## Azimuthal transverse single-spin asymmetries of hadrons within jets from polarized $pp$ collisions at $\sqrt{s} = 510$ GeV

Tuesday 27 August 2024 12:00 (20 minutes)

The examination of the origins of transverse single-spin asymmetries has catalyzed the advancement of twist-3 formalism and transverse-momentum-dependent parton distribution functions (TMDs). The azimuthal distribution measurements of identified hadrons within a jet in transversely polarized hadronic interactions offer crucial insights into TMD physics, particularly the Collins effect, which involves quark transversity and the Collins fragmentation functions.

The STAR collaboration has reported on the measurements of Collins asymmetries from jet +  $\pi^\pm$  production in transversely polarized proton-proton ( $pp$ ) collisions at a center-of-mass energy of  $\sqrt{s} = 500$  GeV. These results are derived from data collected in 2011, with an integrated luminosity of  $23 \text{ pb}^{-1}$ . Additionally, comprehensive measurements of azimuthal transverse single-spin asymmetries of hadrons within jets from transversely polarized  $pp$  collisions at  $\sqrt{s} = 200$  GeV were performed using data from 2012 and 2015.

In 2017, STAR acquired a substantially larger  $pp$  dataset with an integrated luminosity of  $320 \text{ pb}^{-1}$  at  $\sqrt{s} = 510$  GeV. This large dataset is expected to significantly enhance the precision of transverse single-spin asymmetry measurements, particularly in the high jet transverse momentum region.

This talk presents preliminary results on azimuthal transverse single-spin asymmetries for charged pions within jets from transversely polarized  $pp$  collisions at  $\sqrt{s} = 510$  GeV. The comparison of Collins asymmetries in  $pp$  collisions at 200 GeV and 510 GeV can provide constraints on the evolution effect of Collins function. Simultaneously, comparing the experimental results from  $pp$  collisions with theoretical models obtained by global fits based on semi-inclusive deep inelastic scattering and  $e^+e^-$  annihilation data can test the universality of Collins asymmetries.

### Internet talk

Yes

### Is this an abstract from experimental collaboration?

Yes

### Name of experiment and experimental site

STAR Collaboration, Upton, NY

### Is the speaker for that presentation defined?

Yes

### Details

Yixin Zhang, Mr, Shandong University, China

**Primary author:** Mr ZHANG, Yixin (Shandong University)

**Presenter:** Mr ZHANG, Yixin (Shandong University)

**Session Classification:** High Energy Particle Physics

**Track Classification:** Main topics: High Energy Particle Physics
