# SOLAR FLARE ENERGETIC PARTICLES

*Eduard Kontar*

---

*School of Physics and Astronomy  
University of Glasgow, UK*

From Emslie  
et al., 2004

## Flare and Coronal Mass Ejection 23 July 2002

CME Energy  
 $10^{32}$  ergs

Energetic Particles  
 $< 10^{30}$  ergs

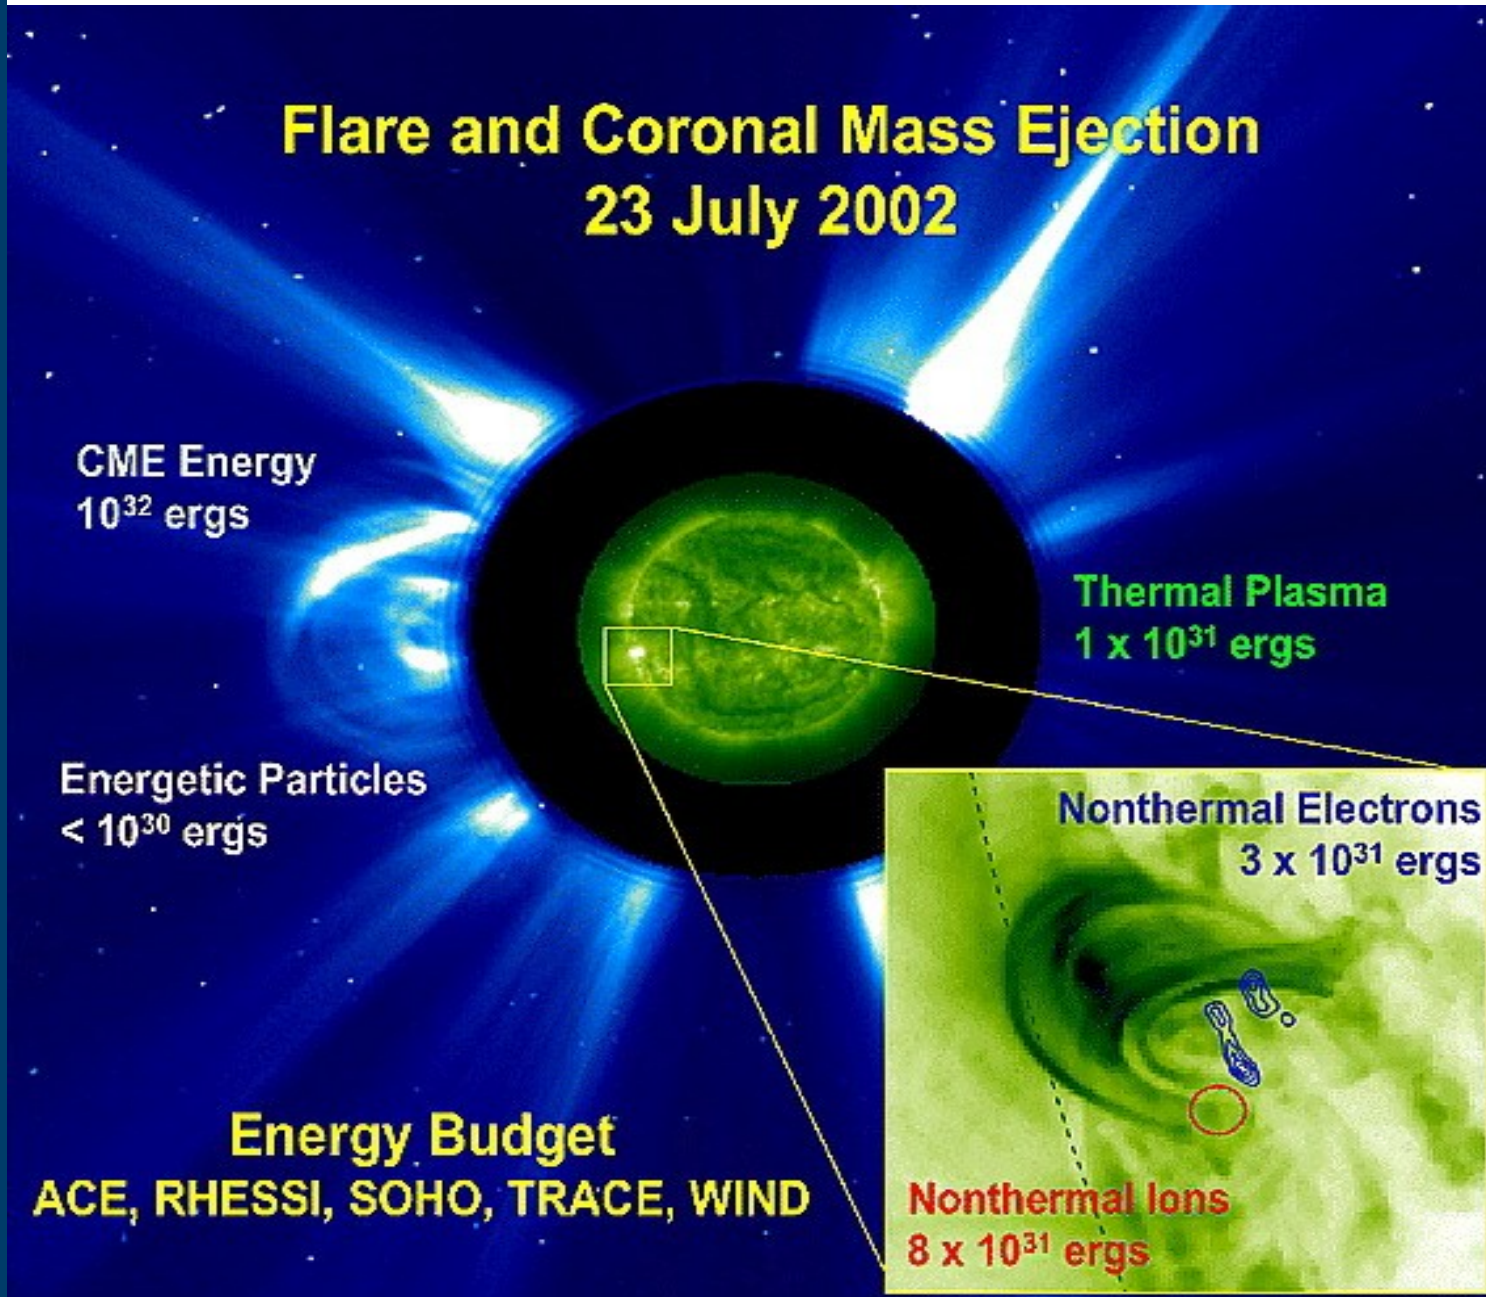

Thermal Plasma  
 $1 \times 10^{31}$  ergs

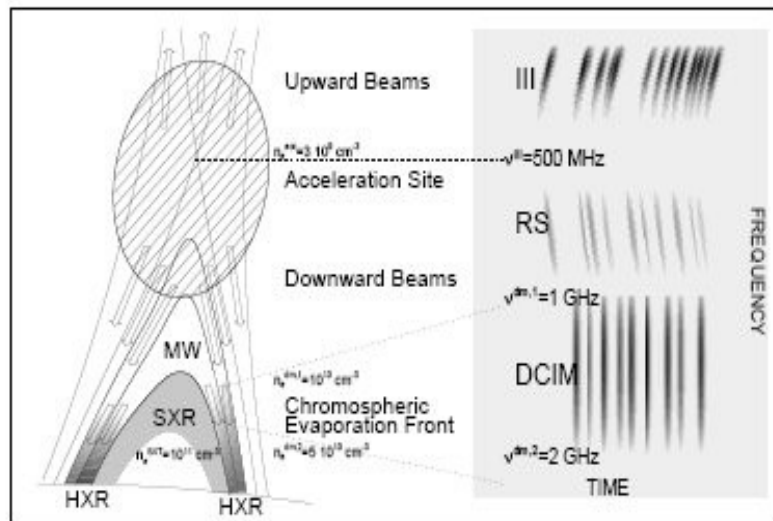

**Energy Budget**  
ACE, RHESSI, SOHO, TRACE, WIND

Nonthermal Electrons  
 $3 \times 10^{31}$  ergs

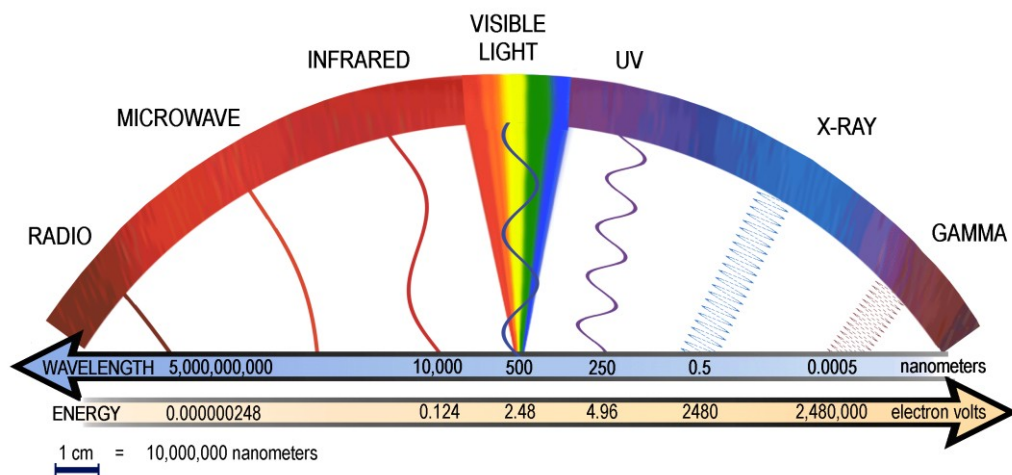

Nonthermal Ions  
 $8 \times 10^{31}$  ergs

Free magnetic  
energy  
 $\sim 2 \times 10^{32}$  ergs

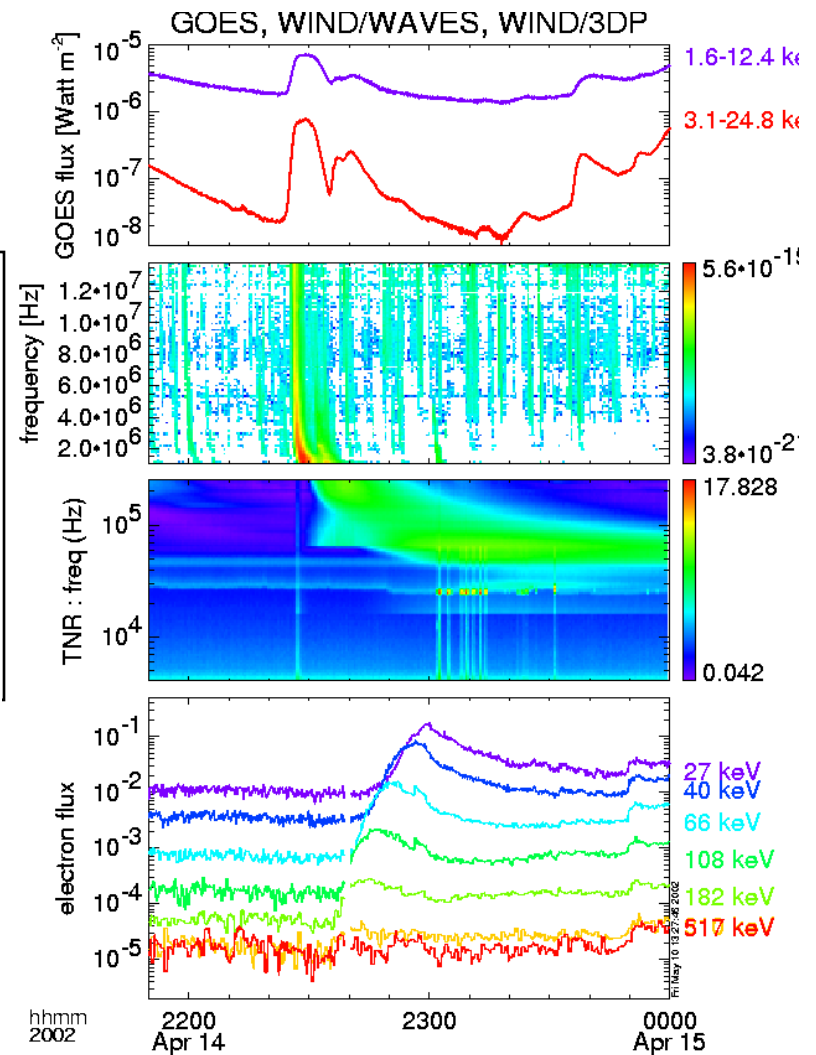

Aschwanden and Benz, 1997

X-rays

radio waves

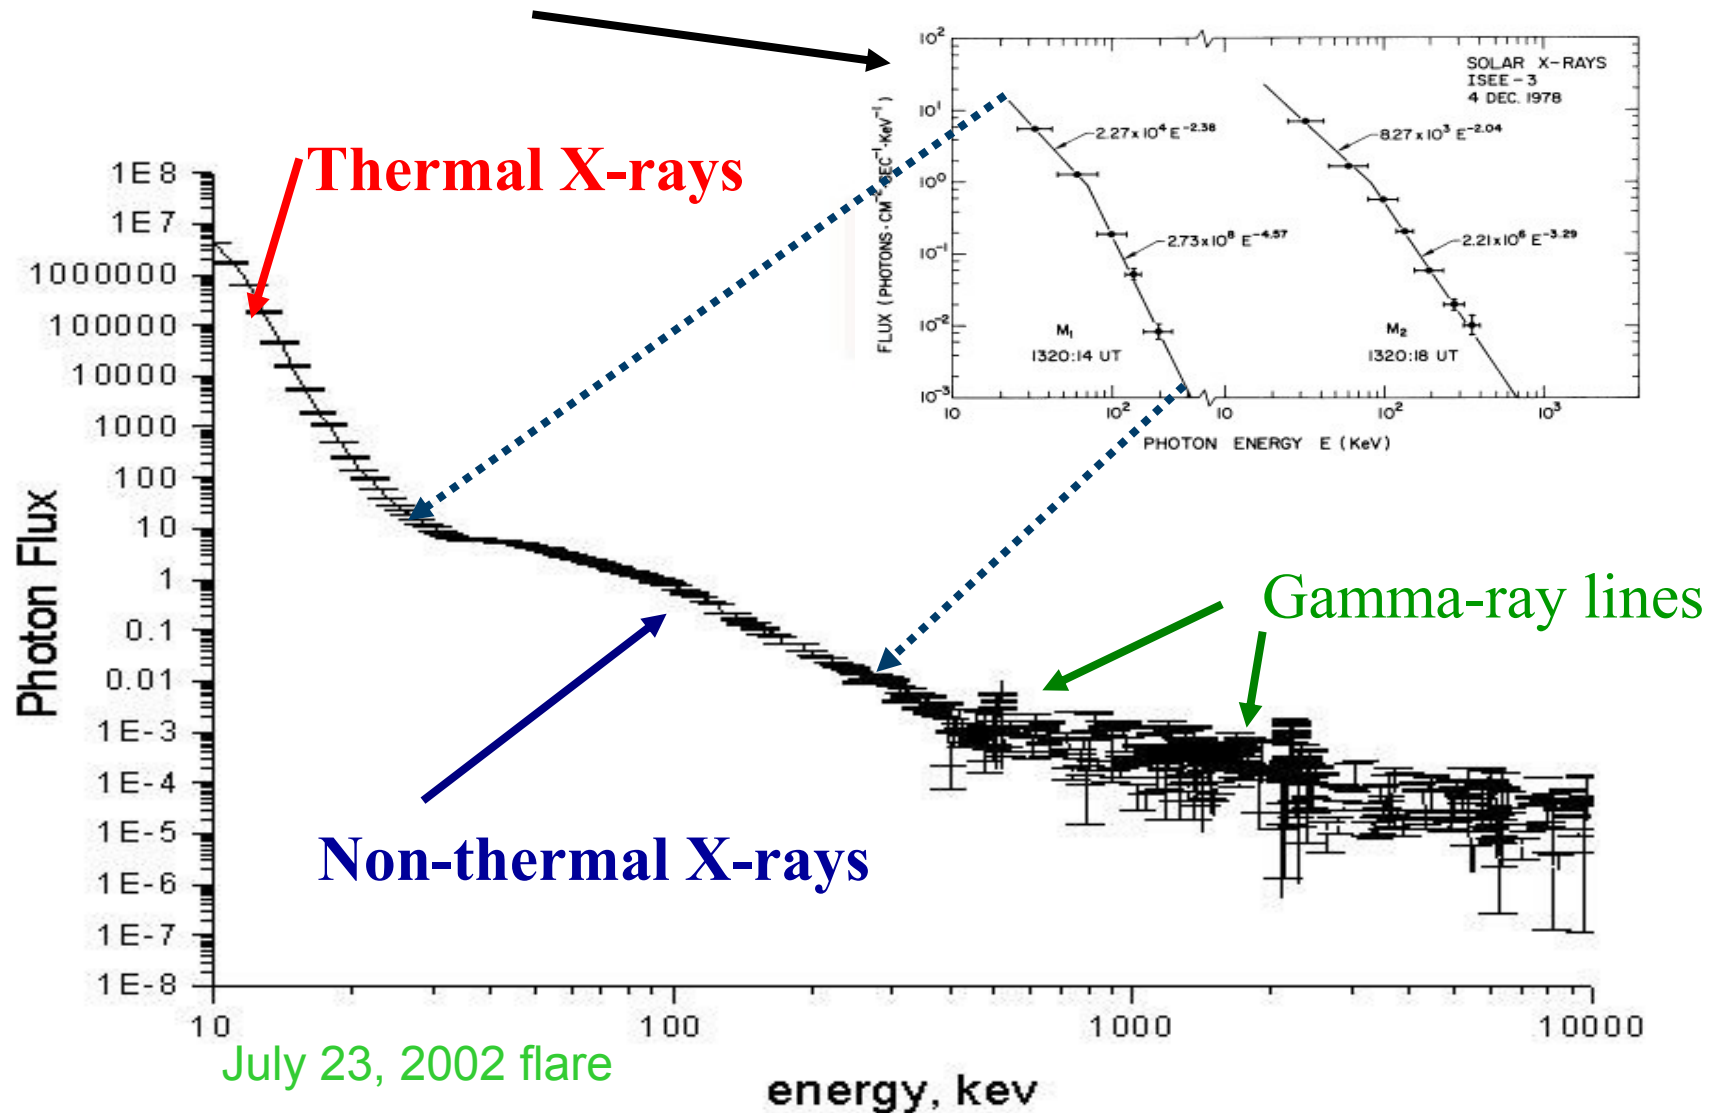

Particles 1AU

Krucker et al, 2001

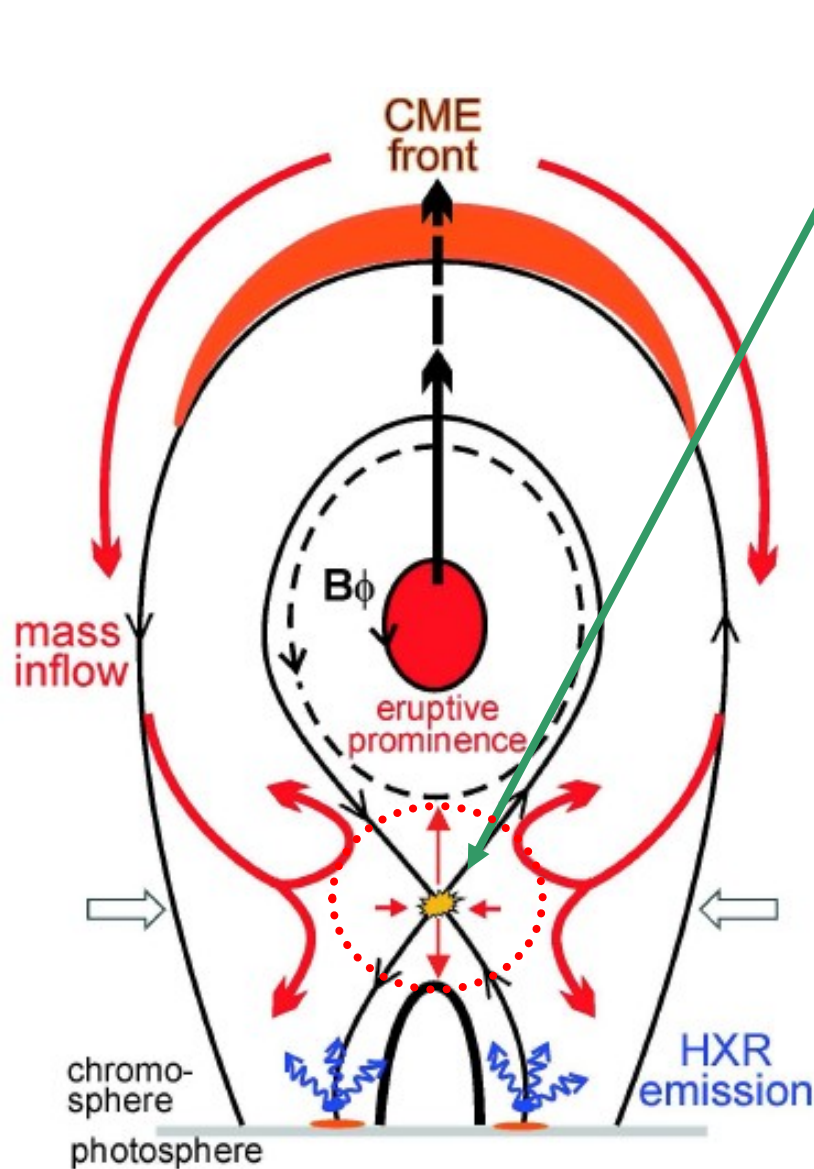

pre-RHESSI X-ray spectra (Kane et al, 1982)

Ramaty High Energy Solar Spectroscopic Imager (RHESSI) spectrum

# “Standard” model of a solar flare/CME

Temmer et al, 2009

**Energy release/acceleration**

**Solar corona**  $T \sim 10^6 \text{ K} \Rightarrow 0.1 \text{ keV per particle}$

**Flaring region**  $T \sim 4 \times 10^7 \text{ K} \Rightarrow 3 \text{ keV per particle}$

**Flare volume**  $10^{27} \text{ cm}^3 \Rightarrow (10^4 \text{ km})^3$

**Plasma density**  $10^{10} \text{ cm}^{-3}$

**Photons up to  $> 100 \text{ MeV}$**

**Number of energetic electrons  $10^{36}$  per second**

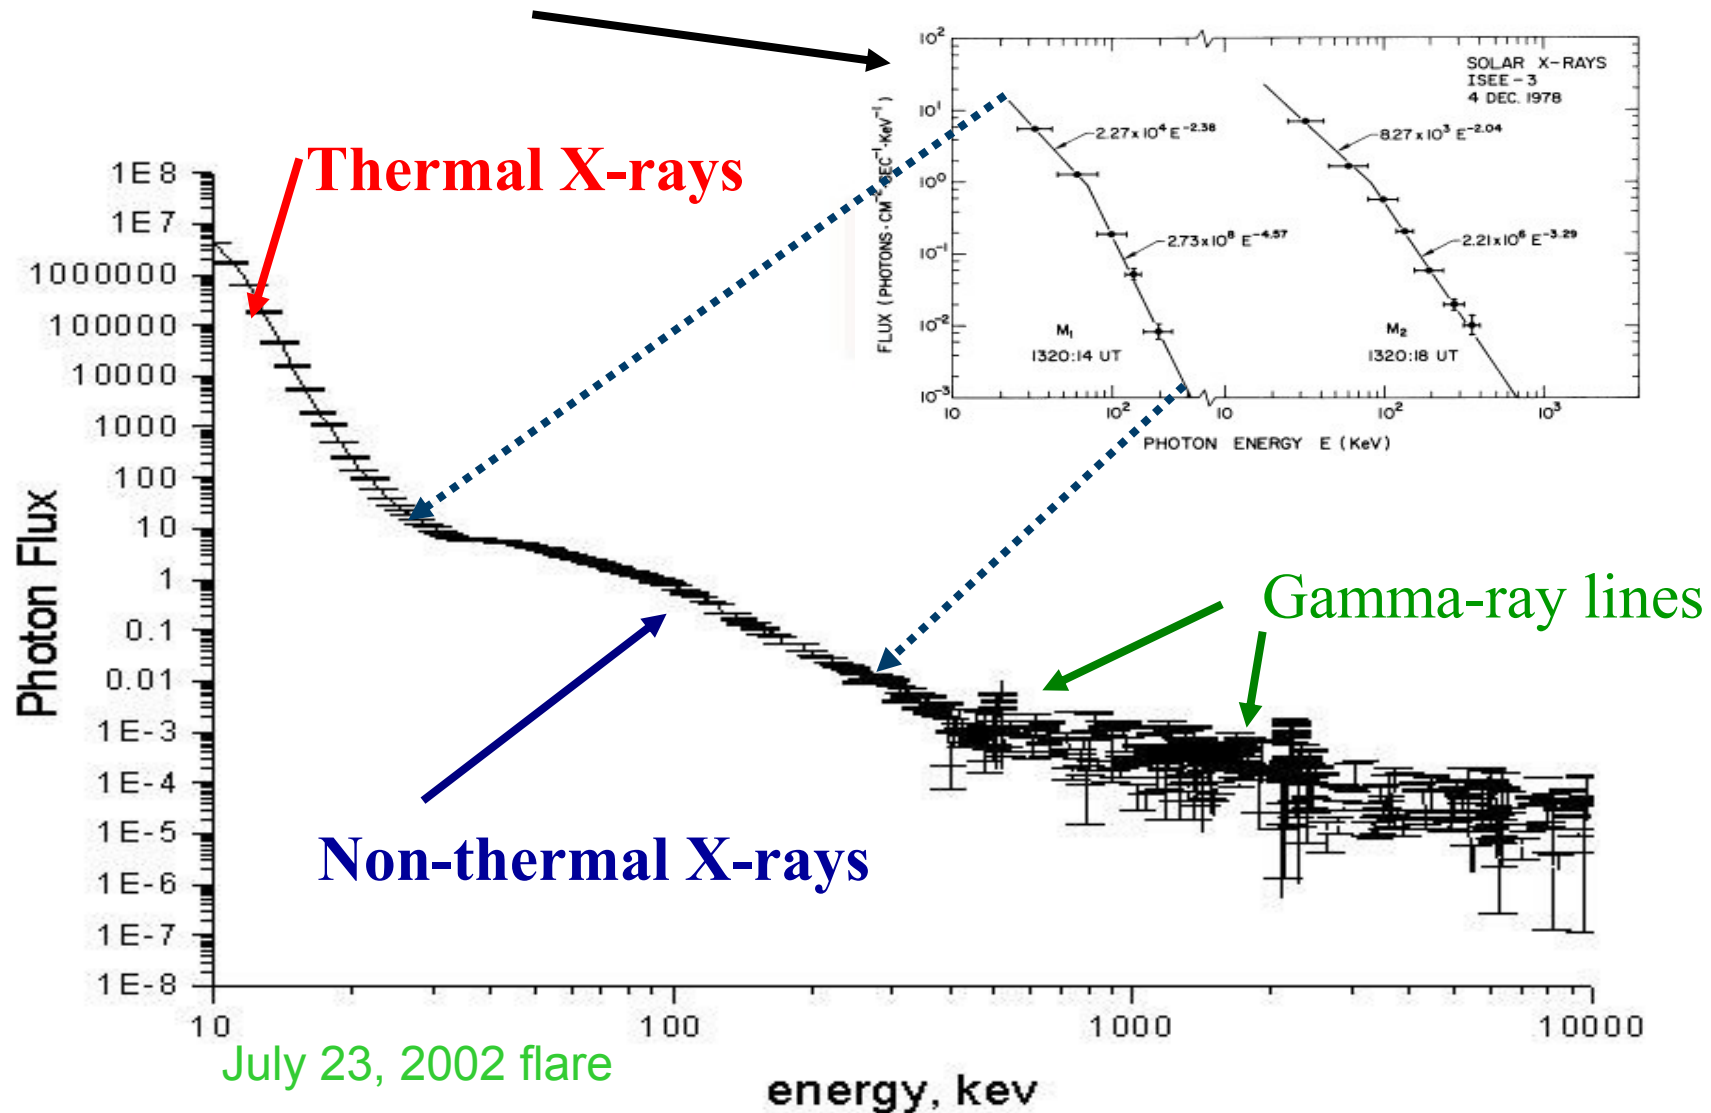

**Electron energies  $> 10 \text{ MeV}$**

**Proton energies  $> 100 \text{ MeV}$**

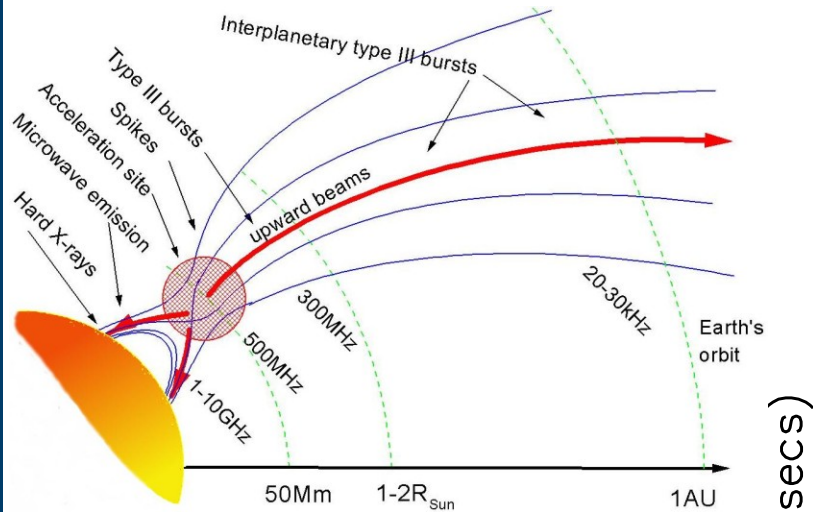

**Large solar flare releases about  $10^{32}$  ergs  
(about half energy in energetic electrons)**

**1 megaton of TNT is equal to about  $4 \times 10^{22}$  ergs.**

pre-RHESSI X-ray spectra (Kane et al, 1982)

Ramaty High Energy Solar Spectroscopic Imager (RHESSI) spectrum

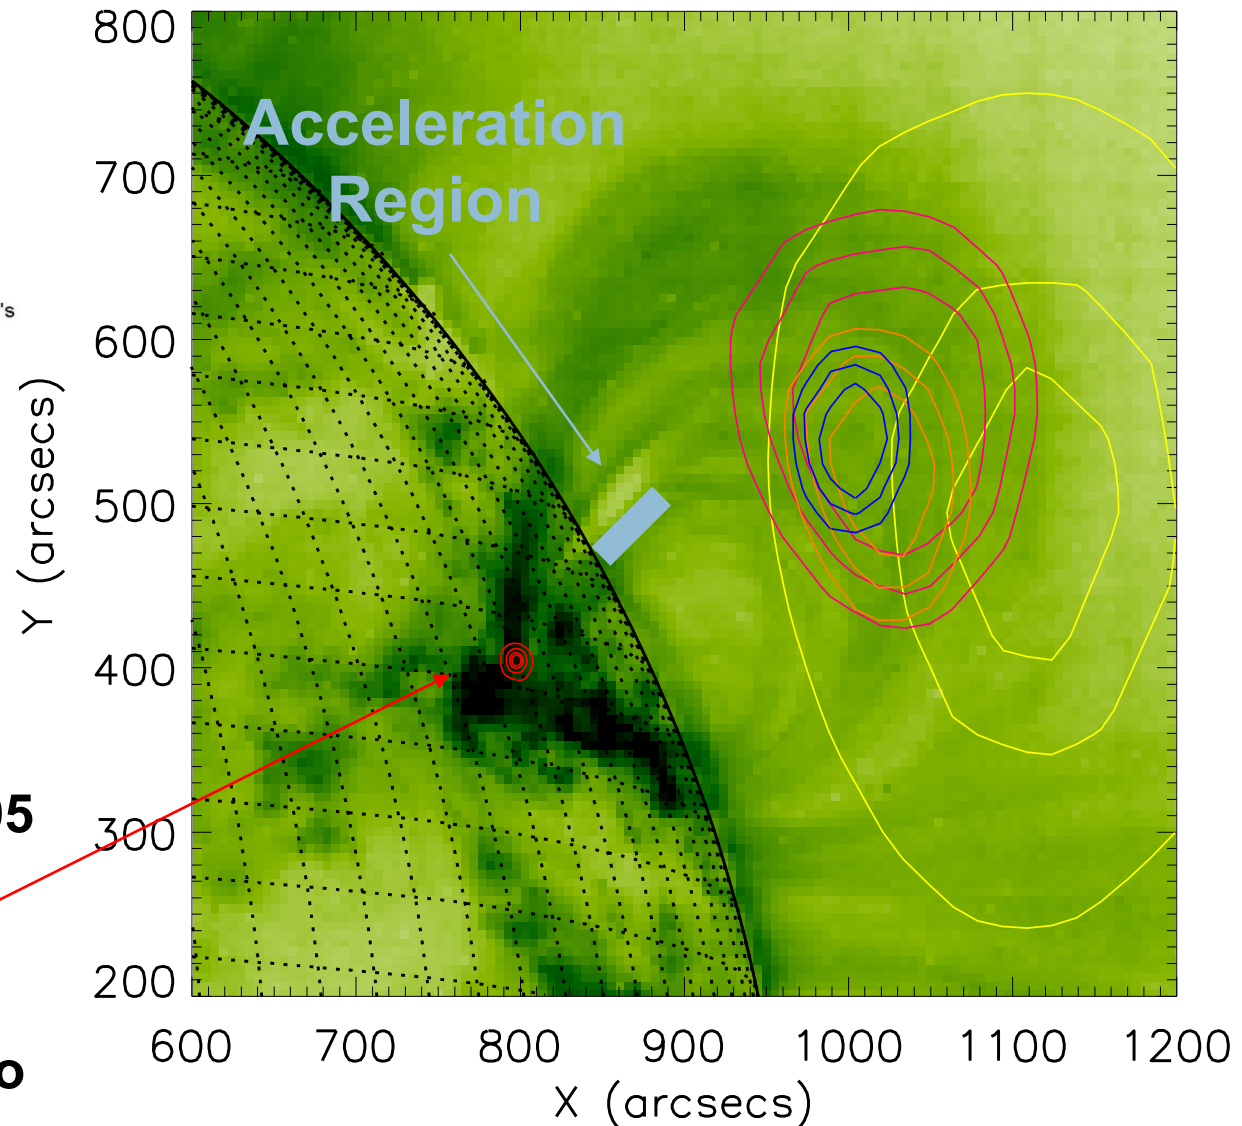

**April 15<sup>th</sup> 2002 Solar Flare.**

**Background is SOHO/EIT 195**

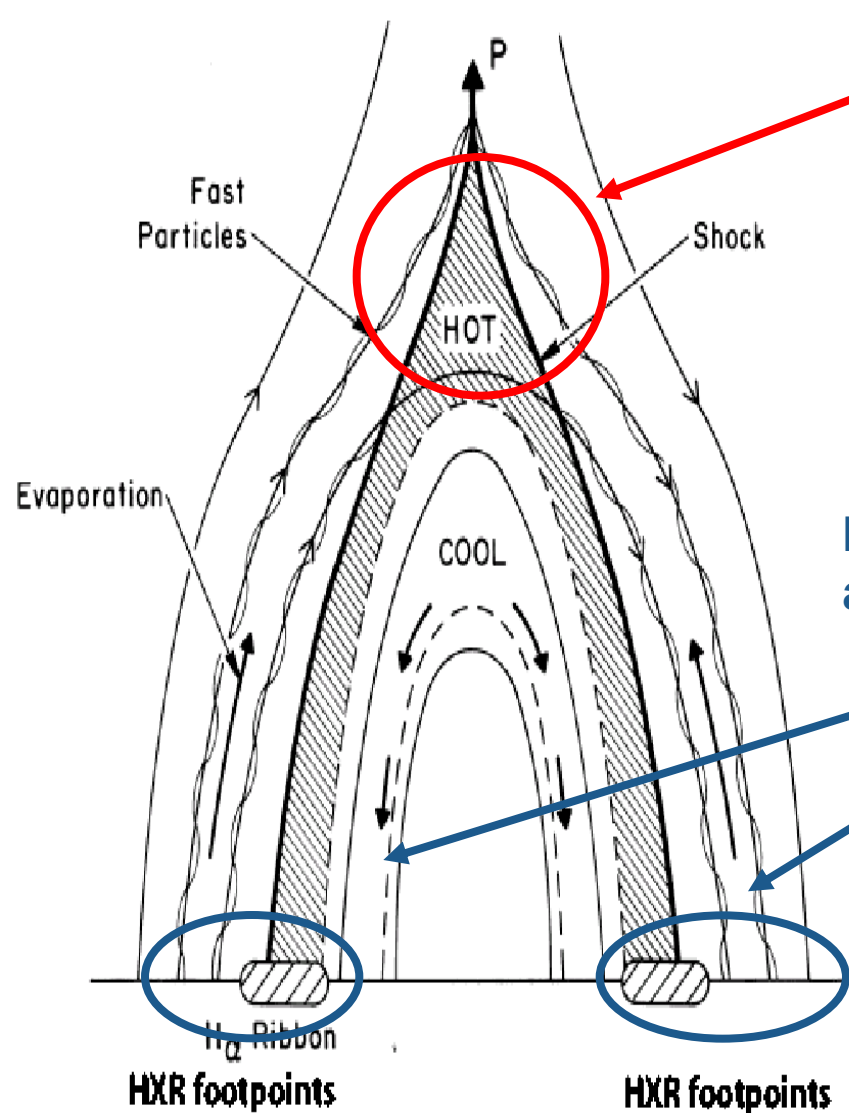

**Small Red contours are  
RHESSI 15-30 keV**

**Coloured Contours are radio  
(NRH) 432 MHz Blue to 164  
MHz Yellow**

SOHO EIT 195, RHESSI, and NRH

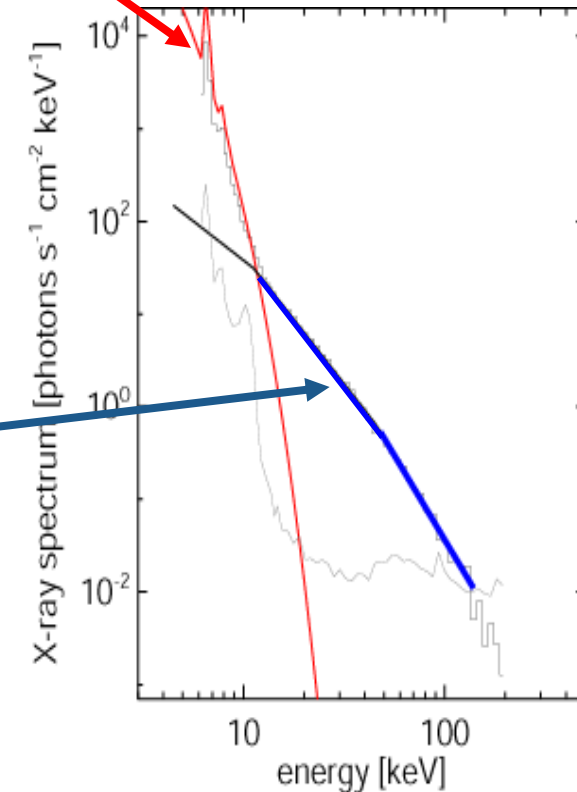

Reid, Vilmer, Kontar, 2011

Soft X-ray emission up to  
~10 - 20 keV

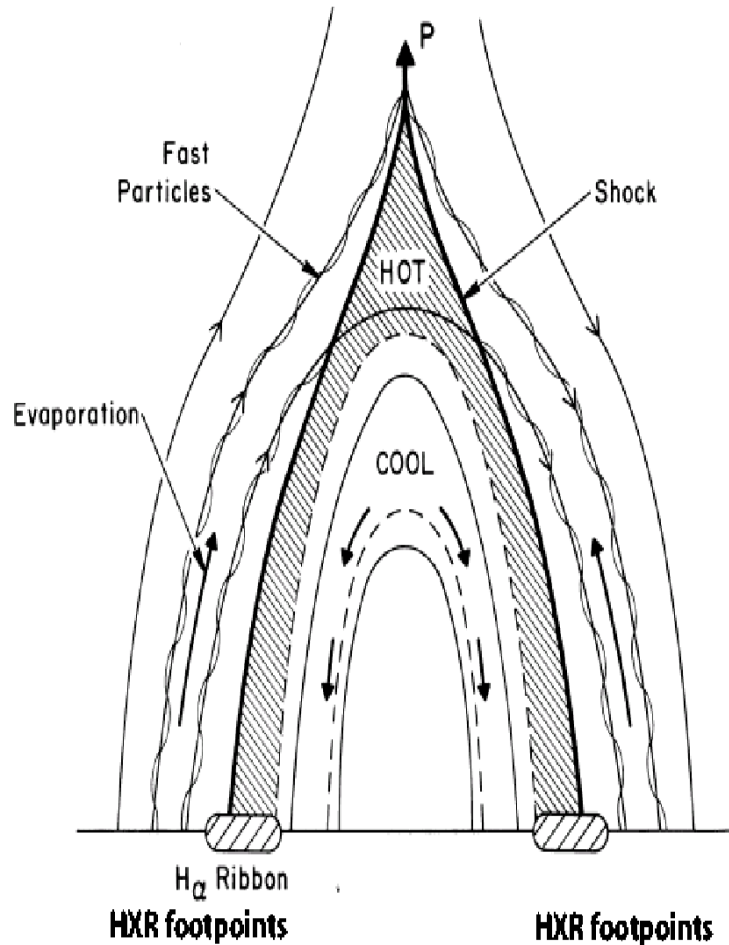

Hard X-ray sources  
above ~20 keV

RHESSI spectrum

'Standard' flare model picture in 2D (Shibata, 1996)

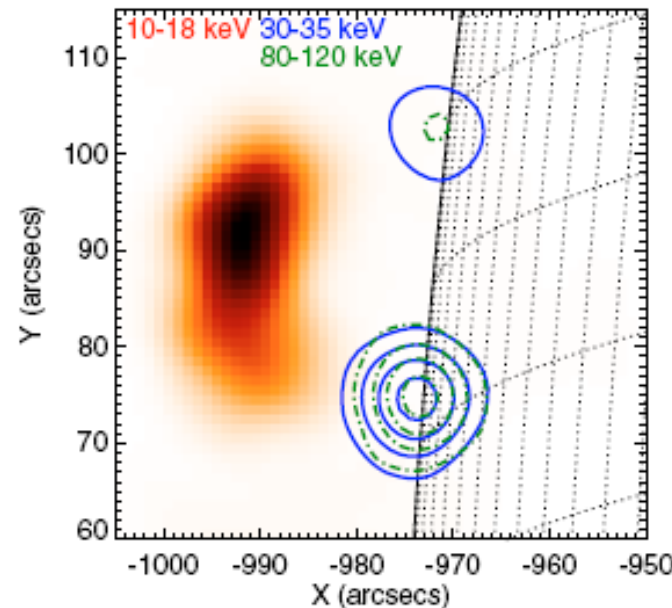

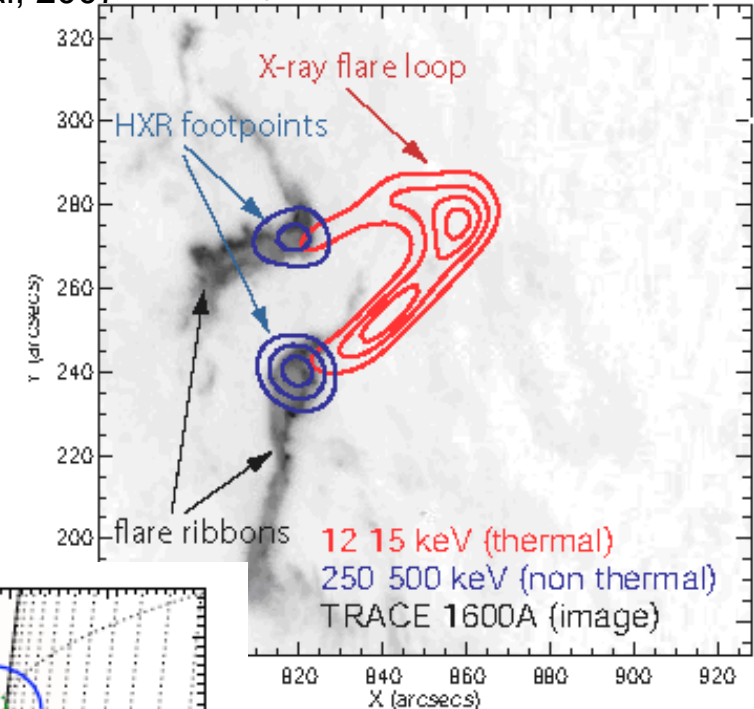

# What do we see in RHESSI?

Standard flare model  
picture (Shibata, 1996)

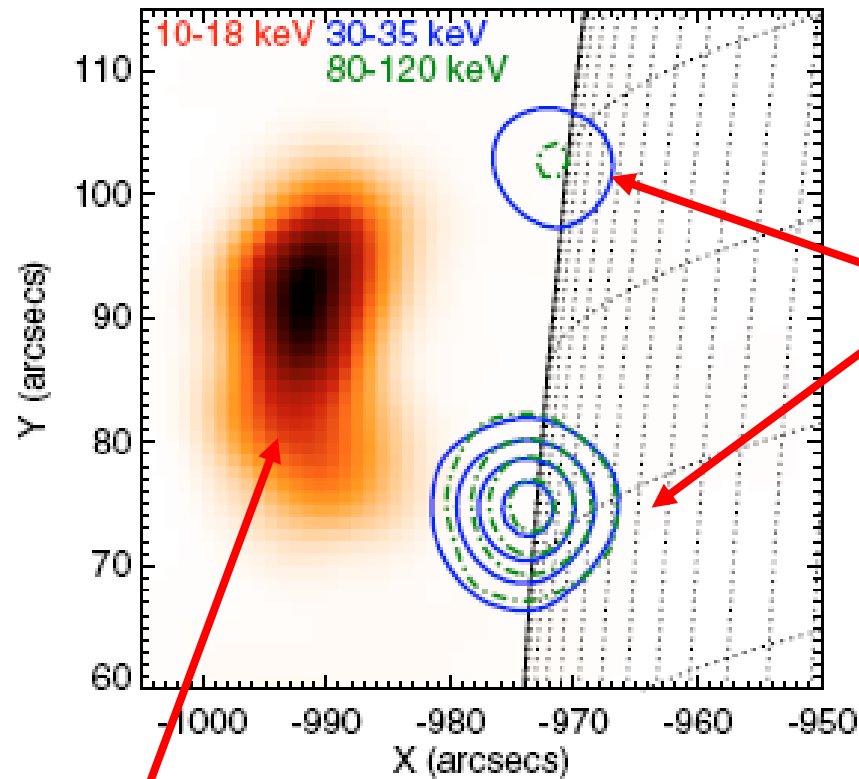

Krucker et al, 2007

HXR peak: 20-Jan-2005 06:45:11 UT

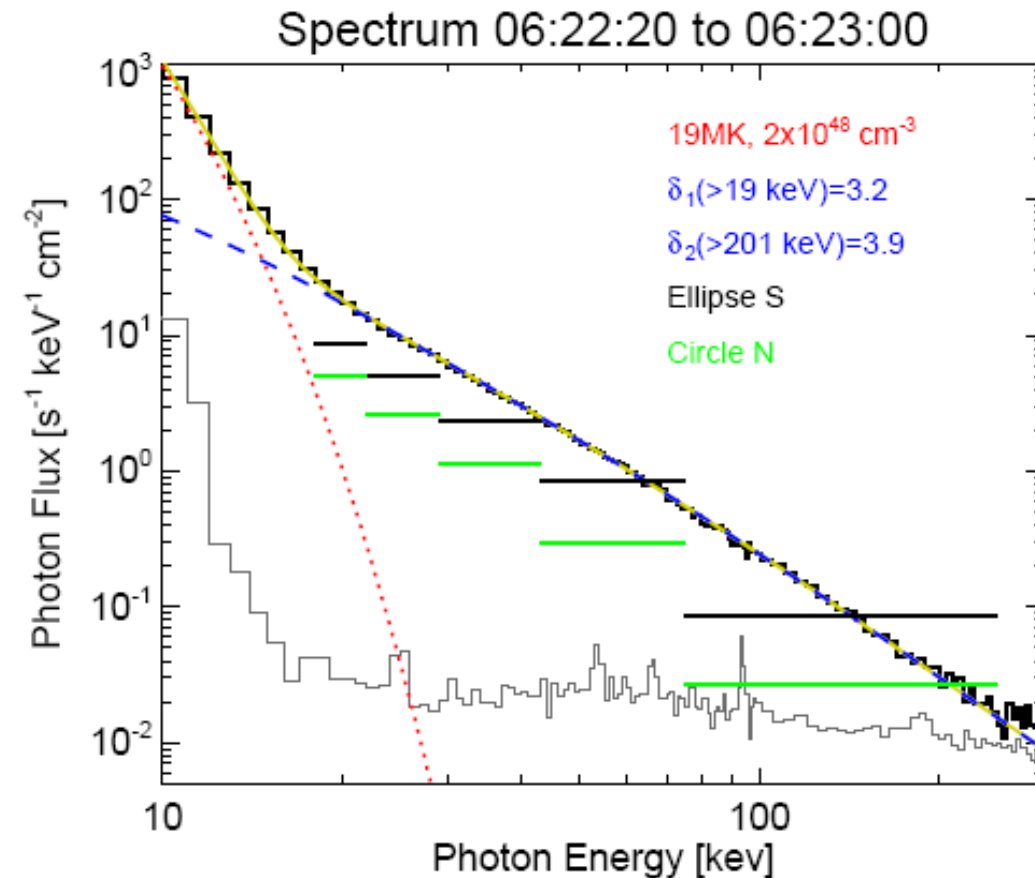

Kontar et al 2008

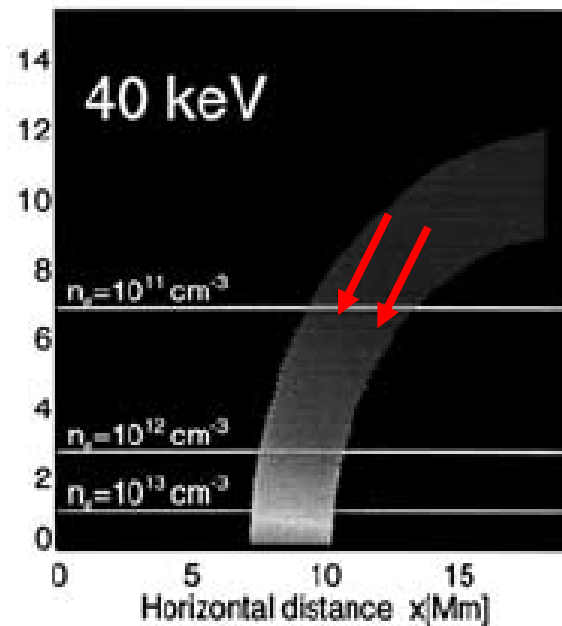

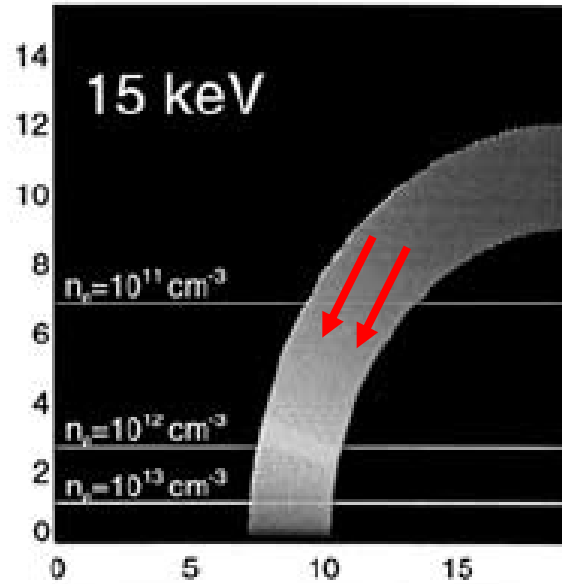

Limb flare event 6 January 2004

Coronal Source

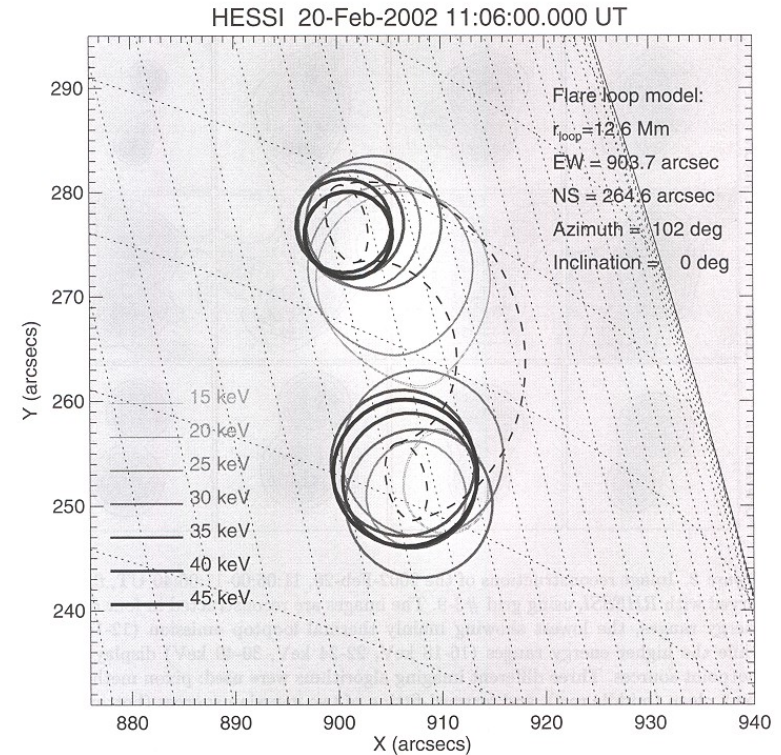

Footpoints

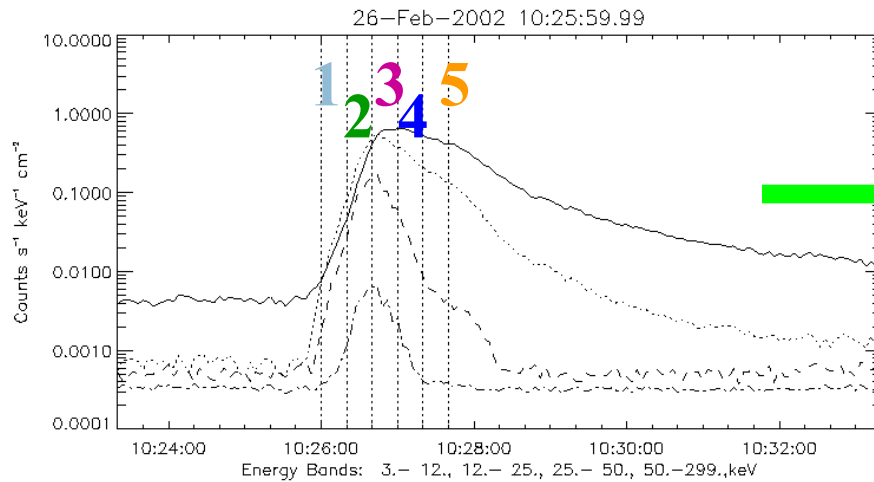

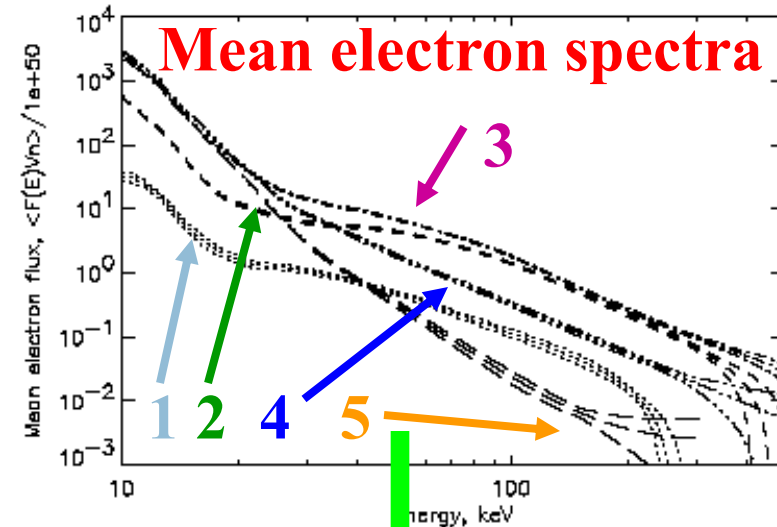

Aschwanden et al, 2002

Higher energy  
sources appear  
lower in the  
chromosphere  
(consistent with  
simple collisional  
transport)

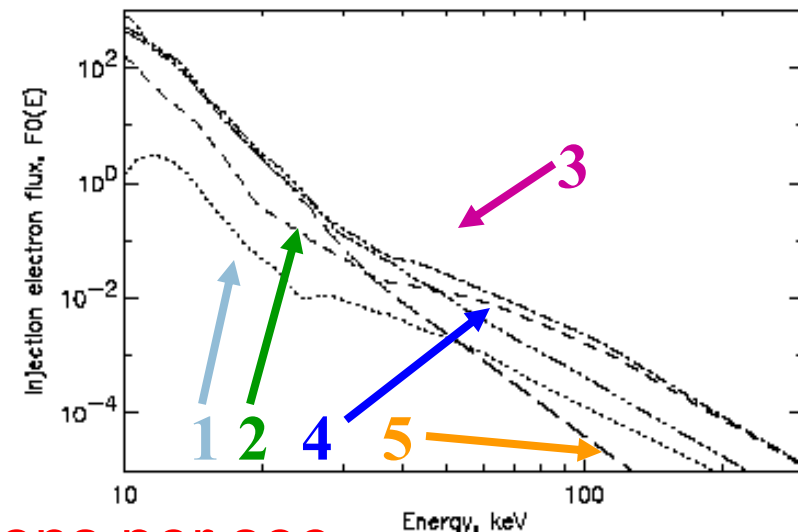

(Model independent)

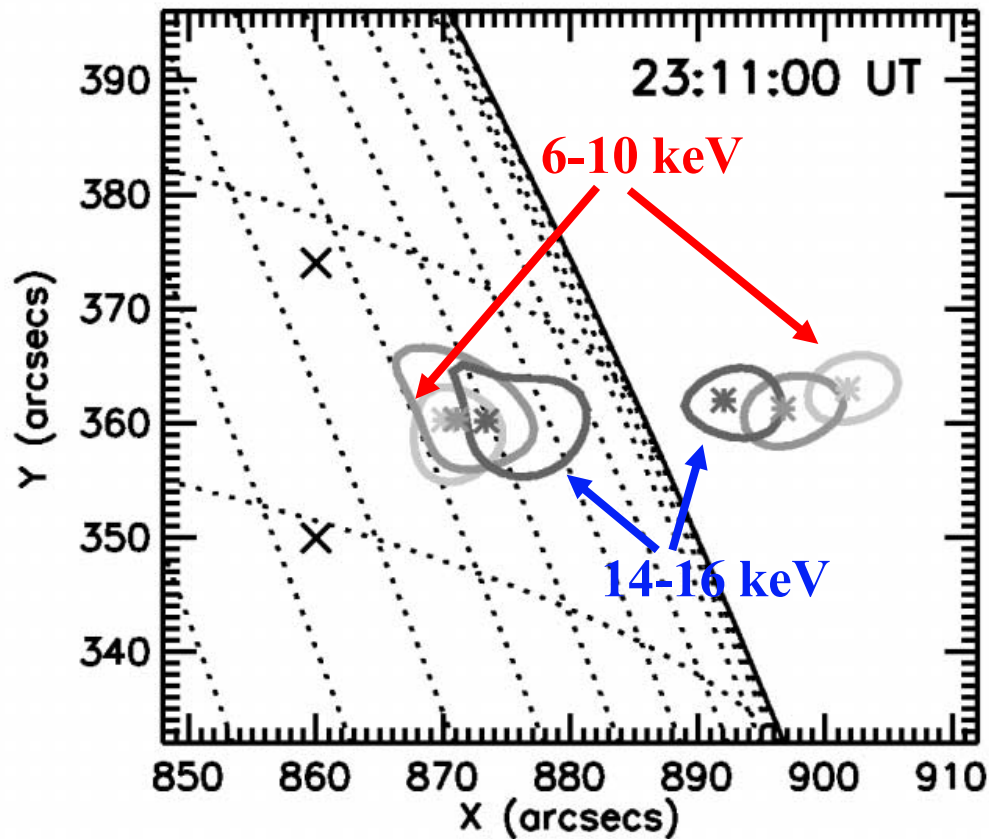

(Model dependent)

## Accelerated (injected) spectra

=> accelerated rate is  $\sim 10^{36}$  electrons per sec

Sui et al, 2004

**Plasma density  $10^{10} \text{ cm}^{-3}$**

**Flare volume  $10^{27} \text{ cm}^3$   
( $10^4 \text{ km}$ )<sup>3</sup>**

**=> Number of electrons:  $10^{37}$**

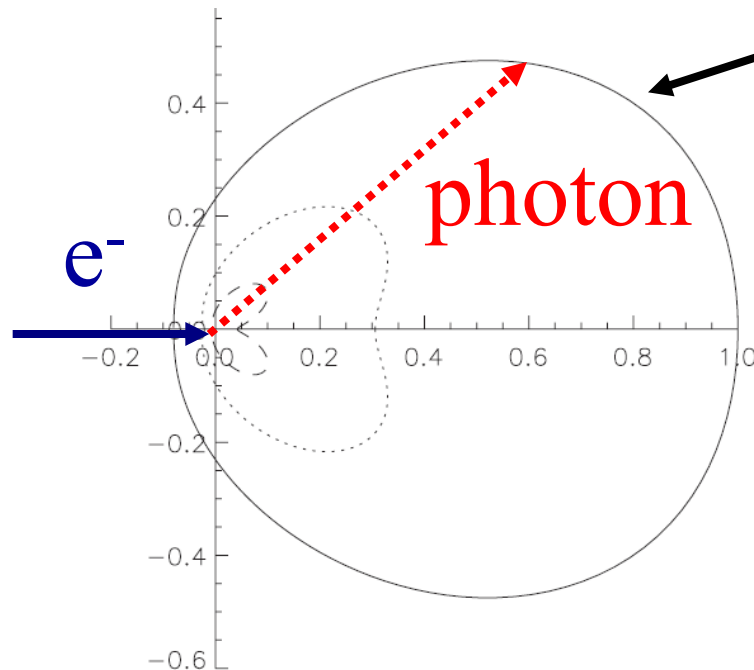

**For acceleration rate  $10^{36}$  per  
second**

**=> All electrons will be evacuated  
from the volume within 10 seconds!**

**Do we observe magnetic reconnection?**

The observed photon flux spectrum at the Earth:

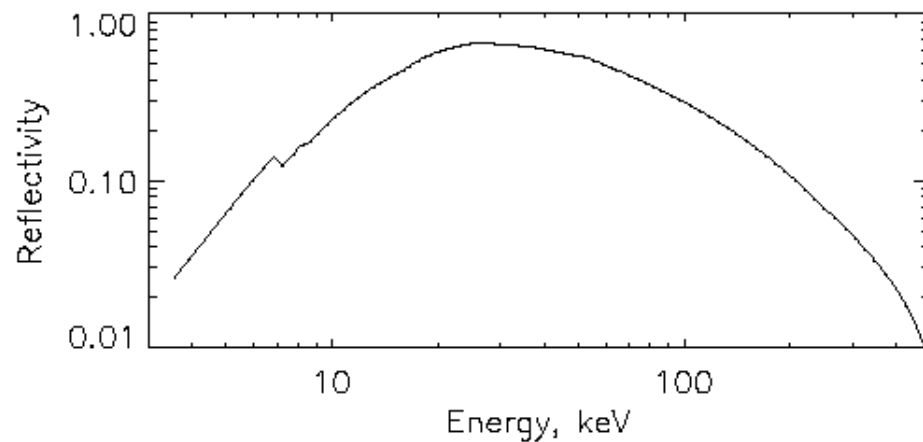

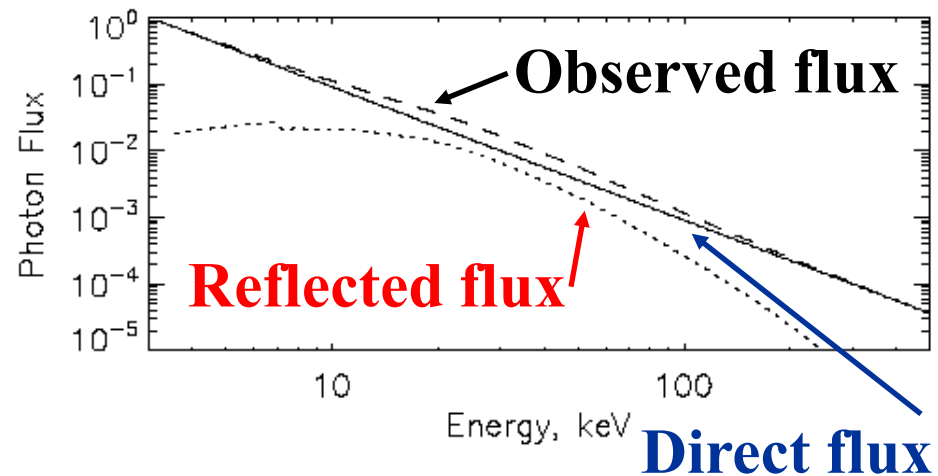

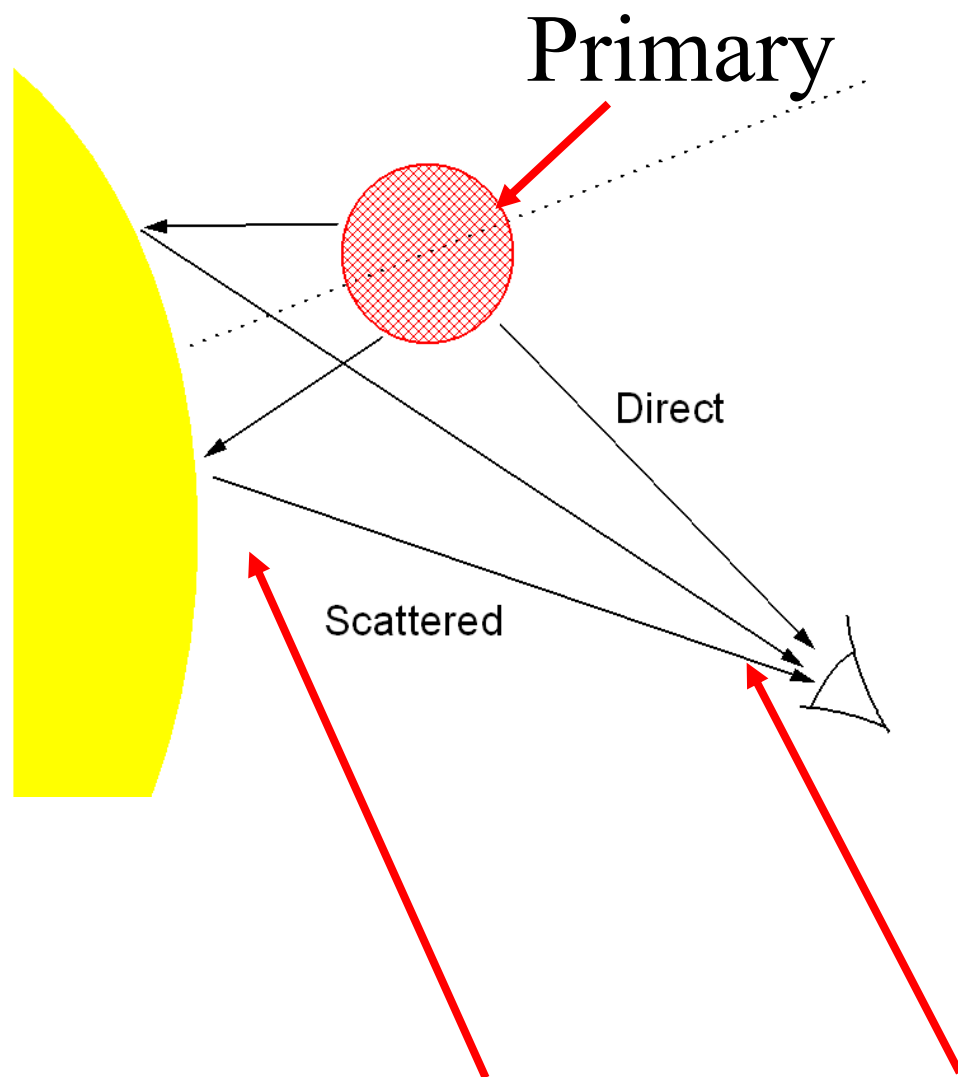

$$I(\epsilon) = \frac{\bar{n}V}{4\pi R^2} \int_{\Omega'} \int_{\epsilon}^{\infty} \bar{F}(E, \Omega') Q(\Omega, \Omega', \epsilon, E) dE d\Omega',$$

Because we observe 1D photon spectrum 3D character of electron distribution is often ignored and  $F(E, \Omega)$  is assumed **isotropic**

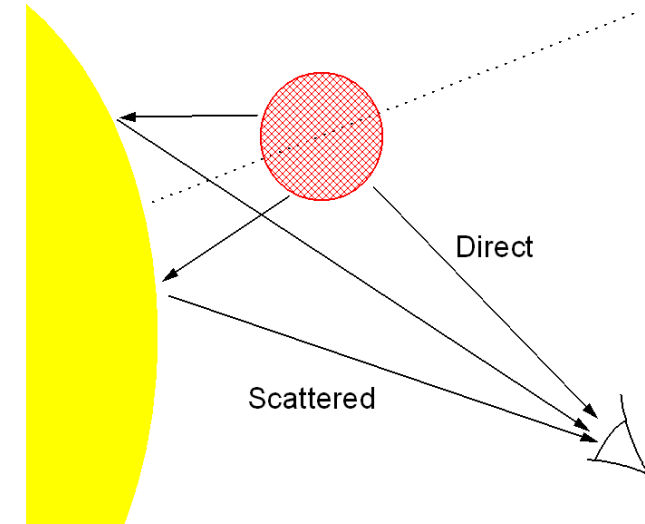

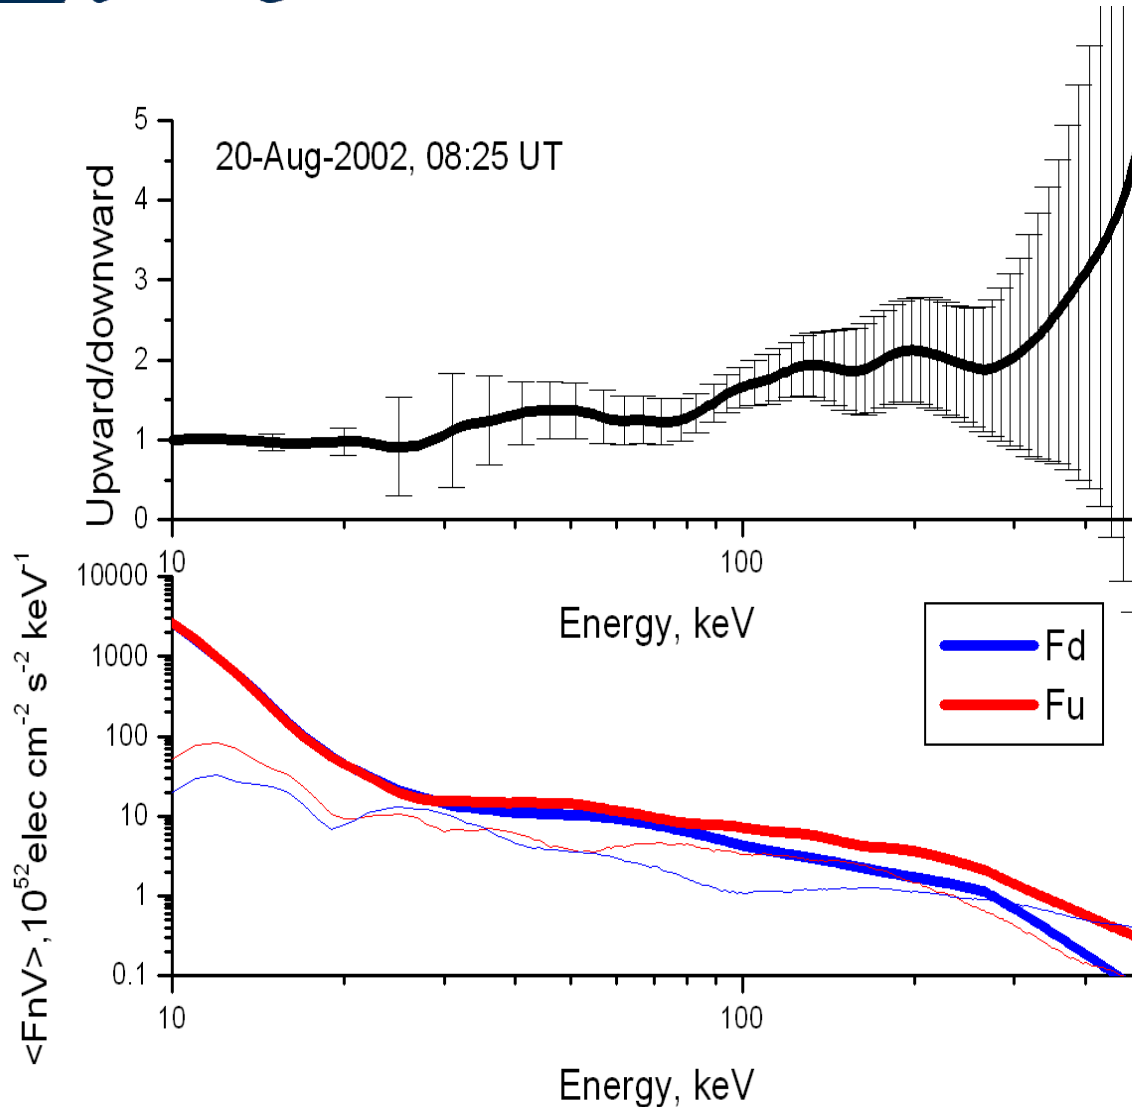

## How to measure electron anisotropy?

- 1) Stereoscopic X-ray observations (*Kane et al, 1982 etc*)
- 2) X-ray polarization (e.g. *McConnell et al (2003);* )
- 3) Centre-to-limb variations in solar flares (*Ohki (1969), Pinter (1969) at 10 keV, Datlowe et al. (1977) etc*)
- 4) Albedo as a probe of electron angular distribution (*Kontar & Brown 2006; Kasparova et al 2007, Battaglia et al, this meeting*)

Reflected

Observed

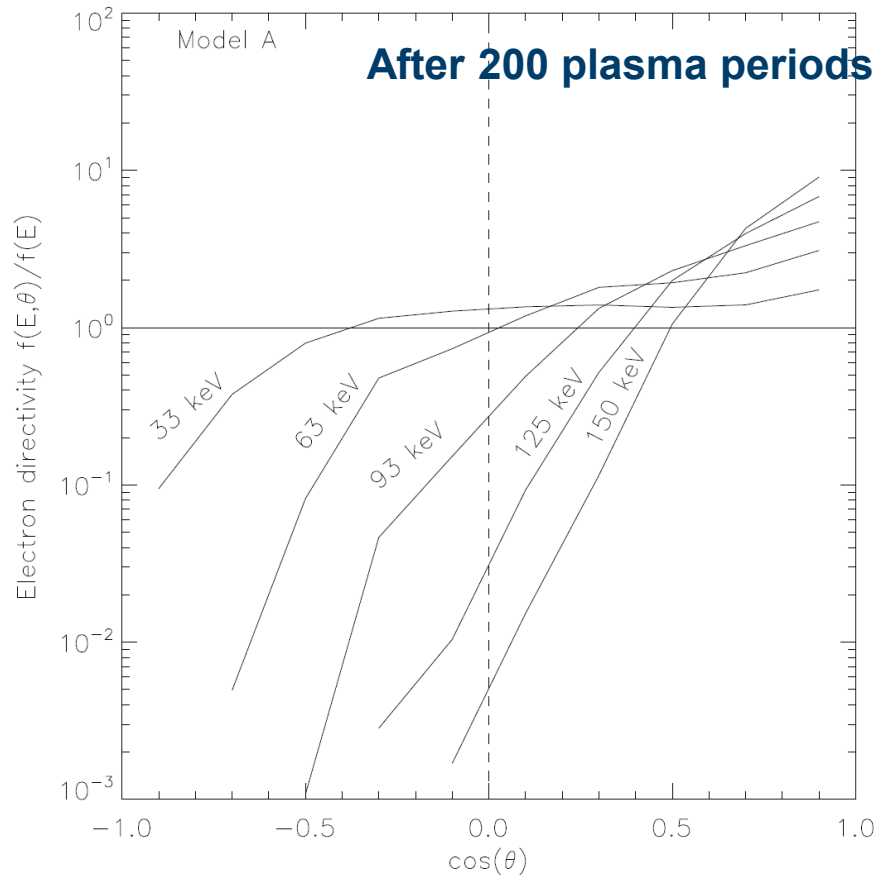

Albedo mirror suggest  
close to isotropic  
distribution (e.g.  
Kontar&Brown, 2006)

Collisional scattering and return  
current effects cannot explain  
the isotropy of electron  
distribution

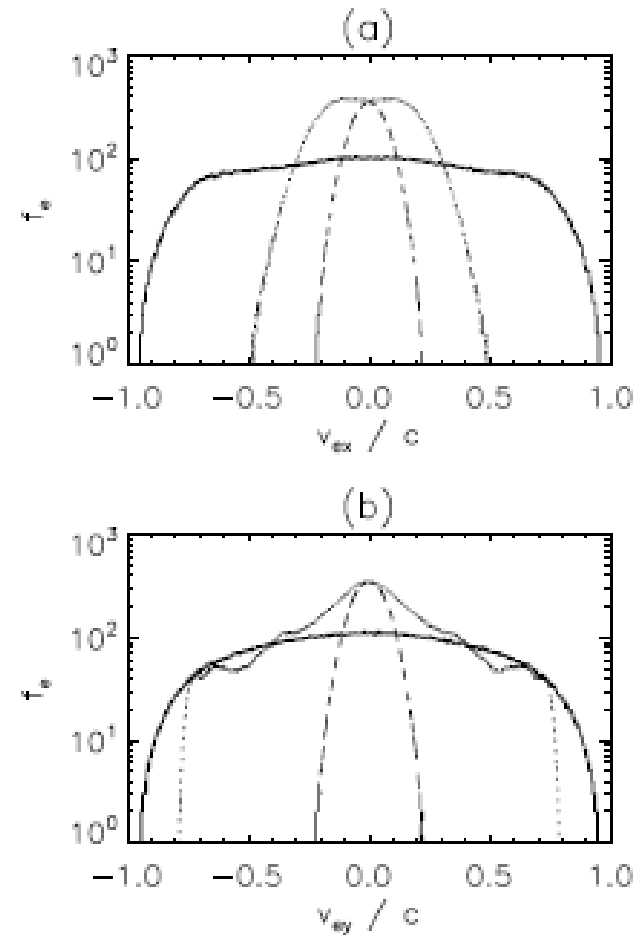

=> The angular distribution found is **inconsistent with downward beamed distributions**

Collective effects of beam-plasma interaction?

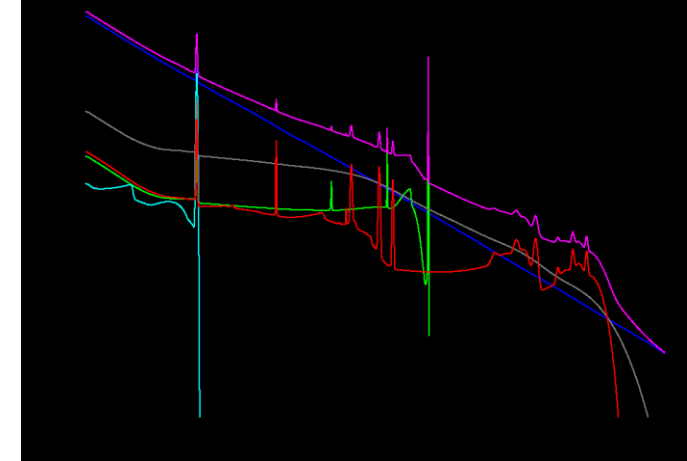

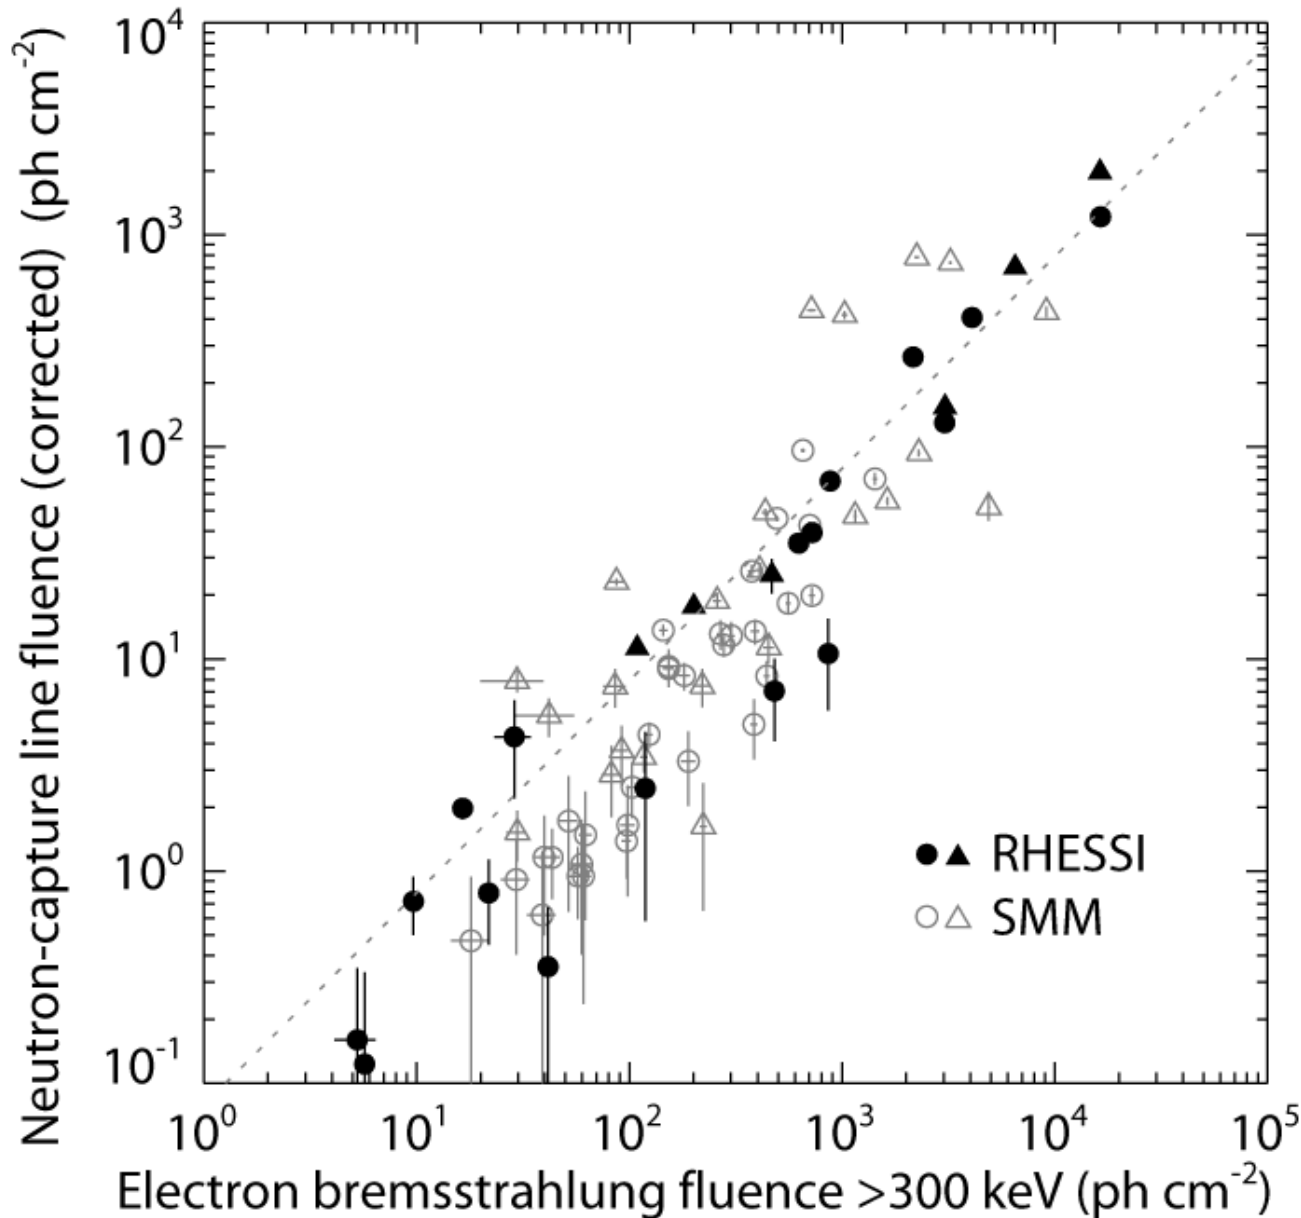

Related to the properties of accelerated electrons?

PIC simulations of electron transport  
(Karlicky & Kasparova, 2009)

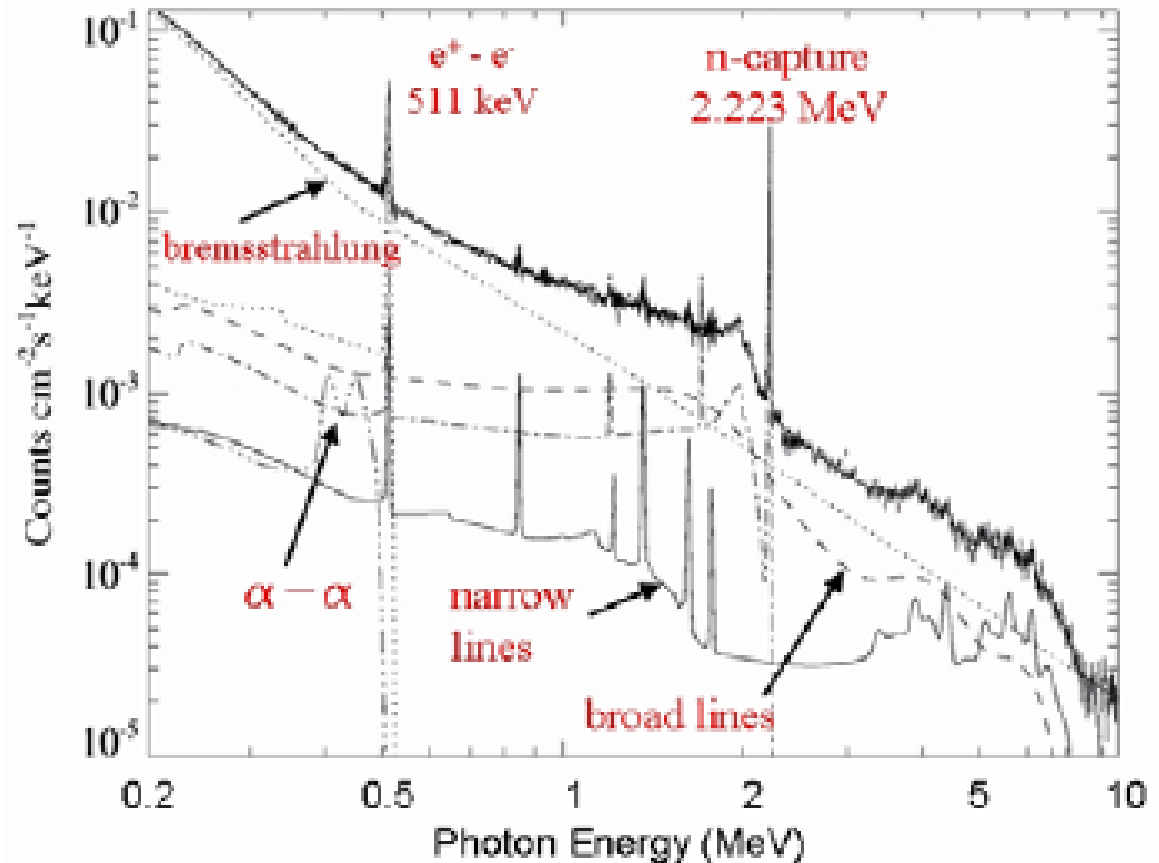

X-point collapse was studied using  
kinetic, 2.5-dimensional, PIC code  
(Tsiklauri and Haruki, 2008)

Ion acceleration  $>30 \text{ MeV}$   
 is correlated with  
 relativistic electron  
 acceleration  $>300 \text{ keV}$

Ion acceleration  $>30 \text{ MeV}$   
 is poorly correlated with  
 electron acceleration  $>50 \text{ keV}$ , with the possibility of  
 two separate classes of flares  
 (Shih et al, 2009)

From Murphy and Share, 2004

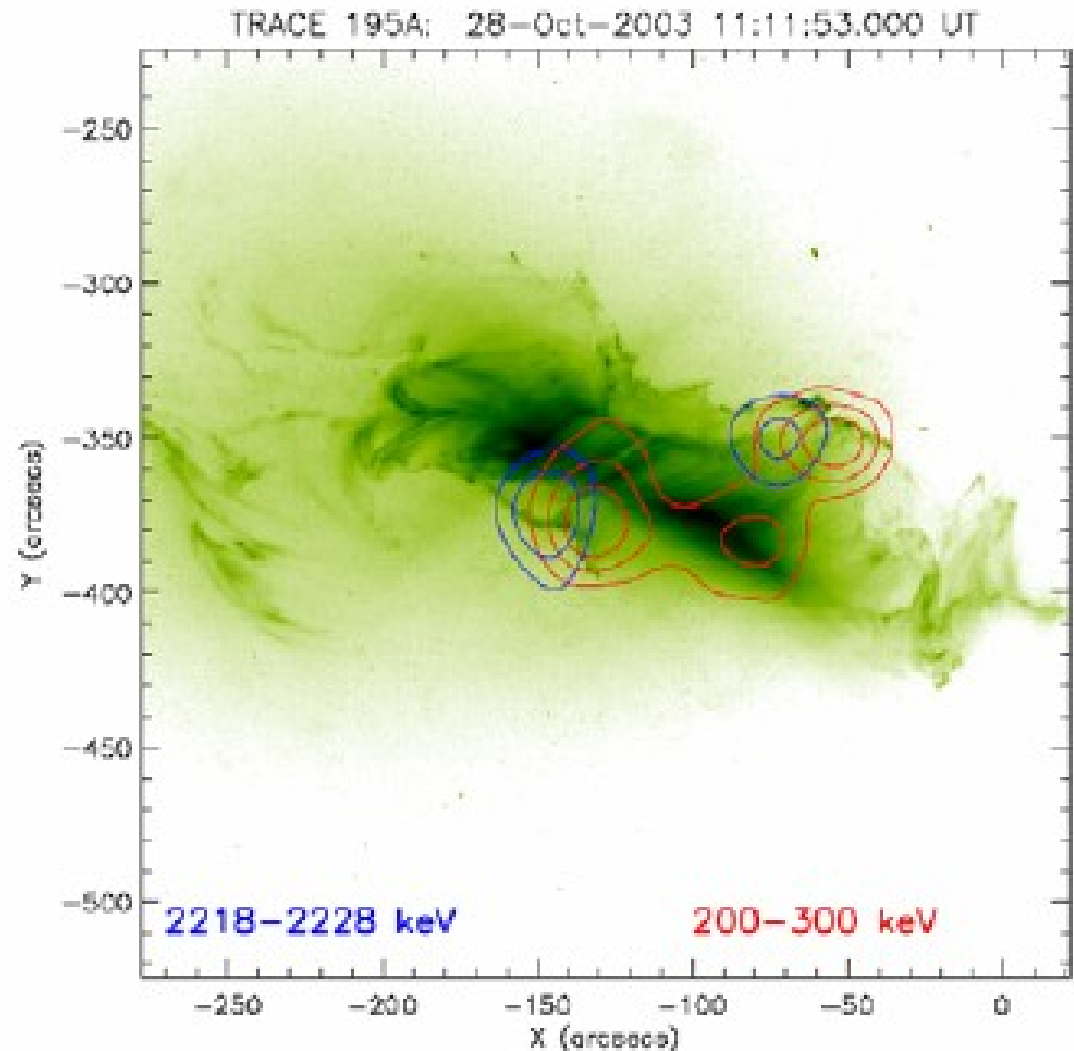

### a) narrow-gamma lines

Accelerated protons and alpha particles

### b) broad-gamma lines and gamma-ray-continuum

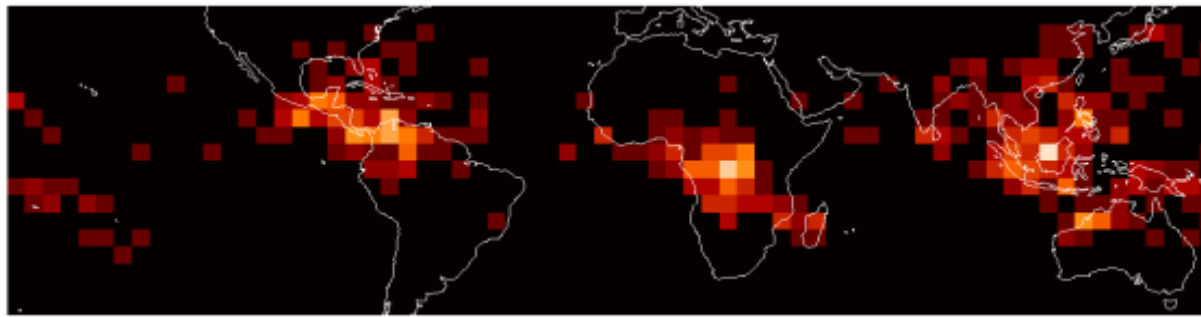

Accelerated heavy ions and unresolved lines and Compton scattering

Imaging of the 2.223 MeV neutroncapture line (blue contours) and the HXR electron bremsstrahlung (red contours) of the flare on October 28, 2003. The underlying image is from TRACE at 195 Å. The X-ray and  $\gamma$ -ray imaging shown here used exactly the same selection of detector arrays and imaging procedure. Note the apparent loop-top source in the hard X-ray contours. (Hurford et al, 2006)

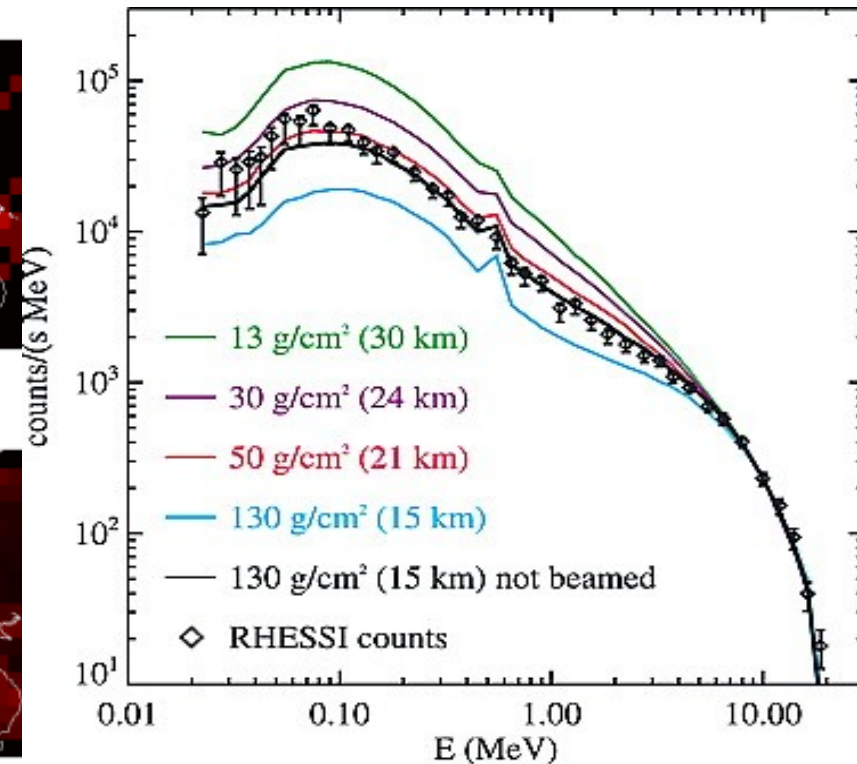

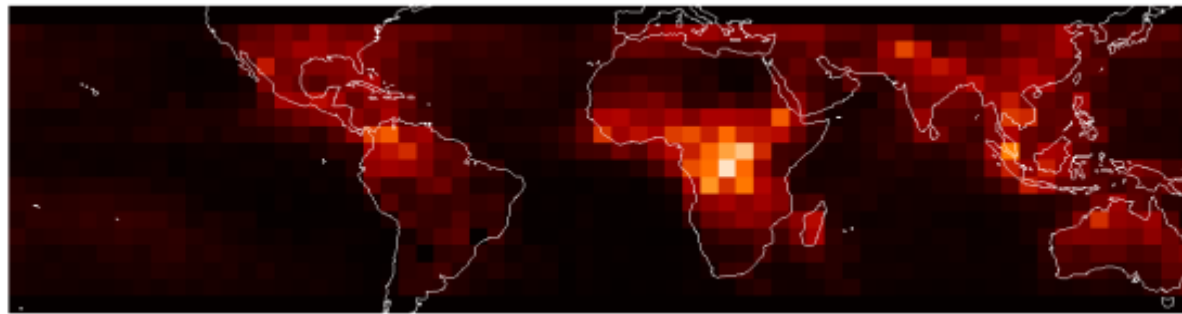

# Instead of conclusions...

## RHESSI Terrestrial Gamma-ray Flashes Positions

## Visible Lightning Positions

Terrestrial gamma-ray flashes (TGFs) are very brief bursts of gamma radiation (typically around 1 millisecond long) coming upwards from the Earth's atmosphere from somewhere in the vicinity of a thunderstorm (Smith et al, 2005)
