly**

e- beam polarization in SuperKEKB

- Goal is ~70% polarization with 80% polarized source (SLC had 75% polarization at the experiment) producing longitudinal electron spins at source
- Electron helicity would be changed for trains of bunches by controlling the circular polarization of the source laser illuminating a GaAs photocathode (similar to SLC source)
- Inject transversely (vertically) polarized electrons into the High Energy Ring (HER) - needs spin rotator just after photocathode source, e.g. Wien Filter
- Rotate spin to longitudinal before IP, and then back to vertical after IP using solenoidal and dipole fields – requires Spin Rotators
- Use Compton polarimeter to monitor longitudinal polarization with <1% absolute precision, higher for relative measurements (arXiv:1009.6178) - needed for real time polarimetry
- Use tau decays to get absolute average polarization at IP

e- beam polarization in SuperKEKB





Polarization in SuperKEKB

- **These precision measurements require highest luminosity possible**
- **Polarized source not expected to reduce luminosity**
- **Spin rotators might affect luminosity if not carefully designed to minimize couplings between vertical and horizontal planes**
  - **Higher order and chromatic effects have to be considered in the design to ensure luminosity is not degraded**

e- beam polarization in SuperKEKB

- Requires highest SuperKEKB luminosity AND e- beam polarization
- Source R&D highly synergistic with other international efforts, e.g. EIC
- Requires spin rotators in HER that do not reduce the luminosity (i.e. transparent to the lattice) – high luminosity is required for Chiral Belle
- Requires Precision measurement of polarization (0.005 precision needed)

Beam Polarization: Can be measured to < 0.005

Precision e^- beam polarimetry at an e^+e^- B factory using tau-pair events

J. P. Lees *et al.* (*BABAR* collaboration)

Phys. Rev. D **108**, 092001 – Published 2 November 2023

Article | References | No Citing Articles | PDF | HTML | Export Citation

ABSTRACT

We present a new technique, "tau polarimetry," for measuring the longitudinal beam polarization present in an e^+e^- collider through the analysis of $e^+e^- \to \tau^+\tau^-$ events. By exploiting the sensitivity of τ decay kinematics to the longitudinal polarization of the beams, we demonstrate that the longitudinal polarization can be measured with a 3 per mil systematic uncertainty at the interaction point using a technique that is independent of spin and beam transport modeling. Using $424.2 \pm 1.8 \mathrm{fb}^{-1}$ of *BABAR* data at $\sqrt{s} = 10.58$ GeV, the average longitudinal polarization of the PEP-II e^+e^- collider has been measured to be $\langle P \rangle = 0.0035 \pm 0.0024_{\mathrm{stat}} \pm 0.0029_{\mathrm{sys}}$. The systematic uncertainty studies are described in detail, which can serve as a guide for future applications of tau polarimetry. A proposed e^- beam longitudinal polarization upgrade to the SuperKEKB e^+e^- collider would benefit from this technique.

ABSTRACT: The physics scope of the Belle II experiment currently acquiring data at the SuperKEKB collider will expand with a polarized electron beam upgrade, as recently proposed. Among the required elements for this upgrade, a real time diagnosis of the polarization is necessary to ensure it is large for all bunches in the accelerator during its regular operation. This will be realized by inserting a Compton polarimeter in the accelerator. Its conceptual design is described and no show-stopper for its integration has been identified. An estimation of the sensitivity of the polarimeter is made by means of toy Monte-Carlo studies. The proposed design accounts for the constraint to preserve the performance of the SuperKEKB accelerator and to cope with the short time separation of successive bunches. We show that the polarimeter will measure for each bunch the polarization within five minutes with a statistical precision below 1% and systematic uncertainties below 0.5%. It has the capability of providing this information online on a similar timescale. This work paves the way towards future implementation of real-time Compton polarimetry in several future projects.

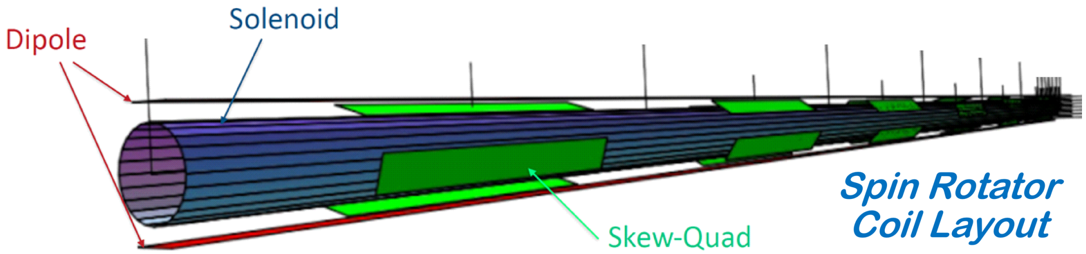
Compact spin rotator



Follows Uli Wienands's (Argonne National Laboratory) idea and direction:

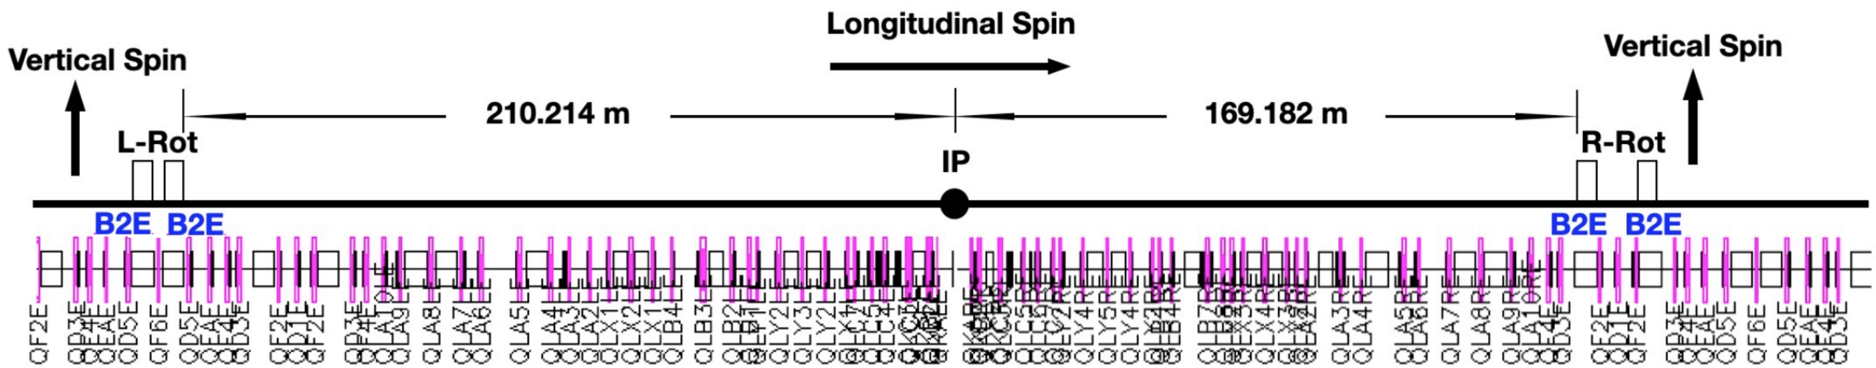
- **Replace some existing ring dipoles on both sides of the IP with the dipole-solenoid combined function magnets and keep the original dipole strength to preserve the machine geometry**
- **Avoids repositioning of other magnets in the ring**
- **Install 6 skew-quadruple on top of each rotator section to compensate for the x-y plane coupling caused by solenoids**

Original machine can be recovered by turning off solenoid and skew-quadrupole fields + retune with only the dipoles

(BNL expertise in construction of direct wind magnets suitable for these magnets)

Compact spin rotator

Y. Peng (UVic) with Uli Wienands (ANL)



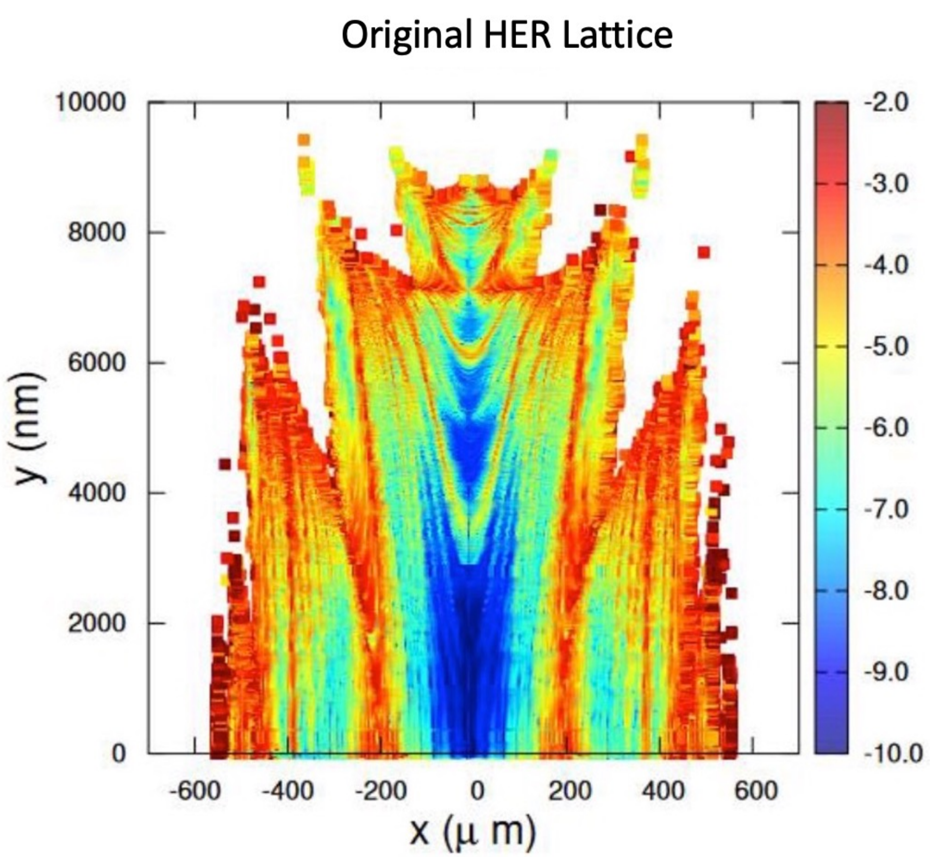
- Left Rotator (L-Rot) rotates the spin from the vertical to the horizontal plane
- Right Rotator (R-Rot) rotates the spin back to the vertical direction
- 4 **B2E** dipoles (using SAD lattice naming convention for HER) shown above to be replaced with the spin rotator magnets

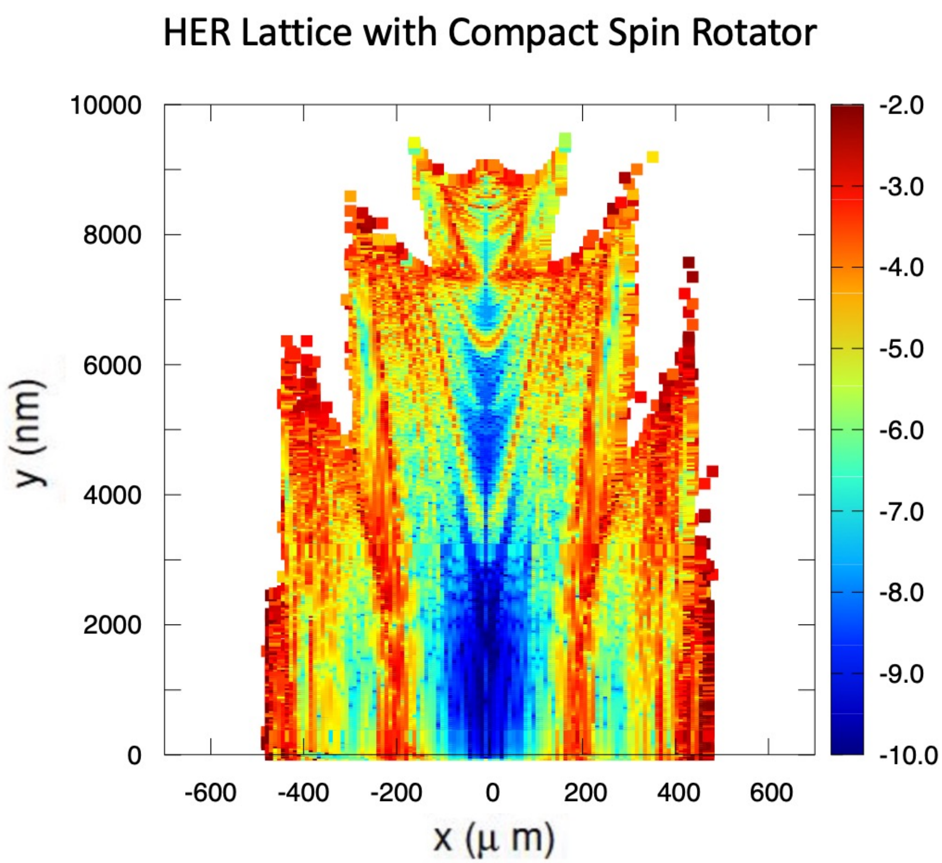
Compact spin rotator

Frequency Map Analysis (FMA)

dynamic aperture studies using BMAD – show no large changes

Noah Tessema (UVic) advised by D. Zhou (KEK), U. Wienands (ANL)





Compact spin rotator

Long Term Tracking(LTT): **Explores *non-linear* features of beam lifetime and polarization lifetime with radiation damping and radiation fluctuations/quantum excitation**

BMAD LTT studies [N. Tessema (UVic) + U. Wienands (ANL)] of Peng-Wienand spin rotator solution after improving the dipole model in BMAD deployed for these compact magnets

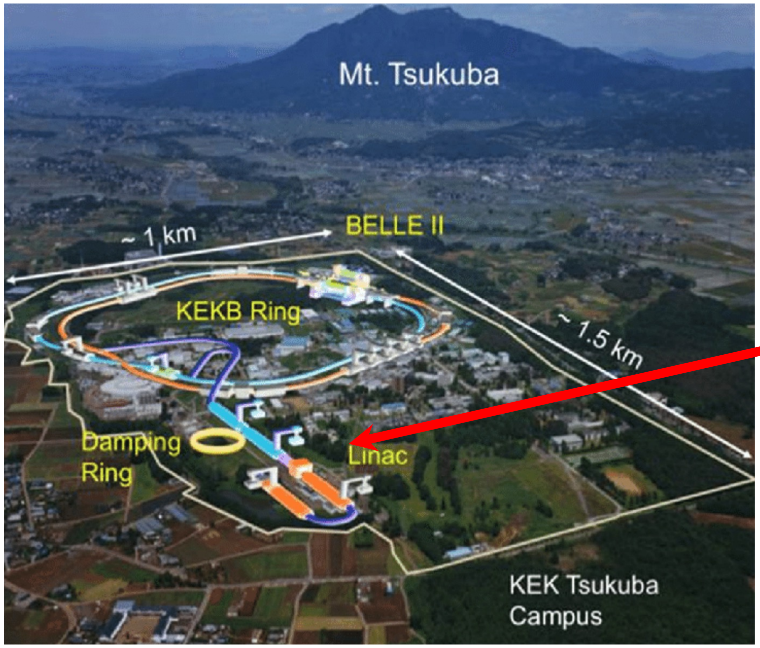
Conclusion:

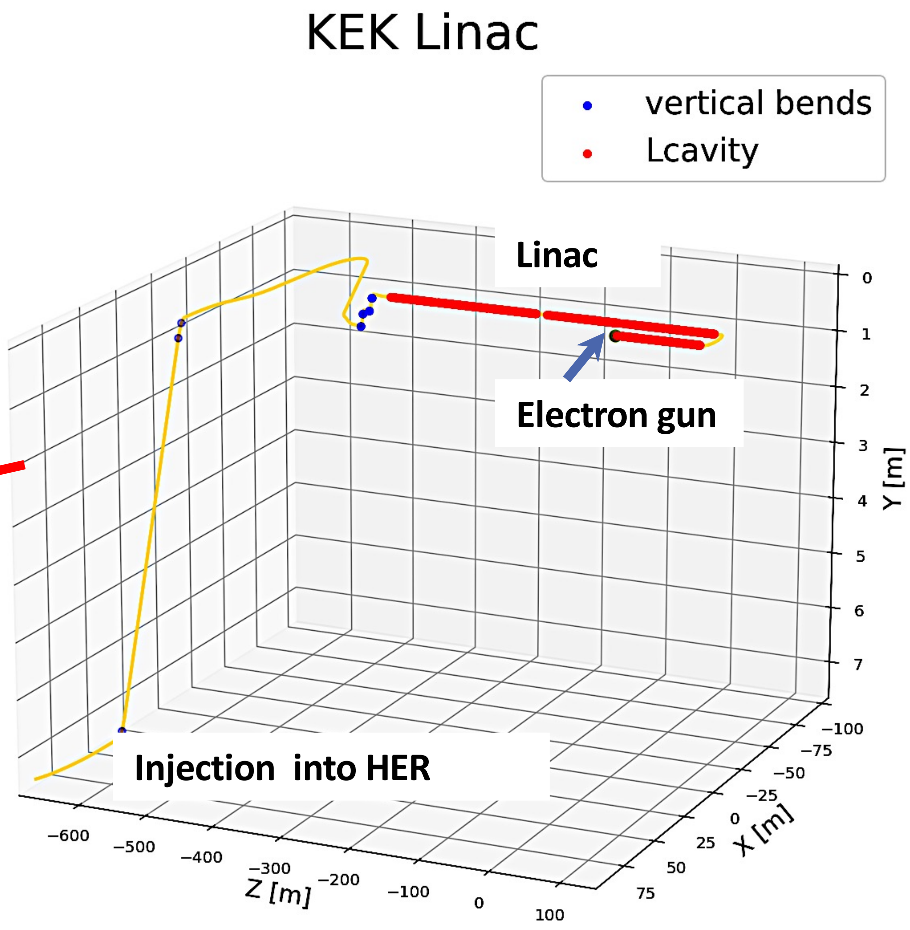
- **Beam is stable with compact spin rotators (5 million turns with 20 particles – no lost particles)**
- **Good polarization lifetime of ~25 minutes (~10 top-up times) with HER energy of 7.035 GeV (0.4% [i.e.+28MeV] higher than default energy) – currently using LTT to map lifetime vs energy to maximize polarization lifetime & for resonant depolarization considerations**

Compact Spin Rotator provides solution to transparency with minimal changes to lattice AND ability to have SuperKEKB with no spin rotator when we do not run with polarized beams – LTT studies show minimal impact on beam & polarization lifetimes

Next step: Propose to put LTT studies to the test with data in experiment with TRANSVERSE polarized beam to validate polarization lifetime

Inject transversely polarized beam at the HER injection point

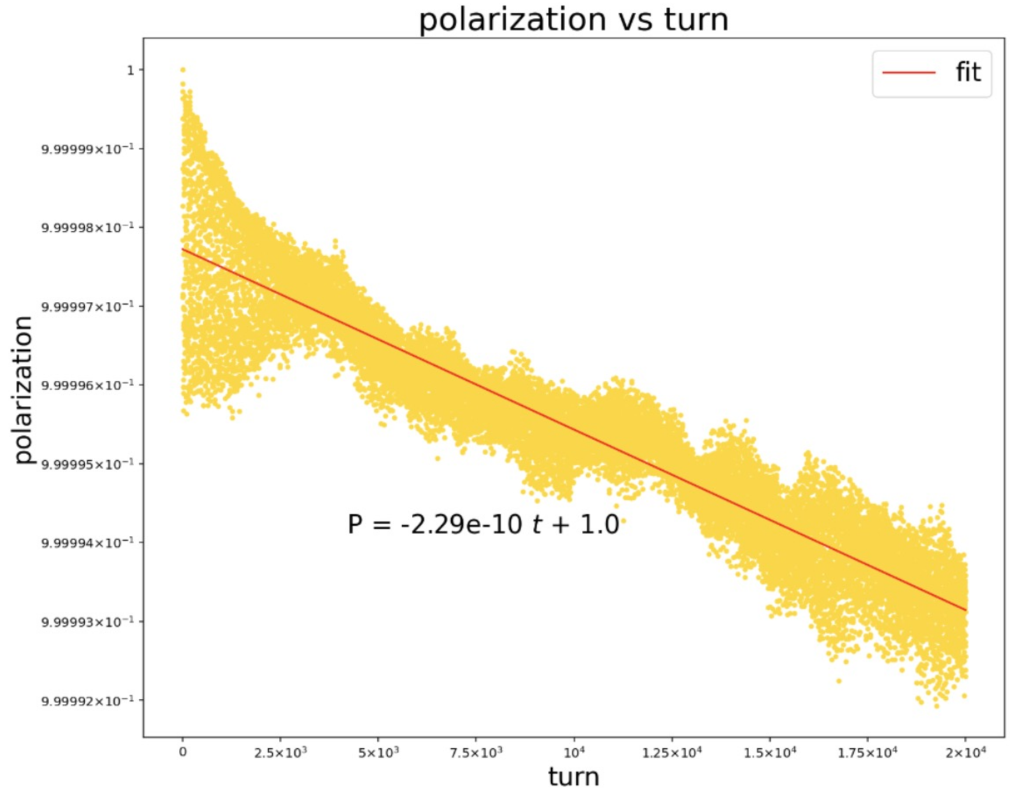




KEK Injection Linac polarization BMAD studies

KEK Injection Linac polarization BMAD studies

Inject transversely polarized beam at the HER injection point



Transverse polarization survival rate in HER

Y. Peng's (UVictoria)

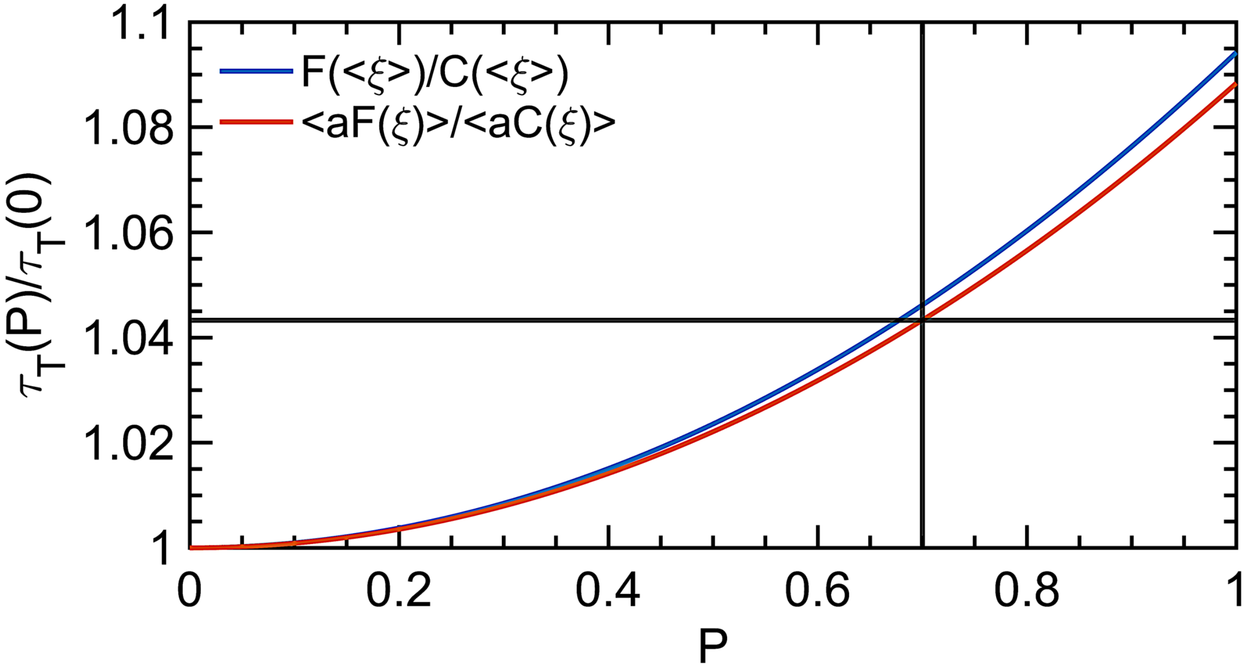
- **Tracking 100 particles for 20000 turns in the HER with BMAD**
- **This study estimates polarization lifetime > 10 hours**

History of Touschek lifetime being used to measure transverse polarization

- Touschek described the lifetime of electrons in AdA ('accumulation ring') in 1963 (Bernardini et al., Phys. Rev. Lett 10 (1963) 407)
- Baier & Khoze, pointed out that Touschek lifetime is sensitive to polarization (At. Energ. 25 (1968) 440)
- It was then use in the VEPP-2M ring to measure depolarization (and thus beam energy): Derbenev Part. Acc. 8 (1978) 115
  - Measuring the counting rate of scattered electrons
- Ex: Allowed first precision mass measurement of J/Psi (3096.93+-0.09 MeV) then superseded in 1993 (E760)
- Continously improved at VEPP-4M (KEDR at VEPP-4M: 3096.900 ± 0.002 ± 0.006 MeV): Phys. Lett 96B (1980) 214; Blinov et al., proc. of EPAC (2002) 1954

- More recently used at :
  - HIgS (DUKE): NIMA 614 (2010) 339
  - SOLEIL, NIMA 697 (2013) 1
  - Diamond Light Source, PRAB22 (2019) 122801
  - Based on expressions given in NIMA 554 (2005) 85
  - Also proposed for FCCee: arXiv1909.12245

For SuperKEKB



For 70% polarization this is a ~4% effect assuming (overall) momentum acceptance of 0.6%

[Aurélien Martens (IJCLab) presentation in Feb 2023 B2GM and described in current draft of Chiral Belle CDR]

Touschek lifetime measurements already performed in HER with required precision

From **KEK Roadmap 2021** (May 31, 2021)

"Other proposals for future research, such as measurements using the Belle II detector and polarized electrons requiring ***a modest upgrade to SuperKEKB****, have been made. R&D will continue to examine the technical feasibility of such projects while confirming their physics impact."*

Snowmass 2021 White Paper

Upgrading SuperKEKB with a Polarized Electron Beam: Discovery Potential and Proposed Implementation

arXiv:2205.12847 (Sept. 2022)

Conceptual Design Report for polarization upgrade is being drafted

Feasible to plan for installation towards end of this decade with collisions with polarization data starting while SuperKEKB completes its program of delivering 50ab^{-1} of data and continued beyond that program.

Summary

Chiral Belle Physics Program

Unique New Physics Probe into Dark Sector via Precision measurement of weak mixing angle @ 10GeV with e, μ, τ, c and b
5x precision of EIC

Going beyond muon g-2 Measured at BNL & FERMILAB:
Tau g-2
>100x more precise than can be reached elsewhere

Worlds Highest Precision Weak Neutral Current Measurements with μ, c and b
Many times more precise than World Average of CERN & SLAC measurements
Avoids LHC hadronization uncertainties

Worlds Highest Precision Weak Neutral Current Universality Measurements with e, μ, τ, c and b many times more precise than CERN & SLAC measurements

Summary

- **Unique, High-Impact Precision Physics Program**
- **0.3% Beam polarization systematic uncertainty can be reached with both Tau Polarimetry and Compton Polarimetry**
- **Compact Spin Rotator provides solution to transparency with minimal changes to lattice AND ability to have SuperKEKB with no spin rotator (i.e. just use the dipole field) when we do not run with polarized beams – LTT studies show minimal impact on beam lifetime and polarization lifetime**
- **Next step: Put LTT studies to the test with data in experiment with TRANSVERSE polarized beam to validate polarization lifetime**

Additional Information

Compact spin rotator

Full lattice Comparison with L/R-Rot installed & matched in the HER ring
