Motivación:

Imaginemos que vais a una clase de pintura y os encontráis esto:

o que en clase de
matemáticas
no hay nada más que cosas
como esta:

$$\sqrt{6.42.53}$$

$$\underline{-4}$$

$$242$$

$$\underline{-225}$$

$$01753$$

$$\underline{-1509}$$

$$0244$$

$$253$$

$$2 \times 2 = 4$$

$$45 \times 5 = 225$$

$$503 \times 3 = 1509$$

o en física...

(Received 12 November 1974)

We report the observation of a heavy particle J , with mass $m = 3.1$ GeV and width approximately zero. The observation was made from the reaction $p + \text{Be} \rightarrow e^+ + e^- + x$ by measuring the e^+e^- mass spectrum with a precise pair spectrometer at the Brookhaven National Laboratory's 30-GeV alternating-gradient synchrotron.

This experiment is part of a large program to study the behavior of timelike photons in $p + p \rightarrow e^+ + e^- + x$ reactions¹ and to search for new particles which decay into e^+e^- and $\mu^+\mu^-$ pairs.

daily with a thin Al foil. The beam spot size is 3×6 mm², and is monitored with closed-circuit television. Figure 1(a) shows the simplified side view of one arm of the spectrometer. The two

FIG. 2. Mass spectrum showing the existence of J . Results from two spectrometer settings are plotted showing that the peak is independent of spectrometer currents. The run at reduced current was taken two months later than the normal run.

La revolución de noviembre en la física de partículas

With the discovery of the J/Psi particle, we realized that many diverse strands of research were converging on a single theory of physics.

El modelo estándar

S. Glashow:

In 1969, John Iliopoulos and Luciano Maiani came to Harvard as research fellows. Together, we found the arguments that predicted the existence of charmed hadrons. Much of my later work was done in collaboration with Alvaro de Rujúla or Howard Georgi.

In early 1974, we predicted that charm would be discovered in neutrino physics or in $e^+ e^-$ annihilation. So it was.

With the discovery of the J/Psi particle, we realized that **many diverse strands of research were converging on a single theory of physics.**

(Received 27 November 1974)

We argue that the newly discovered narrow resonance at 3.1 GeV is a 3S_1 bound state of charmed quarks and we show the consistency of this interpretation with known meson systematics. The crucial test of this notion is the existence of charmed hadrons near 2 GeV.

A surprisingly narrow resonance at $M = 3.1$ GeV was discovered in $p + \text{Be} \rightarrow e^+ + e^- + \dots$ ¹ and in e^+e^- annihilation.² Estimates³ of its decay

variant. It contributes to the singlet mass. We suggest that the remaining term is just the sum of the quark masses plus a common additive con-
