# Angular Analysis of $B_{d} \rightarrow J / \psi K^{*}$ 

## Ailsa Sparkes

LHCb UK Meeting, Glasgow

## 4th April 2011

## 

## Overview

- Motivation
- LHCb Detector
- $B_{d} \rightarrow J / \psi K^{*}$ Analysis Method
- Results
- Conclusion

## Motivation

- $B_{d} \rightarrow J / \psi K^{*}$ has already been measured accurately by BaBar, Belle and CDF
- It is an important control channel for $B_{s} \rightarrow J / \psi \phi$ which is key for measuring the CP violating phase $\phi_{s}$
- Similar angular distributions described by three transversity angles
- Polarisation amplitudes measured by angular analysis
- Verifies our understanding of detector effects
- It is self-tagging - the charge of the Kaon in the final state indicates the flavour of the $B$ meson
- Used to verify tagging methods used in LHCb
- With high statistics can measure direct CP violation and Cabibbo-supressed $B_{s} \rightarrow J / \psi K^{*}$
$B_{d} \rightarrow J / \psi K^{*}$
- Angular distribution described by 3 transversity angles $\theta, \phi$ and $\psi$

- $\theta$ and $\phi$ are the polar and azimuthal angles of the $\mu^{+}$in the $J / \psi$ rest frame
- $\psi$ is the angle between the momentum of the $K^{+}$and $B$ in the rest frame of the $K^{*}$

## LHCb Detector - Production of $b / \bar{b}$ 's in forward direction

- VELO for precise vertexing
- RICH detectors identify charged particle (important for $K^{*} \rightarrow K^{ \pm} \pi^{\mp}$ )
- Muon detectors also vital for reconstruction of $J / \psi \rightarrow \mu^{+} \mu^{-}$and triggering

## Method

(1) Select Data

- Dataset from 2010 corresponding to $\mathcal{L}=36 p b^{-1}$
- Lifetime unbiased trigger lines only - fully efficient for all B lifetimes
(2) Unbinned maximum likelihood fit extracting physics parameters whilst understanding:
- Lifetime and Angular Acceptance
- Backgrounds
(3) Systematic Uncertainties

## Fit Procedure

- Unbinned Maximum Likelihood fit in B-mass m, proper time $t$, and decay angles $\Omega=(\cos \theta, \phi, \cos \psi)$
- Probability Density function consisting of signal $\mathcal{S}$ and background component $\mathcal{B}$ :

$$
\mathcal{P}=f_{\text {sig }} \mathcal{S}(m) \mathcal{S}(t, \Omega)+\left(1-f_{\text {sig }}\right) \mathcal{B}(m) \mathcal{B}(t, \Omega)
$$

- Signal description given by differential decay rate:

$$
\mathcal{S}(t, \Omega)=\frac{d \Gamma\left(B_{d} \rightarrow J / \psi K^{*}\right)}{d \Omega d t}
$$

- Physics Parameters to extract:
- Decay Width $\Gamma_{d}$, Polarization amplitudes $\left|A_{\|}\right|^{2},\left|A_{\perp}\right|^{2},\left|A_{0}\right|^{2}$ and phases $\delta_{\|}, \delta_{\perp}, \delta_{0}$
- Including $\left|A_{s}\right|^{2}$ and $\delta_{s}$ for description of the $m_{K \pi}$ dependent S -wave component as well as the P wave.

## Time Resolution and Angular Acceptance

- Finite proper time resolution model three Gaussian fit including all proper times (prompt excluded for final fit)

- Angular acceptance correction calculated from Monte Carlo using a 3D histogram in bins of the transversity angles $\Omega$ :

## Background Description

- Sources of Background:
- Random combinations of four tracks
- Prompt $J / \psi$ events combined with random tracks
- True long-lived $J / \psi$ from other $B_{d} \rightarrow J / \psi X$ decays
- Long-lived combinatorial background
- Modelling the background
- Cut on proper time at $t>0.3 p s$ removes most of the prompt background
- Two long lived components modelled using sidebands of $B$ mass
- Angular dependence of the background has been described by a 3D histogram
- Additional background component seen in Monte Carlo - 'wrong signal' which is reconstructed with wrong pion contributes $\approx 10 \%$ of the background

## Fit Results

- Single Gaussian for mass signal
- Shallow exponential plus Gaussian for background

- Exponential for the signal
- Double exponential for the background

## Transversity Angles

- Fitted signal
- Fitted background
- Wrong -signal background
- S-wave component

## Results

- The following are the parameters from the final fit result with $2631 \pm 51$ signal candidates
- Within errors these are consistent with earlier measurements

| Parameter | Result |
| :---: | :---: |
| $\Gamma_{d}$ | $0.661 \pm 0.020 \pm 0.018$ |
| $\left\|A_{\\|}\right\|^{2}$ | $0.252 \pm 0.020 \pm 0.016$ |
| $\left\|A_{\perp}\right\|^{2}$ | $0.178 \pm 0.022 \pm 0.017$ |
| $\delta_{\\|}$ | $-2.87 \pm 0.11 \pm 0.10$ |
| $\delta_{\perp}$ | $3.02 \pm 0.10 \pm 0.07$ |
| $\left\|A_{s}\right\|^{2}$ | $0.051 \pm 0.022$ |
| $\delta_{s}$ | $2.16 \pm 0.15$ |

| Parameter | BaBar Result |
| :---: | :---: |
| $\Gamma_{d}$ (PDG) | $0.656 \pm 0.017$ |
| $\left\|A_{\\|}\right\|^{2}$ | $0.211 \pm 0.010 \pm 0.006$ |
| $\left\|A_{\perp}\right\|^{2}$ | $0.233 \pm 0.010 \pm 0.005$ |
| $\delta_{\\|}$ | $-2.93 \pm 0.08 \pm 0.04$ |
| $\delta_{\perp}$ | $2.91 \pm 0.05 \pm 0.03$ |

- There is an S-wave component of $5 \pm 2 \%$

## Systematic Uncertainties

- All systematic uncertainties considered are shown in the table below:

| Systematic Effect | $\left\|A_{\\|}\right\|^{2}$ | $\left\|A_{\perp}\right\|^{2}$ | $\delta_{\\|}$ | $\delta_{\perp}$ |
| :---: | :---: | :---: | :---: | :---: |
| proper time acceptance | - | - | - | - |
| data/MC differences | 0.008 | 0.006 | 0.07 | 0.05 |
| statistical error of acceptance | 0.002 | 0.001 | - | 0.01 |
| wrong-signal fraction | 0.004 | 0.001 | - | 0.01 |
| background treatment | 0.002 | 0.008 | 0.04 | 0.01 |
| statistical error of background | 0.008 | 0.005 | 0.02 | 0.01 |
| mass model | 0.010 | 0.002 | 0.01 | 0.01 |
| s-wave treatment | 0.001 | 0.013 | 0.05 | 0.05 |
| sum | 0.016 | 0.017 | 0.10 | 0.07 |

## Summary

- The decay $B_{d} \rightarrow J / \psi K^{*}$ provides a valuable control sample for $B_{s} \rightarrow J / \psi \phi$ since it occurs via similar decay amplitudes which are already well measured
- The preliminary results presented here are consistent with previous results and therefore confirm that we understand our detector
- With data from 2010 and 2011, LHCb will improve the uncertainty on the results presented here and will go on to measure direct CP violation in $B_{d} \rightarrow J / \psi K^{*}$.

For more information see: LHCb-Conf-2011-001 LHCb-Conf-2011-002

## Backup

- The differential decay rate for $B_{d} \rightarrow J / \psi K^{*}$ is:

$$
\begin{array}{r}
\frac{d^{4} \Gamma}{d t d \Omega}=e^{-\Gamma_{d} t}\left[f_{1}(\Omega)\left|A_{0}(0)\right|^{2}+f_{2}(\Omega)\left|A_{\|}(0)\right|^{2}\right. \\
+f_{3}(\Omega)\left|A_{\perp}(0)\right|^{2} \\
\pm f_{4}(\Omega) \sin \left(\delta_{\perp}-\delta_{\|}\right)\left|A_{\|}(0)\right|\left|A_{\perp}(0)\right| \\
+f_{5}(\Omega) \cos \delta_{\|}\left|A_{0}(0)\right|\left|A_{\|}(0)\right| \\
\left. \pm f_{6}(\Omega) \sin \delta_{\perp}\left|A_{0}(0)\right|\left|A_{\perp}(0)\right|\right]
\end{array}
$$

## Selection

| Decay mode | Cut parameter | Stripping value | Offline value |
| :---: | ---: | :--- | :--- |
| $J / \psi \rightarrow \mu \mu$ | $\Delta \ln \mathcal{L}_{\mu \pi}$ | $>0$ | - |
|  | $\chi_{\text {track }}^{2} / \mathrm{nDoF}(\mu)$ | $<5$ | $<4$ |
|  | $\min \left(P^{T}\left(\mu^{+}\right), p T\left(\mu^{-}\right)\right)$ | - | $>0.5 \mathrm{GeV}$ |
|  | $\chi_{\mathrm{vtx}}^{2} / \mathrm{nDoF}(J / \psi)$ | $<16$ | $<11$ |
|  | $\mid M\left(\mu^{+} \mu^{-}\right)-M_{J / \psi}$ | $<80 \mathrm{MeV}$ | - |
|  | $\left\|M_{J / \psi(\text { reco })}-M_{J / \psi(P D G)}\right\| / \sigma_{m} / \psi$ | - | $<1.4 \times 3$ |
|  | $J / \psi$ mass constrained to PDG value |  |  |
|  |  |  |  |

| Decay mode | Cut parameter | Stripping value | Offline value |
| :---: | :---: | :---: | :---: |
| $K^{*} \rightarrow K \pi$ | $\begin{array}{r} \Delta \ln \mathcal{L}_{K \pi} \\ \Delta \ln \mathcal{L}_{K p} \\ \chi_{\text {track }}^{2} / \mathrm{nDoF}(K, \pi) \\ \mathrm{pT}\left(\mathrm{~K}^{* 0}\right) \\ \left\|M\left(K^{+} \pi^{-}\right)-M\left(K^{*}\right)\right\| \\ \chi_{\mathrm{vtx}}^{2} / \mathrm{nDoF}\left(K^{*}\right) \end{array}$ | $\begin{aligned} & >-2 \\ & - \\ & <5 \\ & >1 \mathrm{GeV} \\ & <90 \mathrm{MeV} \\ & <16 \end{aligned}$ | $\begin{aligned} & >0 \\ & >-2 \\ & <4 \\ & - \\ & <70 \mathrm{MeV} \end{aligned}$ |
| $B_{d} \rightarrow J / \psi K^{*}$ | $\begin{array}{r} M\left(B_{d}\right) \\ p T\left(B_{d}\right) \\ \chi_{\mathrm{vtx}}^{2} / \mathrm{nDoF}\left(B_{d}\right) \\ \chi_{\mathrm{DTF}(\mathrm{~B}+\mathrm{PV})}^{2} / \mathrm{nDoF}\left(B_{d}\right) \\ I P \chi^{2}\left(B_{d}\right) \end{array}$ | $\begin{aligned} & (5100,5550) \mathrm{MeV} \\ & >2 \mathrm{GeVc} \\ & <10 \end{aligned}$ | $\begin{aligned} & (5100,5450) \mathrm{MeV} \\ & - \\ & - \\ & <5 \\ & <25 \end{aligned}$ |

## Results with and withouth s-wave

| Parameter | Result with S-wave | Result without S-wave |
| :---: | :---: | :---: |
| $\left\|A_{\\|}\right\|^{2}$ | $0.252 \pm 0.020$ | $0.253 \pm 0.020$ |
| $\left\|A_{\perp}\right\|^{2}$ | $0.178 \pm 0.022$ | $0.191 \pm 0.019$ |
| $\delta_{\\|}$ | $-2.87 \pm 0.11$ | $-2.82 \pm 0.12$ |
| $\delta_{\perp}$ | $3.02 \pm 0.10$ | $3.07 \pm 0.09$ |
| $\left\|A_{s}\right\|^{2}$ | $0.051 \pm 0.022$ | - |
| $\delta_{s}$ | $2.16 \pm 0.15$ | - |
| $\Gamma_{d}$ | $0.659 \pm 0.015$ | $0.661 \pm 0.015$ |

## Systematics on $\Gamma_{d}$

| signal mass model | 0.004 |
| :---: | :---: |
| signal time model | 0.074 |
| bkg. mass model | 0.039 |
| bkg. time model | 0.012 |
| time resolution model | 0.010 |
| momentum scale | 0.002 |
| decay length scale | 0.002 |
| quadratic sum | 0.082 |
