

Characterisation of the Bucharest $\text{LaBr}_3\text{:Ce}$ -HPGe Fast-timing gamma-ray Array

Experiment at the Bucharest Tandem

Thamer Alharbi

- Introduction
- Experiment
- Array Set-up
- Delayed coincidences fast-timing method
- Properties of $\text{LaBr}_3:\text{Ce}$
- Time-walk
- Results
- Acknowledgements

- A new generation of inorganic scintillators.
- Very good timing resolution $\sim 5\text{ns}$ (FWHM) Ge, $\sim 200\text{ps}$ (FWHM) LaBr_3 .
- Good energy resolution $\sim 3\%$ at 1MeV .
- The combination of high light yield (63000 ph/MeV), short rise time (16 ns) and high density ($\rho = 5.3\text{ g/cm}^3$) makes the LaBr_3 one of the best scintillators.

Experiment

- Nuclei of interest were populated through the $^{18}\text{O} + ^{18}\text{O}$ fusion-evaporation reaction at the Tandem accelerator at IFIN-HH, Bucharest, Romania.
- $50 \text{ mg/cm}^2 \text{ Ta}_2^{18}\text{O}_5$ enriched target.
- 36 MeV ^{18}O beam from Bucharest Tandem (typical beam current $\sim 20 \text{ pA}$).
- Measure reaction gammas from array of 8xHPGe and 7xLaBr₃ detectors.
- Master gate, either 2xLaBr₃ OR 3xHPGe for a valid event.

P.J.R Mason et al. results

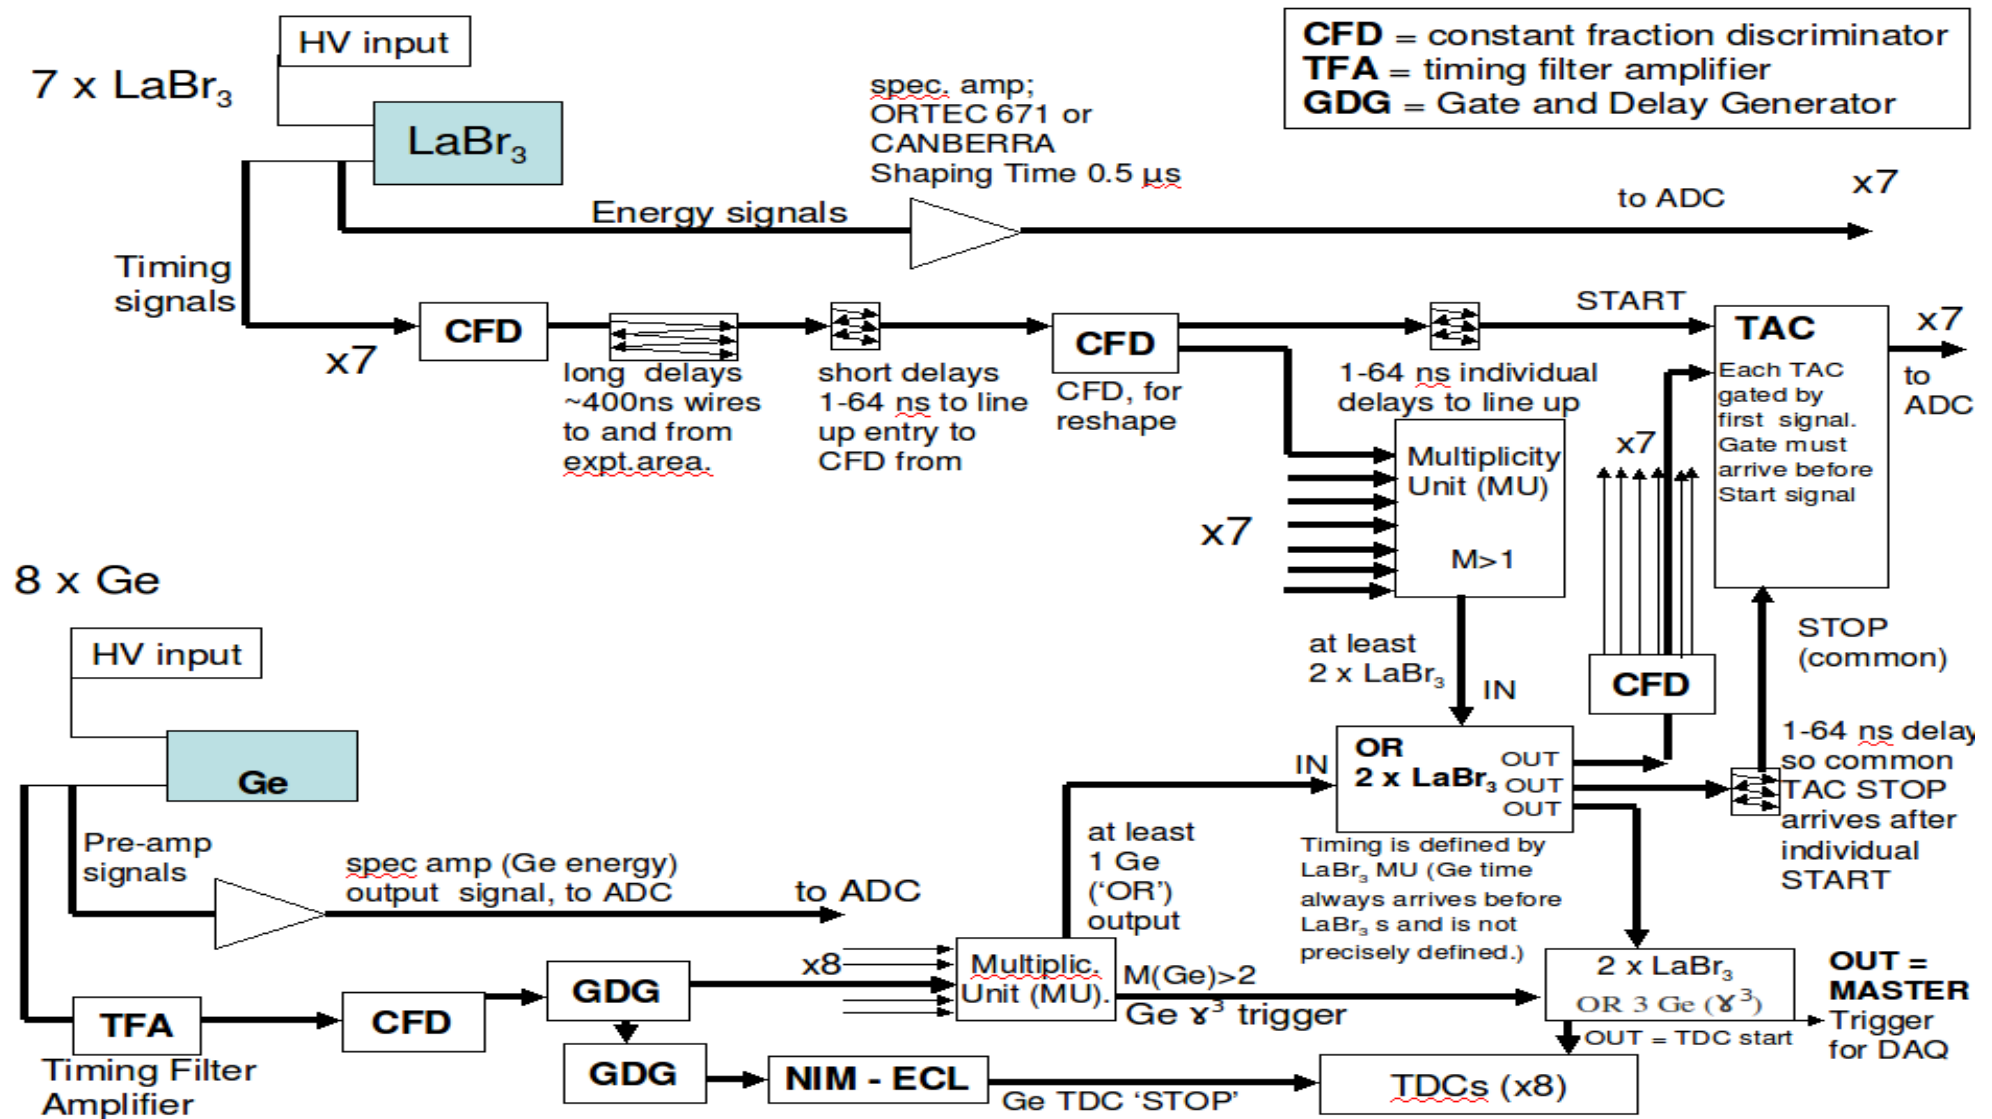

Array Set-up

- The detection of gamma-rays was made with 8 HPGe detectors each with relative efficiency around 50%, six of them were placed at 35° , two at 90° .
- The $\text{LaBr}_3:\text{Ce}$ detectors were placed at 45° .
- Three different geometry were used of the $\text{LaBr}_3:\text{Ce}$
 - 2"x2" (three) (Cylindrical)
 - 1.5"x1.5" (two) (Cylindrical)
 - 1.5"x1.5" (two) (Conical)

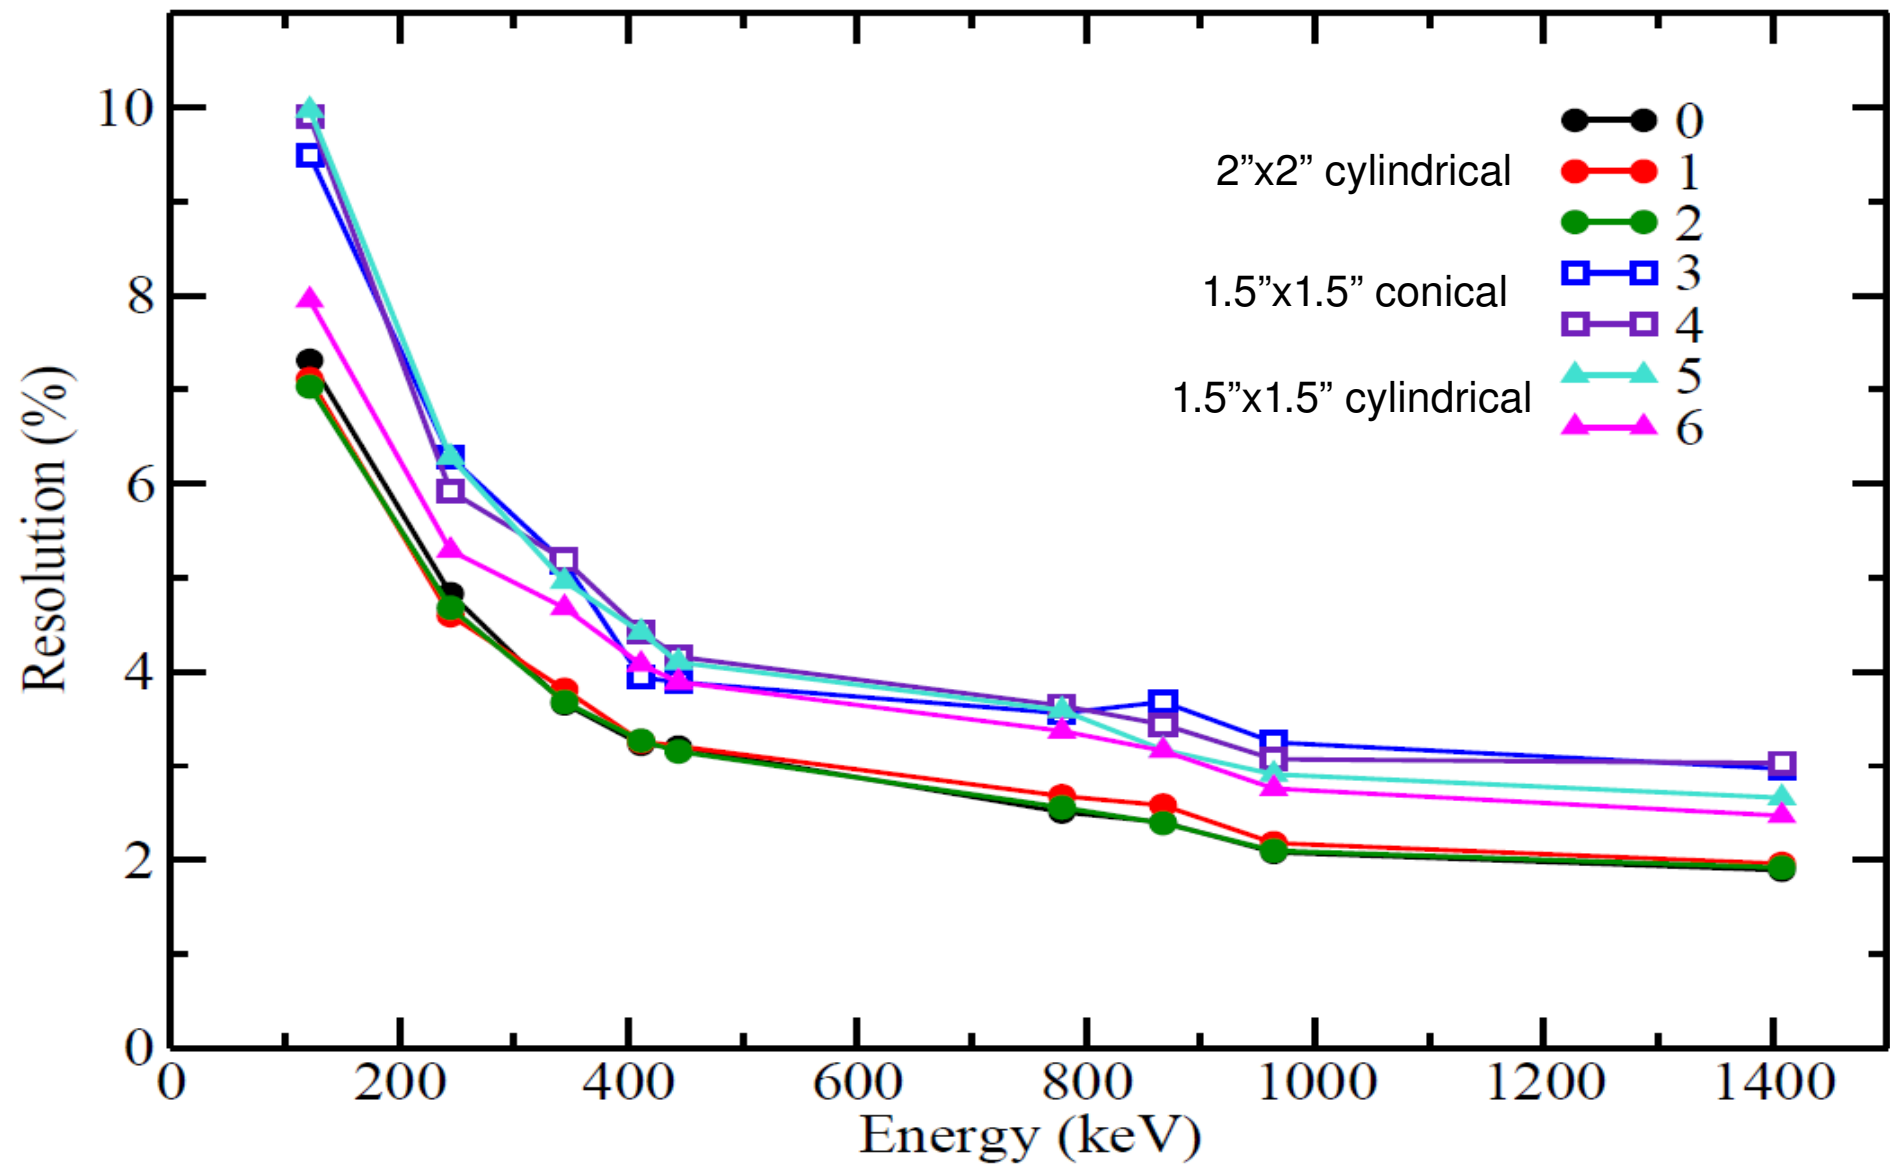

Delayed coincidences fast-timing method

- A delayed triple γ -coincidences technique was applied in the experiment with a condition of at least 2 LaBr_3 OR 3 Ge fired.
- Dynode from each LaBr_3 was used for the timing and the last anode for energy signal.

Substantial gain drift through-out experiment requires run-by-run gainmatching

Relative Efficiency

The relative efficiency of these different $\text{LaBr}_3\text{:Ce}$ detectors were measured using data from ^{152}Eu , $^{56,57}\text{Co}$ and ^{60}Co sources.

Detector Performance

Typical time resolutions (FWHM, for the ^{60}Co source peak-to-peak coincidences)

Were about 150 ps for (1"x1") detectors

180 ps for (1.5"x1.5") detectors

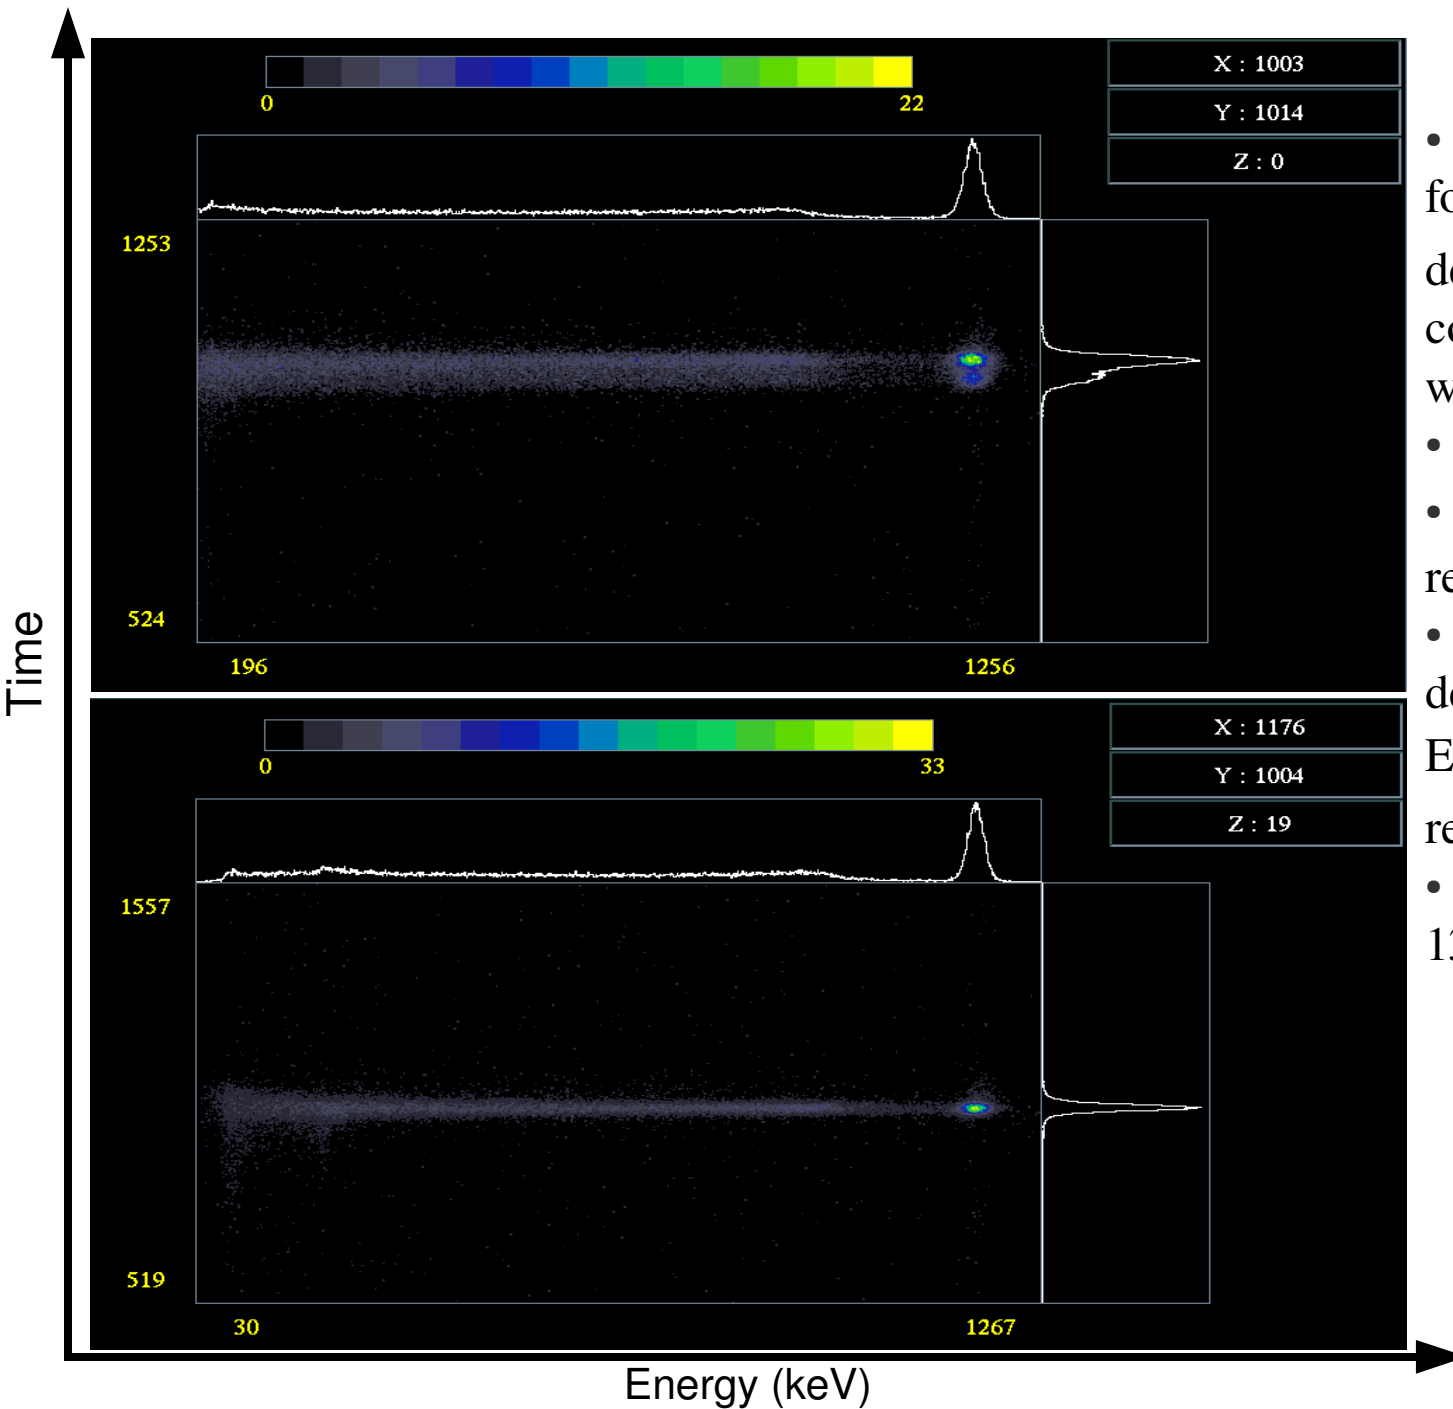

300 ps for (2"x2") detectors

N. Mărginean, *et al* Eur. Phys. J. A 46, 329–336 (2010)

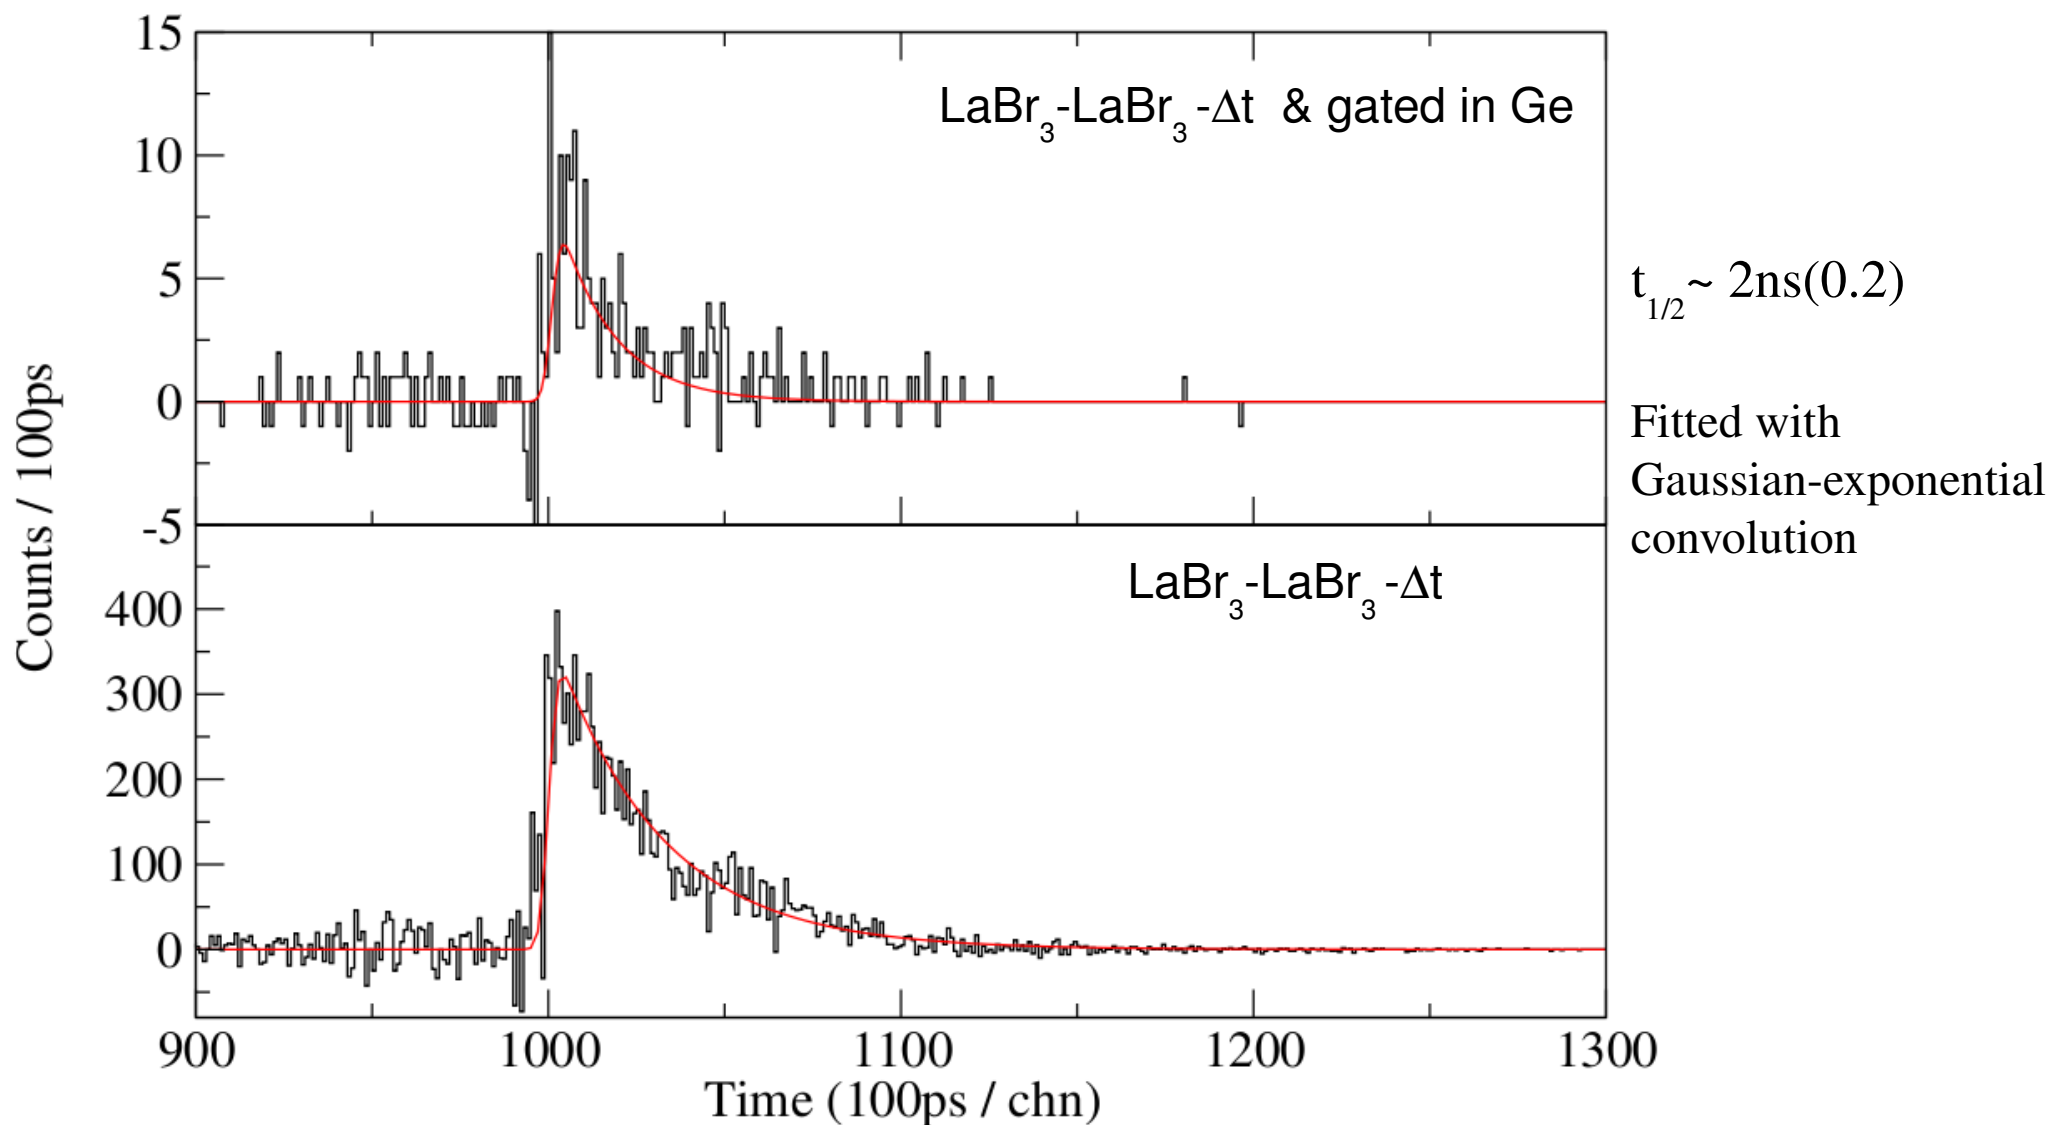

Time-walk Correction

- The instrumental time response for each combination of a LaBr_3 detector and a CFD requires a correction because of the time walk.
- ^{60}Co placed at target position.
- One LaBr_3 taken as time reference.
- Then, for each of the rest detectors build a matrix between E_γ and Δt with respect to the reference detector.
- Time reference detector gated on 1332 keV full-energy peak.

PRELIMINARY

Thank you
