Take a Lie group G and its associated Lie algebra \mathfrak{g} and a spacetime manifold M. Consider a \mathfrak{g} -valued spacetime 2-form B and a G-connection A, and construct the action

$$S = rac{1}{2} \int_M d^4 x \operatorname{Tr}(B \wedge F),$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

where $F = dA + \frac{1}{2}A \wedge A$ is the curvature of A.

Take a Lie group G and its associated Lie algebra \mathfrak{g} and a spacetime manifold M. Consider a \mathfrak{g} -valued spacetime 2-form B and a G-connection A, and construct the action

$$S = rac{1}{2} \int_M d^4 x \operatorname{Tr}(B \wedge F),$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

where $F = dA + \frac{1}{2}A \wedge A$ is the curvature of A.

Some notable features:

Take a Lie group G and its associated Lie algebra \mathfrak{g} and a spacetime manifold M. Consider a \mathfrak{g} -valued spacetime 2-form B and a G-connection A, and construct the action

$$S = rac{1}{2} \int_M d^4 x \operatorname{Tr}(B \wedge F),$$

where $F = dA + \frac{1}{2}A \wedge A$ is the curvature of A.

Some notable features:

Equation of motion for B implies F = 0, i.e. A is flat – the theory is topological.

Take a Lie group G and its associated Lie algebra \mathfrak{g} and a spacetime manifold M. Consider a \mathfrak{g} -valued spacetime 2-form B and a G-connection A, and construct the action

$$S = rac{1}{2} \int_M d^4 x \operatorname{Tr}(B \wedge F),$$

where $F = dA + \frac{1}{2}A \wedge A$ is the curvature of A.

Some notable features:

- Equation of motion for B implies F = 0, i.e. A is flat the theory is topological.
- The action is diffeomorphism invariant, but the first class constraints of the theory generate G-valued gauge transformations of A and B only.

Take a Lie group G and its associated Lie algebra \mathfrak{g} and a spacetime manifold M. Consider a \mathfrak{g} -valued spacetime 2-form B and a G-connection A, and construct the action

$$S = rac{1}{2} \int_M d^4 x \operatorname{Tr}(B \wedge F),$$

where $F = dA + \frac{1}{2}A \wedge A$ is the curvature of A.

Some notable features:

- Equation of motion for B implies F = 0, i.e. A is flat the theory is topological.
- The action is diffeomorphism invariant, but the first class constraints of the theory generate *G*-valued gauge transformations of *A* and *B* only. Hence, canonical quantization of the theory is easy.

Horowitz, Commun. Math. Phys. 125, 417-437 (1989).

Given an $\mathfrak{su}(2)$ -valued triad e_a^i and connection A_a^i ($a \in \{1, ..., 4\}$) on a 4d spacetime M, consider the generally covariant action

$$S = rac{1}{2} \int_{M} d^4 x \operatorname{Tr}(e \wedge e \wedge F)$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Given an $\mathfrak{su}(2)$ -valued triad e_a^i and connection A_a^i ($a \in \{1, ..., 4\}$) on a 4d spacetime M, consider the generally covariant action

$$S = \frac{1}{2} \int_{M} d^4 x \operatorname{Tr}(e \wedge e \wedge F)$$

Contrast with the 4d Palatini action for GR: $\mathfrak{so}(3, 1)$ -valued *tetrads* replaced with $\mathfrak{su}(2)$ -valued *triads*.

Given an $\mathfrak{su}(2)$ -valued triad e_a^i and connection A_a^i ($a \in \{1, ..., 4\}$) on a 4d spacetime M, consider the generally covariant action

$$S = \frac{1}{2} \int_{\mathcal{M}} d^4 x \operatorname{Tr}(e \wedge e \wedge F)$$

Contrast with the 4d Palatini action for GR: $\mathfrak{so}(3, 1)$ -valued *tetrads* replaced with $\mathfrak{su}(2)$ -valued *triads*.

Contrast also with *BF* theory, where $e \wedge e$ is replaced with an $\mathfrak{su}(2)$ -valued 2-form *B*.

Husain and Kuchar, Phys. Rev. D 42, 4070 (1990).

Assuming $M = \mathbb{R} \times \Sigma$, the canonical decomposition of the action is straightforward:

$$S = \int dt \int_{\Sigma} d^3 x (\tilde{E}^a_i \dot{A}^i_a - A^i_0 \tilde{G}_i - (e^i_0 E^a_i) \tilde{C}_a)$$

where $\tilde{E}_{i}^{a} = \det(e)E_{i}^{a} = \tilde{\epsilon}^{0abc}\epsilon_{ijk}e_{b}^{j}e_{c}^{k}$, and

$$\begin{split} \tilde{G}_i &= -D_a \tilde{E}_i^a pprox 0 \quad \mbox{(Gauss)} \\ \tilde{C}_a &= \tilde{E}_i^b F_{ab}^i pprox 0 \quad \mbox{(spatial diffeos)} \end{split}$$

Assuming $M = \mathbb{R} \times \Sigma$, the canonical decomposition of the action is straightforward:

$$S = \int dt \int_{\Sigma} d^3 x (\tilde{E}^a_i \dot{A}^i_a - A^i_0 \tilde{G}_i - (e^i_0 E^a_i) \tilde{C}_a)$$

where $\tilde{E}_{i}^{a} = \det(e)E_{i}^{a} = \tilde{\epsilon}^{0abc}\epsilon_{ijk}e_{b}^{j}e_{c}^{k}$, and

$$\begin{split} \tilde{G}_i &= -D_a \tilde{E}_i^a pprox 0 \quad \mbox{(Gauss)} \\ \tilde{C}_a &= \tilde{E}_i^b F_{ab}^i pprox 0 \quad \mbox{(spatial diffeos)} \end{split}$$

No Hamiltonian constraint!

Assuming $M = \mathbb{R} \times \Sigma$, the canonical decomposition of the action is straightforward:

$$S = \int dt \int_{\Sigma} d^3 x (\tilde{E}^a_i \dot{A}^i_a - A^i_0 \tilde{G}_i - (e^i_0 E^a_i) \tilde{C}_a)$$

where $\tilde{E}_{i}^{a} = \det(e)E_{i}^{a} = \tilde{\epsilon}^{0abc}\epsilon_{ijk}e_{b}^{j}e_{c}^{k}$, and

$$\begin{split} \tilde{G}_i &= -D_a \tilde{E}_i^a pprox 0 \quad (\text{Gauss}) \\ \tilde{C}_a &= \tilde{E}_i^b F_{ab}^i pprox 0 \quad (\text{spatial diffeos}) \end{split}$$

No Hamiltonian constraint!

The theory is non-dynamical: the geometry of Σ does not evolve. But not topological: local degrees of freedom exist.

Assuming $M = \mathbb{R} \times \Sigma$, the canonical decomposition of the action is straightforward:

$$S = \int dt \int_{\Sigma} d^3 x (ilde{E}^a_i \dot{A}^i_a - A^i_0 ilde{G}_i - (e^i_0 E^a_i) ilde{C}_a)$$

where $\tilde{E}_{i}^{a} = \det(e)E_{i}^{a} = \tilde{\epsilon}^{0abc}\epsilon_{ijk}e_{b}^{j}e_{c}^{k}$, and

$$\begin{split} \tilde{G}_i &= -D_a \tilde{E}_i^a pprox 0 \quad (\text{Gauss}) \\ \tilde{C}_a &= \tilde{E}_i^b F_{ab}^i pprox 0 \quad (\text{spatial diffeos}) \end{split}$$

No Hamiltonian constraint!

- The theory is non-dynamical: the geometry of Σ does not evolve. But not topological: local degrees of freedom exist.
- ► There's an invertible spatial metric g_{ab} = δ_{ij}eⁱ_ae^j_b, a, b ∈ {1, 2, 3}. Thus interesting three-geometries exist.

Consider the replacement

$$e^i_{a}
ightarrow D_{a} \phi^i$$

where D is the covariant derivative with connection A and ϕ is an $\mathfrak{su}(2)$ -valued scalar.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Enter HK2.0

Consider the replacement

$$e^i_a
ightarrow D_a \phi^i$$

where D is the covariant derivative with connection A and ϕ is an $\mathfrak{su}(2)$ -valued scalar.

The action now decomposes as

$$S = \int dt d^{3}x (\tilde{E}_{i}^{a} \dot{A}_{a}^{i} + \tilde{p}_{i} \dot{\phi}^{i} - A_{0}^{i} \tilde{G}_{i});$$

$$\tilde{E}_{i}^{a} = \tilde{\epsilon}^{abc} \epsilon_{ijk} D_{b} \phi^{j} D_{c} \phi^{k}, \quad \tilde{p}_{i} = \tilde{\epsilon}^{abc} \epsilon_{ijk} D_{a} \phi^{j} F_{bc}^{k}$$

No Hamiltonian and diffeomorphism constraints!

The theory is generally covariant. But the first-class constraints of the theory (namely, the Gauss law) generate only SU(2) transformations of the gauge field A. Where does the remaining gauge redundancy go?

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

The theory is generally covariant. But the first-class constraints of the theory (namely, the Gauss law) generate only SU(2) transformations of the gauge field A. Where does the remaining gauge redundancy go?

This is a common occurrence in a large class of generally covariant theories of connections, e.g. 2+1 gravity, BF theories, Chern-Simons theory, and so on.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

The theory is generally covariant. But the first-class constraints of the theory (namely, the Gauss law) generate only SU(2) transformations of the gauge field A. Where does the remaining gauge redundancy go?

This is a common occurrence in a large class of generally covariant theories of connections, e.g. 2+1 gravity, BF theories, Chern-Simons theory, and so on.

In these theories, for any generator of diffeomorphisms v,

 $\mathcal{L}_{v}A = G$ -transformations + equations-of-motion terms

where G is the gauge group of the connection A.

Horowitz, Commun. Math. Phys. 125, 417-437 (1989). Witten, Nuclear Physics B311 (1988/89) 46-78. Henneaux and Teitelboim, *Quantization of Gauge Systems*. Princeton University Press, 1992.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

In particular, the equations of motion for HK2.0 are

$$[F, \phi] = 0, \qquad [[F, \phi], D\phi] + [\phi, [D\phi, F]] = 0$$

In particular, the equations of motion for HK2.0 are

$$[F, \phi] = 0,$$
 $[[F, \phi], D\phi] + [\phi, [D\phi, F]] = 0$

Though the full story is a bit more subtle, essentially, if the first equation is required to hold, it can be shown that diffeomorphisms are equivalent to SU(2) gauge transformations.
